NOVEMBER RED MEAT PRODUCTION

Montana slaughter plants produced 1.3 million pounds of red meat in November 1989. This production is up 5 percent from last month, but down 7 percent from November 1988.

The number of cattle slaughtered, at 1,600 head, is the same as last year. Average liveweight of cattle slaughtered was 942 pounds, down 63 pounds from last November.

Hog slaughter, at 2,200 head, is down 500 head from last year. Average liveweight of hogs slaughtered, at 230 pounds, was down 1 pound from last year.

Commercial red meat production for the United States in November 1989 totaled 3.41 billion pounds, slightly above November 1988. January-November red meat production, at 36.2 billion pounds, was nearly the same as last year. The percentage changes for 1989 accumulated production by individual components were: beef, down 2; veal, down 10; pork, up 2; lamb and mutton, up 4. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

STATISTICAL REPORTS BENEFIT PRODUCERS

Dear Reporters:

Recently, we've heard concerns about comments an Iowa State economist made to the Northern Plains Resource Council regarding statistical reports--saying they benefit large companies more than producers. Nearly all economists who have studied this issue say the opposite. They say producers would be hurt most by elimination of statistical information because big businesses collect information for themselves.

Furthermore, buyers also fill out our reports providing marketing data that's vital to farmers and ranchers. For example, we collect and publish statistics on grain stocks, grain movement, cold storage stocks, crop sales, livestock slaughter, and commodity prices. This information helps producers make better marketing decisions. Mike Sands (Western Livestock Information Project) said, "Eliminating NASS (National Agricultural Statistics Service) reports would likely increase volatility and lower general price levels."

To continue providing unbiased, accurate data, we need your help and would appreciate your continued voluntary cooperation. About 1500 Montana livestock producers will be contacted between January 2 and 11 to provide data on 1990 cattle and sheep numbers.

If we have not answered your concerns about survey participation, we urge you to talk with Montana farm and ranch organizations. Most have resolutions on their books supporting our surveys. Also, talk to our Montana State University economists. They, too, believe that farmers and ranchers benefit from statistical reports. They're at 994-3701. Above all, talk with us--let us know how you feel, your comments and suggestions are important--call 449-5303 collect.

Best of luck in the New Year!

Lyle Pratt

Lyle H. Pratt, State Statistician

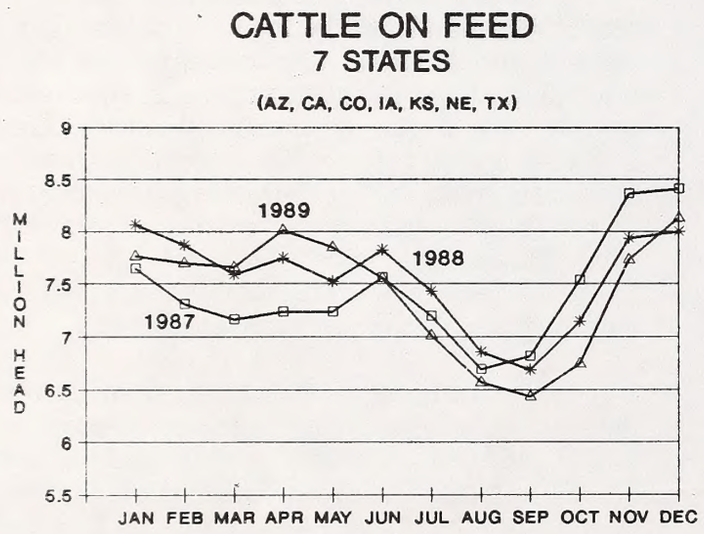
CATTLE ON FEED IN 7 STATES UP 2 PERCENT FROM LAST YEAR

Cattle and calves on feed December 1, 1989, for slaughter market in the 7 states preparing monthly estimates totaled 8.13 million head, up 2 percent from a year ago but 3 percent below December 1, 1987.

Marketings of fed cattle during November totaled 1.50 million, fractionally below last year but 1 percent above two years ago.

Placements of cattle and calves on feed in the 7 States during November totaled 1.99 million, up 18 percent from last year and 22 percent above November 1987. This is the largest November placement total since 1977, and the result of cattle moving into feedlots rather than going onto wheat pastures. Net placements of 1.90 million for November is 20 percent above last year and 24 percent above 1987.

Other disappearance totaled 91.0 thousand head compared to 107 thousand in November 1988 and 103 thousand in November 1987.



U.S. NOVEMBER MILK PRODUCTION

Milk production in the 21 major States during November totaled 9.69 billion pounds, 1 percent below production in these same states in November 1988. October revised production, at 9.92 billion pounds, was 2 percent below October 1988. Production per cow in the 21 major States averaged 1,138 pounds for November, 2 pounds less than November 1988.

The number of cows on farms in the 21 major States was 8.51 million head, 76 thousand head less than November 1988 but 21 thousand head more than October 1989.

During the July-September period, the 21 major States produced 30.2 billion pounds of milk, 84.9 percent of the U.S. production. If producers in the remaining 29 States not surveyed monthly followed the same pattern as the 21 States, the U.S. production would be 11.4 billion pounds for November 1989.

MONTANA EGG PRODUCTION UP

Montana laying flocks produced 45 million eggs in the September through November quarter, 5 percent more than the previous year's final quarter. Layers for the 1989 quarter averaged 690,000 compared with 725,000 for the same quarter in 1988.

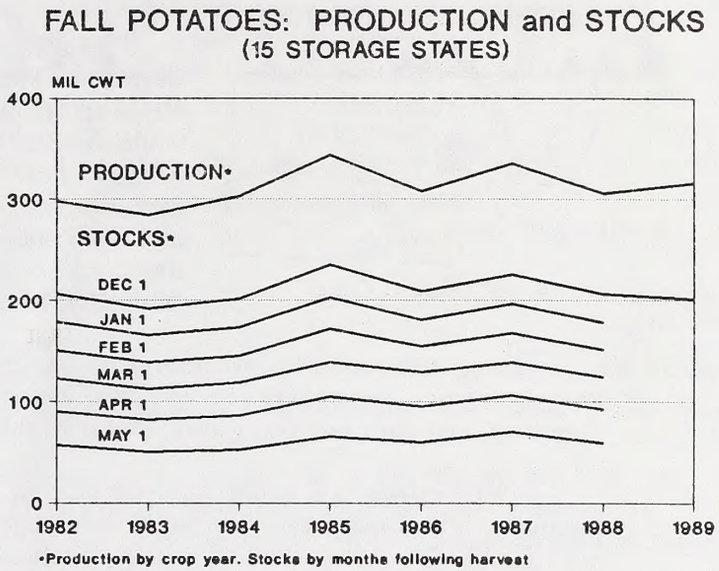
The rate of lay in the 1989 quarter was 72 eggs per 100 layers compared with 64.9 eggs per 100 layers in the 1988 quarter.

The nation's laying flocks produced 16.6 billion eggs during the September through November quarter, down 3 percent from the corresponding quarter a year ago. Production included 14.5 billion for table eggs and 2.12 billion for hatching eggs. Layers for the quarter averaged 268 million, down 3 percent from the 275 million a year ago.

All layers in the U.S. on December 1, 19[illegible] totaled 269 million, compared with 275 million a year ago. The 269 million layers consisted of 230 million layers producing table or commercial type eggs and 39.1 million layers producing hatching type eggs. Rate of lay per day on December 1, 1989 averaged 69.4 eggs per 100 layers compared with 68.8 for December 1, 1988 and 67.6 on November 1, 1989.

A big "THANK YOU" to all who participated in our December end of year crop survey. Survey results including final acreage, yield, and production for 1989 crops, December 1 grain stocks and 1990 winter wheat seedings will be published on January 11, 1990.

DECEMBER 1 POTATO STOCKS



Montana producers have 2,100,000 cwt of potatoes in storage as of December 1, compared with 2,020,000 cwt on hand a year ago. The December 1 stocks represents 94 percent of the 2,228,000 cwt produced during 1989.

Fall potato stocks in the **15 major States** were set at 201 million cwt on December 1, 1989. That's a drop of 2 percent from last year and 11 percent below two years ago. Stocks accounted for 64 percent of fall production this year compared with 68 percent a year ago, indicating heavier movement this year. By type, reds were 3 percent of December stocks, whites were 16 percent, and russets 81 percent.

Six western States stored a total of 141 million cwt of potatoes this year, 4 percent below a year ago and 6 percent below 1987. Oregon dropped 10 percent from 1988; while Washington was off 6 percent and Idaho dropped 5 percent. Colorado was up 6 percent; California and Montana gained 3 and 4 percent, respectively.

Disappearance from harvest time to December 1 was a record 115 million cwt up 16 percent from last year and 5 percent above two years ago. Shrink and loss at 14.5 million cwt so far was down 4 percent from last year's 15.1 million cwt and 10 percent below 1987.

Processing claimed a record 54.2 million cwt of fall potatoes this season to date, up 19 percent from last year and 13 percent above two years ago.

featuring...*CASCADE COUNTY*

Cascade County was created in December of 1887 and lies in central Montana. The county is criss-crossed by numerous rivers and streams. The Missouri River enters along the western border and flows northeasterly through the county, while the Smith River enters along the southern boundary and flows north to join the Missouri near Ulm, Montana. The Sun River enters along the northwestern border and joins the Missouri near Great Falls. The terrain is characterized by rolling plains and river valley, except for the extreme southeastern corner that is mountainous and timbered. A section of the Lewis & Clark National Forest is nestled there, and the Little Belt Mountains lie along the southern border. Great Falls is the county seat.

Being well suited to agricultural production, Cascade County supports a variety of agricultural interests. In 1988 crop production, the county ranked 5th in winter wheat, 10th in barley, 22nd in durum wheat, and 18th in spring wheat. Hay, oats, and corn are also grown. Most of the cropland is not irrigated.

Cattle raising is a major livestock interest as Cascade County came in 12th in the state in the January 1, 1988 inventory. The sheep inventory on the same date showed the county in 16th place, and the December 1 1987 hog count put Cascade 6th among the hog raising counties.

Cash receipts from the sale of crops added to $19,318,000 in 1987. Livestock receipts were $43,591,000, while government payments came to $11,035,000. Cash receipts total for 1987 amounted to $73,944,000, 3rd highest in the state.

ISSUE: 89-24 (0279-0394)
RELEASED: DECEMBER 19, 1989

The 1980s are rapidly winding down and the 1990s are nearly upon us. Looking back on the '80s we saw high volatility in Montana agriculture. We saw records set for wheat and barley production along with economic adversity for many and sparse production in 1985 and '88 due to drought. Looking ahead, we're optimistic for a growing demand for food and improved returns for producers.

A big "Thank You" to our many Montana producers who voluntarily take time to answer our requests for survey information. In turn, our staff is dedicated to providing you with the best information available to help you make those difficult decisions. We look forward to serving you in the 1990s.

PLEASE RETURN

Merry Christmas and Happy New Year from our Office Staff!

OCTOBER U.S. MANUFACTURED DAIRY

Butter production was 92.7 million pounds, virtually unchanged from October 1988 but 13 percent above September 1989. American type cheese production totaled 207 million pounds, 6 percent below October 1988 but 3 percent above September 1989. Total cheese output (excluding cottage cheese) was 453 million pounds, 4 percent below October 1988 but 1 percent above September 1989.

Creamed cottage cheese production was 45.3 million pounds, 10 percent below October 1988 and 2 percent below September 1989. Lowfat cottage cheese production was 24.0 million pounds, 3 percent above October 1988 but 2 percent below September 1989.

Canned evaporated and condensed whole milk, 37.3 million pounds, 13 percent below October 1988 and 1 percent below September 1989.

Frozen desserts: (comparisons with October 1988) Ice cream (hard)--60.2 million gallons, virtually unchanged. Ice milk-- 26.9 million gallons, up 3 percent. Sherbet (hard)--3.17 million gallons, down 6 percent.

1989 BULLETIN NOW AVAILABLE

The 1989 Centennial Issue of Montana Agricultural Statistics is now available for distribution. It contains a statistical record of Montana's agriculture. The primary purpose of the bulletin is to provide those interested in Montana's agriculture industry with a single publication that covers state and county crop and livestock production.

It also features farm income, numbers of farms and weather data, along with production statistics for the past ten years. The demand for accurate, reliable statistical data continues to grow.

Farm programs and the marketing system depend on information for fair prices and equitable programs. Agri-businesses want to know about Motnana agriculture before investing in our state!

For more information about obtaining a copy of this year's bulletin, call or write to the Montana Agricultural Statistics Service at (406) 449-5303, P.O. Box 4369, Helena, MT 59604. The bulletin is free to those who report information to us, but costs $5.00 for all others. Make checks payable to the Montana Department of Agriculture at the above address.

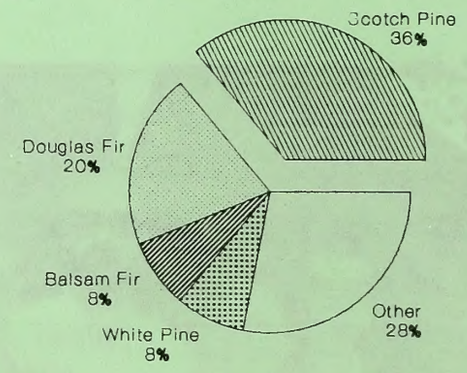
'TIS THE SEASON

This year, Americans are expected to buy over 35 million Christmas trees. The nation's 15,000 commercial Christmas tree producers have more than 87 million trees of all ages planted on 1 million acres.

Last year's tree sales came to $680 million (wholesale value), putting Christmas trees ahead of several traditional ag commodities in total cash receipts. Growers received an estimated $12/tree while wholesalers got about $20.

Most trees are planted as seedlings on farms while about 10% come from natural stands. The top states in production are Oregon, Michigan, Wisconsin, North Carolina, Washington, and Pennsylvania.

AMERICA'S FAVORITE CHRISTMAS TREES
Percent of Christmas trees sold in 1988



NOVEMBER WARMER THAN NORMAL

The crop-weather situation for November held both good news and bad news depending on where you live. Precipitation amounts in southwestern and south central Montana were mostly below average in November. Most other areas of the state were above average.

Most of the moisture came in the form of rain. In fact, the worst flooding since 1975 hit the Flathead Valley. Kalispell, Thompson Falls, and Libby had over 3 inches of rain. Other stations with over double the normal precipitation were Cut Bank, Havre, Chester, Stanford, and Ingomar. November temperatures averaged 2 to 6 degrees above normal for the month. The winter wheat crop looks quite good--with just light wind damage, but we need more snow to protect the crop.

A look at the livestock situation shows most livestock were still grazing at lower elevations in November. This has helped conserve the hay supply as only about one-third of the livestock were receiving supplemental feed. We're hoping good snow cover is forthcoming to provide soil moisture and protect the winter wheat crop.

NOVEMBER AG PRICES RECEIVED

Prices received by Montana farmers for wheat and barley increased slightly during November, while most hay and livestock prices were lower. Montana's mid-November all wheat price, at $3.74 per bushel, compares with $3.71 in October and $3.98 a year ago. Hay prices in November dropped to $66.00 per ton compared with $69.00 a month ago and $89.00 a year ago. Steer and heifer prices received, at $82.60 per hundredweight, were $1.10 below October but $3.50 above last year. Calf prices, at $87.50, were down $1.50 from a month ago and down $3.60 from a year ago.

The November index of prices received by Montana farmers and ranchers for all farm products at 173 (1977=100) was down 9 points from October and down 7 points from November 1988. The all crops index, at 153, was up 1 point from October but down 20 points from last year. The livestock and products index at 193 was 18 points under October but 6 points above last year.

For the U.S., the November all farm products index of prices received decreased 2 points from October to 147 percent of its January-December 1977 average. The index was 3 points above a year ago. Prices for milk, hogs, cattle, and eggs were the major contributors to the increase over a year earlier, but lower prices for soybeans, corn, and broilers were partially offsetting.

Feed grain prices, except oats, increased slightly from October. Wheat, rice, and soybeans also showed small gains. Hog prices decreased from October, steers and heifers were up, but prices for cows and calves were down.

Merry Christmas!
and
Happy New Year!

featuring...*CARTER COUNTY*

Carter County is situated in the extreme southeastern corner of the state, bordered on the east by South Dakota and to the south by Wyoming. The landscape is characterized largely by rolling prairie with the exception of some territory in the northwest and north central area of the county that is occupied by sections of the Custer National Forest. The Little Missouri River meanders through the southeastern corner of the county.

In 1988, Carter County was the number one sheep raising county in the state. In number of cattle for 1988, the county was in 14th place. Some hogs are also raised--Carter County stood 36th in the December 1, 1987 hog inventory.

Principal crops raised include wheat, hay, barley, and oats. In the 1988 crop production figures, the county stood in 43rd, 49th, 51st, and 52nd place respectively for these crops.

Livestock returned $16,975,000 in cash receipts to the county in 1987, while crops added $3,060,000. Government payments amounted to $3,823,000 for a total return of $23,858,000 in 1987 cash receipts.

OCTOBER RED MEAT PRODUCTION

Montana slaughter plants produced 1.2 million pounds of red meat in October 1989. This production is up 10 percent from last month, but down 16 percent from October 1988.

The number of cattle slaughtered, at 1,400 head, is down 200 head from last year. Average liveweight of cattle slaughtered was 1,014 pounds, up 4 percent from last year. Hog slaughter, at 2,400 head, is down 600 head from last year. Average liveweight of hogs slaughtered was 232 pounds, down 5 percent from a year ago.

Commercial red meat production for the United States in October 1989 totaled 3.52 billion pounds, nearly the same as October 1988. January-October red meat production, at 32.8 billion pounds, was down 1 percent from last year. The percentage changes from 1989 accumulated production by individual components were: beef, down 2; veal, down 10; pork, up 2; lamb and mutton, up 3. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

CATTLE ON FEED IN 7 STATES DOWN 3 PERCENT FROM LAST YEAR

Cattle and calves on feed November 1, 1989, for slaughter market in the 7 States preparing monthly estimates totaled 7.73 Million head, down 3 percent from a year ago and 8 percent below November 1, 1987.

Marketings of fed cattle during October totaled 1.63 million, up 2 percent from last year but 4 percent below two years ago.

Placements of cattle and calves on feed in the 7 States during October totaled 2.68 Million, up 8 percent from last year and 3 percent above October 1987. Net placements of 2.61 million for October is 9 percent above last year and 3 percent above 1987.

Other disappearance totaled 71 thousand head compared to 84 thousand in October 1988 and 85 thousand in October 1987.

U.S. OCTOBER MILK PRODUCTION

Milk production in the 21 major States during October totaled 9.93 billion pounds, 2 percent below production in these same states in October 1988. September revised production, at 9.74 billion pounds, was 2 percent below September 1988. Production per cow in the 21 major States averaged 1,169 pounds for October, 10 pounds below October 1988.

The number of cows on farms in the 21 major States was 8.49 million head, 99 thousand head below October 1988 but 18 thousand head above September 1989.

During the July-September period, the 21 major States produced 30.2 billion pounds of milk, 85 percent of the U.S. production. If producers in the remaining 29 states not surveyed monthly followed the same pattern as the 21 States, the U.S. production would be 11.7 billion pounds for October 1989.

FARM WAGES AVERAGED $5.42 FOR OCTOBER

A total of 3.38 million persons worked on the nation's farms and ranches during the week of October 8-14, 1989. This number compares with 3.19 million workers during the comparable week in 1988. The workforce was comprised of 1.54 million self-employed farm operators, 549,000 unpaid workers, and 983,000 workers hired directly by farm operators. Rounding out the total were 308,000 agricultural service employees doing work on farms and ranches during the survey week.

The all hired farm worker wage rate for the October 1989 survey week averaged $5.42 per hour, up 24 cents from a year earlier. Workers paid on an hourly basis earned $5.23 per hour compared with $4.94 last October. Wage rates for field and livestock workers were $5.22 and $4.76, respectively. During October 1988, field workers made $4.95 while livestock workers averaged $4.70 per hour.

During the current survey week, self-employed persons worked an average of 42.5 hours, 1.9 fewer hours than in the comparable week in 1988. Unpaid workers, who worked 15 hours or more during the week, put in 40.2 hours compared with 36.8 hours a year earlier. Hired workers spent an average of 42.3 hours doing agricultural work, up 0.4 hour from October of last year.

Benefits, such as housing and meals, were provided to 42 percent of the hired workers during the survey week. Last year 44 percent of the workforce received benefits in addition to cash wages. Housing was furnished to 20 percent of the workers, compared with 23 percent a year ago.

U.S. OCTOBER EGG PRODUCTION DOWN 3 PERCENT

U.S. egg production totaled 5.65 billion during October 1989, down 3 percent from the 5.83 billion produced a year ago. Production included 4.93 billion for table eggs and 719 million for hatching eggs. The total number of layers during October averaged 269 million, down 2 percent from the 276 million a year ago. October egg production per 100 layers was 2,102 eggs, compared with 2,117 in October 1988.

All layers in the U.S. on November 1, 1989 totaled 270 million, compared with 276 million a year ago. The 270 million layers consisted of 232 million layers producing table or commercial type eggs and 38.7 million layers producing hatching type eggs. Rate of lay per day on November 1, 1989 averaged 67.6 eggs per 100 layers, down 2 percent from last year's 68.7 eggs per 100 layers.

U.S. TURKEY POULTS PLACED UP 26 PERCENT

Turkey eggs in incubators on November 1, 1989, totaled 27.2 million, 14 percent above the 23.8 million a year earlier. The 20.1 million poults placed during October 1989 in the United States were 20 percent above placements during the same month a year ago.

POTATO CROP UP FROM LAST YEAR

Montana's 1989 potato crop was a good one. The overall yield of 300 sacks per acre was matched by only one other year--1987. Of course, potato acreage in Montana is relatively small (only 7,800 acres harvested this past year). Still, it is a very important crop in that almost the entire production is used for seed.

No major crop in Montana grosses more per acre than potatoes which has been over $2,000 the last few years. Sugar beets, the second highest gross per acre, has been under $1,000.

The most important aspect of Montana potatoes is that they are used to seed between 40-45,000 acres--mostly in Washington and Idaho (about 20% of the total acreage in those two states.) And, because Montana seed potatoes are practically disease free, the production in those two states is significantly boosted.

Potatoes in Montana are raised in the mountain valleys of western Montana with the largest acreage in the Flathead, Mission, Deer Lodge, Gallatin, Beaverhead, and Madison valleys.

For the **Nation**, production of fall potatoes is forecast at 323 million hundredweight, which is up 3 percent from last year, but 6 percent below 2 years ago.

PLANTINGS FOR 1990: A TICKLISH DECISION

A few years ago, U.S. grain surpluses were so big that much effort went into devising new ways to store them. Now, instead of surpluses being parked in abandoned silica sand mines and in barges along the Mississippi, some analysts are concerned about adequate food reserves.

The 1988 drought, coupled with government acreage reduction requirements, cut U.S. grain production substantially in 1988-89. Higher prices and lower acreage reduction requirements encouraged farmers to increase plantings for this year, the 1989-90 season.

But unfavorable weather in some regions is holding production down from its potential. While both U.S. and world production of most crops is rising in 1989-90, demand is strong and stocks are expected to continue falling.

Consequently, food grain prices are continuing up. These higher prices are signals to farmers to increase production. And USDA has again loosened wheat acreage reduction requirements for 1990-91, making it easier for farmers to continue expanding.

NEED BIG IMPROVEMENTS TO FEED A HUNGRY WORLD

The world we live in is ever changing and those changes are more likely to impact us! With supersonic airplanes and satellite communications the world is in our backyard. That's why we must be concerned about the world's hunger problem.

The world now has over 5 billion people. Projections call for an additional 3 billion people in 35 years. That means that we must increase agricultural production by 60 percent just to stay even with current worldwide consumption and we know that many who can't afford food are starving right now, so even more food is needed. We'll be challenged to meet our nation's needs plus continue to sell at least the current 1/3 of our production overseas.

That means emphasis on ways to improve productivity of high quality food with safeguards for our environment. This will require investment in research and technology. Those working on bio-tech and other research have the potential to make big improvements, to provide the tools to help our farmers feed a hungry world.

featuring...*CARBON COUNTY*

Carbon County, situated in the South Central portion of Montana, was established in March of 1895. It's northern boundary is marked by the Yellowstone River while the southwestern corner of the county is covered with part of the Custer National Forest and the Beartooth Mountain Range. Several unnamed mountain peaks in this range within Carbon County's boundaries boast elevations above 13,000 feet.

Coal mining was the chief industry in Carbon County early on, but today agriculture is the prominent business. With a land area of 1,315,801 acres, Carbon County ranked 7th for hay production and 4th for oat production in Montana for 1988. Other principal crops include barley, wheat, corn, and sugar beets. On January 1, 1988, the county ranked 11th in sheep numbers and 16th for cattle numbers in Montana.

Carbon County returned $38,802,000 in cash receipts from marketings and government payments for the 1987 crop year. Crops contributed $13,422,000 to that total; livestock and livestock product sales added $22,719,000; and government payments made up the remaining $2,661,000. In 1987 Carbon County ranked 14th in Montana for all products cash receipts, livestock and products receipts ranked 11th and crops, 16th.

Red Lodge, the largest town in the county, is the county seat. The main agricultural areas are the Clark Fork and the Rock Creek Valleys, with important ranching activity in surrounding areas.

MONTANA'S PASTURE AND RANGE FEED CONDITION ON NOVEMBER 1

Montana's pasture and range feed condition rating of 84 is 47 points higher than a year ago at this time. The eastern counties of Montana are suffering from the effects of drought although conditions are much improved over a year ago. Pastures and ranges were still providing grazing on November 1, and movement of livestock from summer ranges was behind average.

MONTANA, November 1, 1989
Pasture and Range Feed Condition
By Districts as a Percent of Normal

DISTRICT	1987	1988	1989

South Central	75	41	90
Southeast	84	22	78
STATE	78	37	84

SEPTEMBER U.S. MANUFACTURED DAIRY

Butter production was 82.1 million pounds in September, 1 percent below September 1988 but 3 percent above August 1989. American type cheese production totaled 200 million pounds, 4 percent below September 1988 and 6 percent below August 1989. Total cheese output (excluding cottage cheese) was 447 million pounds, 1 percent below September 1988 and 3 percent below August 1989.

Creamed cottage cheese production was 46.4 million pounds, 11 percent below both September 1988 and August 1989. Lowfat cottage cheese production was 24.5 million pounds, 2 percent below September 1988 and 10 percent below August 1989. Canned evaporated and condensed whole milk, 37.8 million pounds, 23 percent below September 1988 and 10 percent below August 1989.

Frozen desserts: (comparisons with September 1988) ice cream (hard)--66.3 million gallons, down 7 percent. Ice milk--30.9 million gallons, down 2 percent. Sherbet (hard)--4.00 million gallons, down slightly.

AG RESEARCH NEEDS A BOOST

Not long ago the United States was the dominant force in the world economy. We were richer and more productive than the rest of the world. After World War II we had over 50% of the world's gross national product. Not so today! We now have about 22% and we have become a debtor nation. In agriculture, along with other high tech industries, other nations have become much more competitive.

What can we do to re-establish superiority in the agricultural industry? According to a National Research Council board, more basic research is urgently needed to meet competition, to regain the leading edge in agricultural technology. USDA research funds have remained at a virtual standstill since 1955! They say about a half billion new dollars will be needed annually to boost innovation in science and technology. That's a lot of money--about the cost of one stealth bomber. In the past, return on ag research dollars have exceeded 45% per year--that's an investment return that we can't afford to pass up!

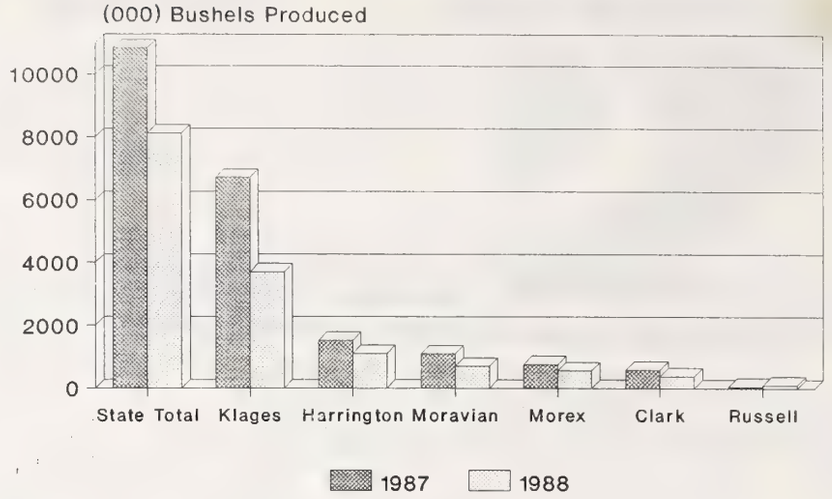
MONTANA MALTING BARLEY--1988 CROP

Maltsters and brewers purchased 8.1 million bushels of Montana's 1988 barley crop to make malt. This was 25 percent less than 1987 and 33 percent less than 1986. However, the 1988 barley utilization represented 27 percent of the total 1988 barley crop compared with 12 percent in 1987 and 14 percent in 1986.

Montana growers planted 1.8 million acres of barley in 1988. Of the total, about 370 thousand acres were planted to approved malting varieties. Because of extreme droughty conditions in 1988 it is assumed mainly irrigated production, with lower protein, would have qualified for malting grade. Malting utilization would, therefore, represent nearly 64 percent of the 12.7 million bushel total irrigated barley produced in 1988. However, part of the 8.1 million bushels used for malt could have come from stored old-crop barley.

MONTANA BARLEY VARIETIES USED TO PRODUCE MALT



This survey was requested and funded by the Montana Wheat and Barley Committee.

A special thanks to the maltsters, brewers, and grain firms who cooperated in furnishing data.

OCTOBER AG PRICES RECEIVED

The October 1989 index of prices received by **Montana** farmers and ranchers was down 2 points from last month and 6 points below October last year. The all farm products index at 179 percent of the 1977=100 base was pulled down by a 3-point decline in the livestock and products index. The all crops index remained unchanged.

Spring wheat, down 2 cents, and hay, down $1.00, were the only crops showing lower prices compared with the previous month. In the livestock commodities only hogs and milk were up from September. Mid-October average prices for cows were down $2.80; calves were off $1.80; sheep were down $5.30; and lambs were down $4.40 per cwt.

The October all farm products index of prices received by **U.S.** farmers increased 1 point from September to 144 percent of its January-December 1977 average. Increases in the prices of hogs, milk, lettuce, and tomatoes were partially offset by lower prices for broilers, soybeans, cattle, and corn. The index was also 1 point above a year ago. Prices for hogs, milk, and oranges were major contributors to the increase over a year ago, but lower prices for soybeans, corn, and broilers were partially offsetting.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for October was 178 percent of its 1977 average. The index was unchanged from July but 5 points above last year. Compared to July, prices were up for feeder livestock but down for feed and gasoline. Since last surveyed in April, prices generally rose for building and fencing materials and machinery but declined for fertilizer.

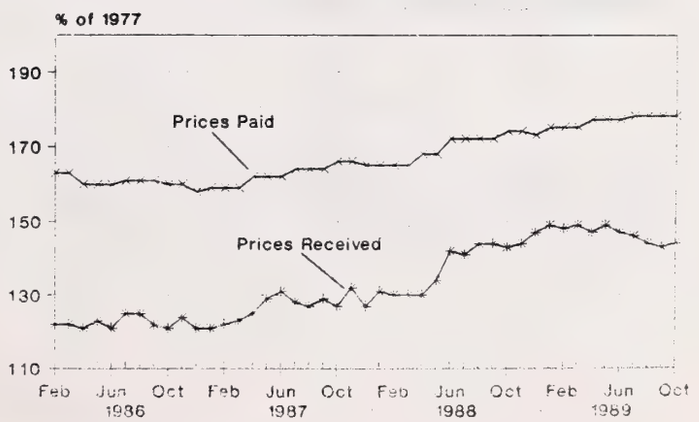
UNITED STATES INDEX NUMBERS OF PRICES PAID & PRICES RECEIVED



*featuring...*BROADWATER COUNTY

Broadwater County lies in central Montana. The Big Belt Mountains and the Helena National Forest run along the eastern border, and another part of the Helena National Forest lies along the western boundary. The Missouri River and Canyon Ferry Lake reach from the southern to the northern borders of the county. Aside from the mountainous landscape, the terrain is chiefly rolling foothills.

Cropland in Broadwater County includes both irrigated and non-irrigated acres, and a variety of crops abound. Barley, winter and spring wheat, oats, hay, and potatoes are all produced in the county. Cash receipts from the sale of crops totaled $7,002,000 in 1987 with a rank of 28.

Sheep, hogs, and cattle operations can all be found in the county. In the January 1, 1989 sheep and cattle inventories, Broadwater County ranked 28 and 40 respectively. In the December 1, 1987 hog inventory the county came in at 44. Livestock and livestock products contributed $7,546,000 in cash receipts in 1987 with a rank of 41. Government payments added $4,335,000 for a cash receipt total of $18,883,000 for Broadwater County in 1987.

CATTLE ON FEED DOWN 6 PERCENT IN 13 QUARTERLY STATES

Cattle and calves on feed October 1, 1989, for slaughter market in the 13 quarterly States totaled 8.06 million head, down 6 percent from October 1, 1988, and down 10 percent from 1987.

The cattle on feed inventory included 5.12 million steers and steer calves, 8 percent below last year and 13 percent below 1987. This group represented 63 percent of the total October number on feed, compared with 65 percent last year and 66 percent in 1987. Heifers and heifer calves accounted for 2.91 million, 3 percent below a year ago and 5 percent below 1987.

Placements of cattle and calves on feed during the July-September 1989 quarter totaled 5.69 million, down 5 percent from 1988 and 14 percent below 1987. **Other disappearance** of 227 thousand head leaves **net placements** at 5.46 million.

Marketings of fed cattle for slaughter during July-September totaled 5.86 million, 5 percent below 1988 and 3 percent below the same period in 1987.

Cattle feeders expect to market 5.37 million head during the October-December quarter of 1989. This would be down 2 percent from the fourth quarter marketings in 1988 and 4 percent below 1987.

SEPTEMBER RED MEAT PRODUCTION

Montana slaughter plants produced 1.1 million pounds of red meat in September 1989. Production was down 35 percent from last month, and down 22 percent from September 1988.

There were 1,200 head of cattle slaughtered, down 400 head from last year. Average liveweight of cattle slaughtered, at 988 pounds, compares with 1,010 pounds last September. Hog slaughter, at 2,400 head, is down 400 head from last year. Average liveweight of hogs slaughtered was 226 pounds.

Commercial red meat production for the United States in September 1989 totaled 3.32 billion pounds, down 4 percent from September 1988. January-September red meat production, at 29.3 billion pounds, was down 1 percent from September 1988. The percentage changes from 1988 accumulated production by individual components were: Beef, down 3; Veal, down 10, Pork up 3; Lamb and Mutton, up 2. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

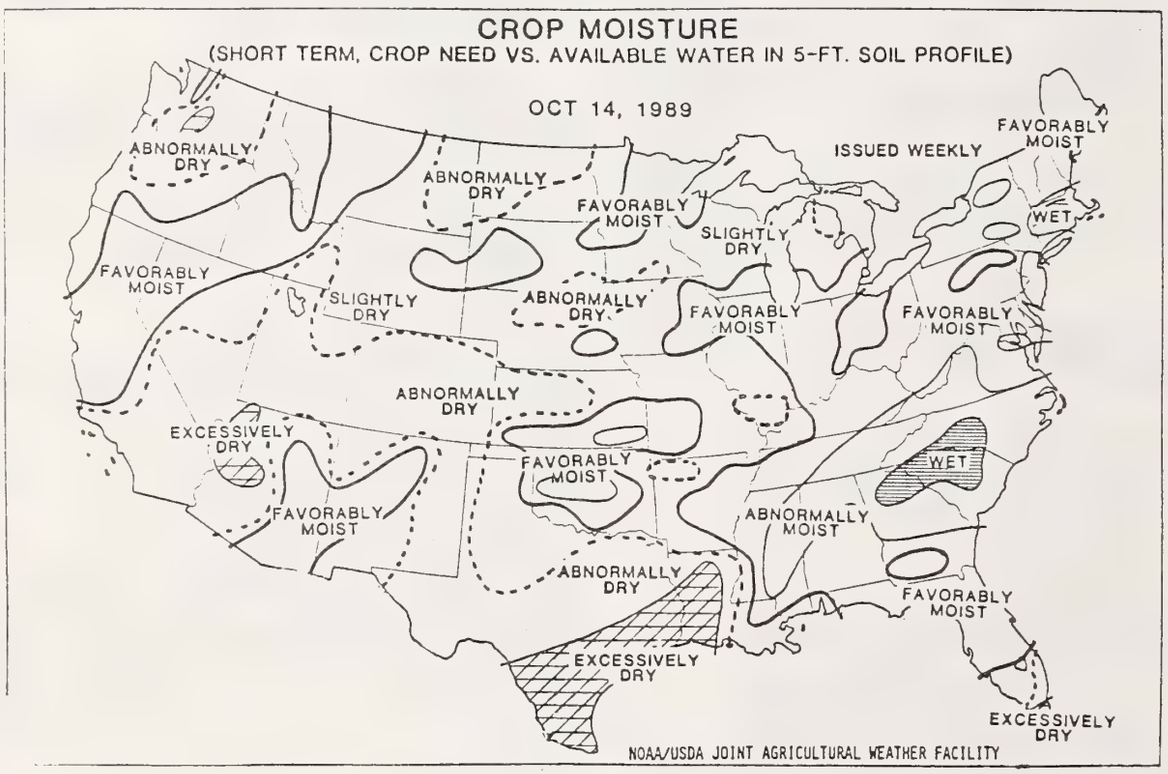
DRY WEATHER CONDITIONS CONTINUE--RAIN OR SNOW NEEDED

The October 24 crop-weather report shows a continuation of the dry fall weather. The conditions allowed Montana farmers to virtually complete winter wheat seeding and make good progress on potato and sugar beet harvest. The winter wheat crop looks very good with 3/4 of the crop emerged--ahead of the normal 60%. Condition at this early date is mostly good to excellent.

The only serious problem seems to be the abnormally dry soil situation in the eastern portion of the state. Both topsoil and subsoil moisture are critically short in many eastern areas. This means a good amount of fall rain or snow will be needed to recharge supplies.

Nationally, winter wheat seeding was 81% complete by mid-October, 9% ahead of normal. Fifty-seven percent had emerged--6% ahead of normal. Rain is needed to insure good crop development in Washington, Oregon, Texas, and the Great Plains.

A look at the A look at the **Montana** livestock situation shows that pasture and range conditions are still mostly good to excellent. Grass has done well this year and ranchers have kept stock on summer ranges a bit longer than normal. So far, about 2/3 of the cattle and 3/4 of the sheep and lambs have been moved from summer ranges.



COMPUTERS NOT WIDELY USED BY FARMERS

Less than 3 percent of U.S. farmers use computers for financial recordkeeping while 56 percent use general ledgers or notebooks.

Nearly 16 percent use some form of financial records workbook. That leaves 25 percent using "other methods" of recordkeeping, including 14 percent who use the proverbial "shoebox" or some similar informal system of keeping receipts, invoices, and bills of sale.

This information was gathered in the annual Farm Costs and Returns Survey (FCRS) covering operations of calendar year 1987.

The survey is conducted each year by USDA's National Agricultural Statistics Service (NASS) and its state offices.

Another finding in the survey was that less than 12 percent of farmers subscribe to farm financial recordkeeping services. The participants in the survey indicated about two-thirds of such services are provided by accountants.

Computer usage is not uniform throughout the farm sector. Nearly 15 percent of the operators of "large" farms (those with annual commodity sales of at least $250,000) used computers in 1987--and nearly 40 percent of that category used recordkeeping services.

QUARTERLY MILK PRODUCTION

July-September milk production for Montana was estimated at 89 million pounds, 2 percent less than produced during the same quarter last year. Milk cow numbers remained steady at 25,000 head.

Grain and other concentrates fed daily per cow averaged 14.6 pounds on October 1 compared with 15.5 a year earlier. The average value per 100 pounds of concentrate rations fed to milk cows was $6.80 down from $7.70 on October 1, 1988.

The quarterly production of milk for the U.S. was 35.5 billion pounds, 1 percent below July-September 1988.

The average number of milk cows in the U.S. during the July-September quarter was 10.1 million head, virtually unchanged from April-June 1989 but 1 percent less than July-September 1988.

Grain and other concentrates fed to milk cows on October 1, 1989, averaged 16.9 pounds, no change from October 1, 1988.

The value of grain and other concentrates fed to cows on October 1, 1989, averaged $8.08 per hundredweight, $0.24 per hundredweight less than the October 1, 1988 value.

OCTOBER U.S. EGG PRODUCTION DOWN 3 PERCENT

U.S. egg production totaled 5.43 billion during September 1989, down 3 percent from the 5.58 billion produced a year ago. Production included 4.74 billion for table and 696 million for hatching eggs. The total number of layers during September averaged 267 million, down 2 percent from the 274 million a year ago. September egg production per 100 layers was 2,036 eggs, compared with 2,039 in September 1988.

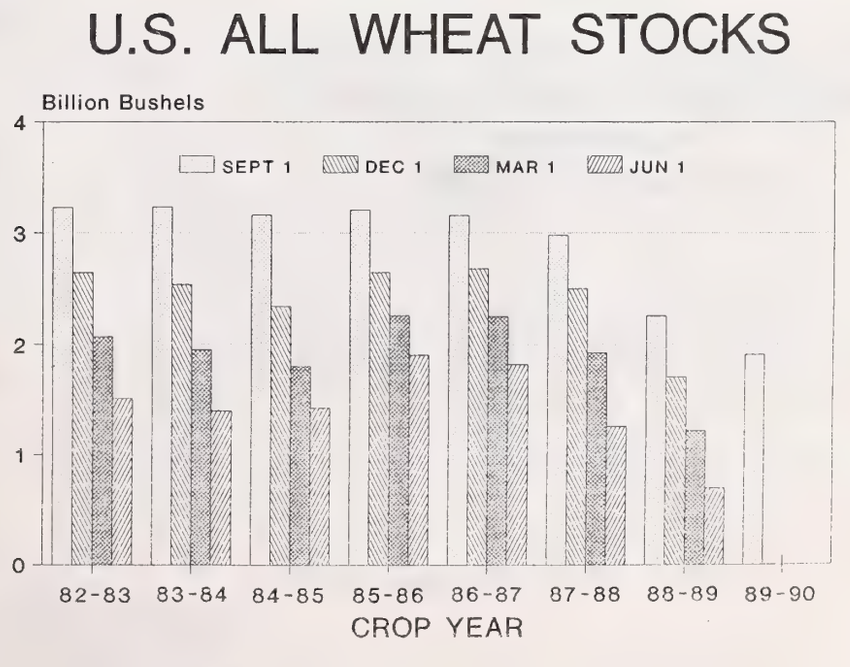
All layers in the U.S. on October 1, 1989 totaled 267 million, compared with 275 million a year ago. The 267 million layers consisted of 229 million for table or commercial-type eggs and 38.0 million for hatching-type eggs. Rate of lay per day on October 1, 1989 averaged 68.0 eggs per 100 layers, up fractionally from a year ago and up 1 percent from the 67.6 on September 1, 1989.

U.S. TURKEY POULTS PLACED UP 26 PERCENT

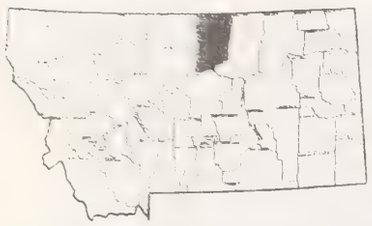
The turkey eggs in incubators on October 1, 1989, totaled 27.6 million, 26 percent above the 22.0 million a year earlier. The 19.9 million poults placed during September 1989 in the United States were 26 percent above the placements during the same month a year earlier.

U.S. ALL WHEAT STOCKS

U.S. all wheat in all storage positions September 1, 1989, is estimated at 1.91 billion bushels, down 15 percent from September 1, 1988. Of the total stocks, 822 million bushels were stored on-farms. This is up 3 percent from a year ago. Off-farm stocks total 1.09 billion bushels, 25 percent less than last September 1. The indicated disappearance from all positions for the quarter ending September 1, 1989, is 851 million bushels, up 4 percent from the comparable period in 1988.



*featuring...*BLAINE COUNTY



Blaine County was created in March of 1912 and occupies 2,724,736 acres in the North Central region of Montana. Its northern boundary comprises a portion of the Montana-Canada border. Half of its southern boundary is marked by the Missouri River, and the Milk River meanders the entire width of the county. The land in Blaine County is generally level, being broken in the Western and Southern regions by the Bear Paw Mountains. The Fort Belknap Indian Reservation occupies the southeastern corner of the county.

Primary crops raised in the county include wheat, oats, and barley. Blaine County ranked 10th in 1988 for all wheat production (12th for winter wheat production and 7th in spring wheat production), also 3rd in oats production and 18th in barley production. In 1988 livestock numbers, Blaine County ranked 10th in the cattle inventory, 26th for sheep, and 8th in the hog inventory.

Livestock and livestock products brought in $15,708,000 in cash receipts in 1987 with a rank of 21st. Crops contributed $12,451,000 for a place of 20th in the county rankings. Government payments totaled $12,028,000 for a cash receipt total of $40,187,000 in 1987.

Oct. 1 Crop Production

OCTOBER 1 CROP PRODUCTION

Montana's 1989 all wheat crop was forecast on October 1 at 149.1 million bushels, 2.1 million bushels less than the September 1 estimate. The reduction is due to 200 thousand fewer winter wheat acres harvested, which was partially offset by a higher winter wheat yield. Total winter wheat production is estimated at 54.0 million bushels, durum at 6.7 million, and hard spring wheat at 88.4 millon.

Barley production, at 68.8 million, is up 3.2 million from the September estimate due to an increase in per acre yield. Oats production, at 6.82 million bushels, is up 290 thousand bushels as yields were 2 bushels above September 1 reports. Montana's hay production estimate fell slightly during September due to a slightly smaller yield forecast for hay other than alfalfa.

For the **nation**, All wheat production for 1989 is estimated at 2.04 billion bushels, down 1 percent from the September 1 forecast but up 13 percent from 1988. Corn for grain production as of October 1, is forecast at 7.45 billion bushels, up 2 percent from last month and 51 percent above the drought-reduced crop of 1988. Production of all hay is forecast at 150 million tons. This is 4 percent more than expected August 1 and 19 percent above the quantity produced in 1988.

U.S. HOG INVENTORIES UP SLIGHTLY

Inventory of all hogs and pigs in the U.S. on September 1, 1989 is estimated at 58.4 million head. This is slightly above September 1, 1988.

-- **Breeding inventory** at 7.02 million head is down 3 percent from September 1, 1988.

-- **Market hog inventory** at 51.4 million head is 1 percent above September 1, 1988.

The June-August 1989 **U.S. pig crop** was 23.8 million head, 1 percent above 1988. Sows farrowing during this period totaled 3.04 million head, 1 percent below a year earlier. Pigs saved per litter was 7.80 compared to 7.62 during the same period in 1988.

U.S. hog producers intend to have 2.90 million sows farrow during the September-November quarter, 1 percent less than the actual farrowings during the same period last year but 1 percent above 1987.

U.S. farrowing intentions for the December 1989-February 1990 quarter, at 2.68 million sows, is virtually unchanged from 1989 and 2 percent below the 1988 period.

The Montana crop production, grain stocks, and hog estimates in this issue of the Reporter are the result of surveying approximately 1,600 Montana farmers and ranchers during September. Names were selected on a statistical probability basis. For those operators that were called and responded to the questionnaire a SPECIAL THANKS. Only by your voluntary cooperation can those involved in agriculture be served with accurate, reliable statistics.

[1] Terminals, mills, interior elevators. [2] Montana stocks for winter wheat, all spring wheat and September barley separately are made possible through funds provided by the Montana Wheat and Barley Committee. [3] Included in all spring wheat and all wheat. [4] Not included in order to avoid disclosing individual operations. * Some data revised.

AUGUST U.S. MANUFACTURED DAIRY

Butter production was 80.1 million pounds in August, 8 percent above August 1988 and 11 percent above July 1989. American-type cheese production totaled 214 million pounds, 2 percent above August 1988 but 6 percent below July 1989. Total cheese output (excluding cottage cheese) was 460 million pounds, 4 percent above August 1988 but 1 percent below July 1989. Creamed cottage cheese production was 52.4 million pounds, 10 percent below August 1988 but 11 percent above July 1989. Lowfat cottage cheese production was 27.1 million pounds, 1 percent above August 1988 and 7 percent above July 1989.

Canned evaporated and condensed whole milk, at 42.0 million pounds, 15 percent below August 1988 and 1 percent below July 1989. Frozen desserts (comparisons with August 1988) were: Ice cream (hard)--79.0 million gallons, down 8 percent. Ice milk--38.4 million gallons, down 6 percent. Sherbet (hard)--4.71 million gallons, down 13 percent.

AUGUST RED MEAT PRODUCTION

Montana slaughter plants produced 1.7 million pounds of red meat in August 1989. This production is up 54 percent from last month, but down 1 percent from August 1988.

The number of cattle slaughtered, at 1,800 head, is down 200 head from last year. Average liveweight of cattle slaughtered, at 1,051, is up 9 percent from last year. Hog slaughter, at 3,100 head, is down 100 head from last year. Average liveweight of hogs slaughtered was 230 pounds, down 1 percent from a year ago.

Commercial red meat production for the United States in August 1989 totaled 3.48 billion pounds, down 1 percent from August 1988. January-August red meat production, at 26.0 billions pounds, was nearly the same as last year. The percentage changes from 1988 accumulated production by individual components were: Beef, down 2; Veal, down 9; Pork up 3; Lamb and Mutton, up 2. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

CATTLE ON FEED IN 7 STATES DOWN 4 PERCENT FROM LAST YEAR

Cattle and calves on feed September 1, 1989, for slaughter market in the 7 States preparing monthly estimates (AZ, CA, CO, IA, KS, NE, TX) totaled 6.43 million head, down 4 percent from a year ago and 6 percent below September 1, 1987.

Marketings of fed cattle during August totaled 1.68 million, down 5 percent from last year and 2 percent below two years ago.

Placements of cattle and calves on feed in the 7 States during August totaled 1.62 million, down 3 percent from last year and 16 percent below August 1987. Net placements of 1.54 million for August is 3 percent below last year and 17 percent below 1987.

Other disappearance totaled 76 thousand head compared to 66 thousand in August 1988 and 68 thousand in August 1987.

MONTANA EGG PRODUCTION DOWN 4 PERCENT

Montana poultry flocks produced 47 million eggs in the June-August quarter of 1989. This is down 4 percent from the same 3-month period in 1988.

There were 710,000 layers in the state during the third quarter of 1989, compared with 780,000 the previous year. Daily rate of lay per 100 laying hens was 71.3, up from 68.2 last year.

The Nation's laying flocks produced 16.7 billion eggs during the June through August quarter, down 2 percent from the corresponding quarter a year ago. Production included 14.5 billion for table eggs and 2.19 billion for hatching eggs. Layers for the quarter averaged 266 million, down 2 percent from the 271 million a year ago.

All layers in the U.S. on September 1, 1989 totaled 267 million, compared with 272 million a year ago. The 267 million layers consisted of 228 million layers producing table or commercial type eggs and 38.3 million layers producing hatching type eggs. Rate of lay per day on September 1, 1989 averaged 67.6 eggs per 100 layers compared with 68.1 for September 1, 1988 and 68.1 on August 1, 1989.

1988 PRODUCTION DOWN 8 PERCENT, VALUE UP 27 PERCENT

Production of potatoes across the U.S. in 1988 totaled 356 million cwt, down 8 percent from the previous year and 1 percent below 1986. The crop was harvested from 1.26 million acres, down 3 percent from 1987 but 3 percent above 1986. Drought in the North Central states dropped the national average yield to 283 cwt per acre compared with a record high 301 cwt in 1987 and 296 cwt in 1986.

Value of production was a record high $2.14 billion, up 27 percent from 1987 and 5 percent above the previous high in 1984. The average price was $6.02 per cwt compared with $4.38 in 1987 and $5.03 in 1986.

Sales covered 91.3 percent of the crop, or 326 million cwt. Farmers kept back 4.85 million cwt for seed and nearly a million cwt for home use and livestock feed. Shrinkage and loss was a minimal 25.1 million cwt, 21 percent below 1987 and the lowest since 1983.

Montana's potato production for 1988 was 2.2 million cwt of which 1.9 million was sold for a season average price of $7.75 per cwt. The 1988 price compares with $5.65 per cwt received last season. The majority of Montana's potatoes are sold for certified seed.

AUGUST MILK PRODUCTION

Milk production in the 21 major States during August totaled 10.1 billion pounds, 2 percent below production in these same States in August 1988. July revised production, at 10.3 billion pounds, was 2 percent below July 1988.

Production per cow in the 21 major States averaged 1,190 pounds for August, 6 pounds below August 1988.

The number of cows on farms in the 21 major States was 8.49 million head, 103 thousand head below August 1988 and 4 thousand head below July 1989.

During the April-June period the 21 major States produced 32.3 billion pounds of milk, 85.1 percent of the U.S. production. If producers in the remaining 29 States not surveyed monthly followed the same pattern as the 21 States, the U.S. production would be 11.9 billion pounds for August 1989.

FARMERS ARE OPTING FOR BIGGER TRACTORS

Look for U.S. farm machinery sales to increase for the 3rd straight year, reaching anywhere from $6.2-$6.7 billion this year. Spurring sales are higher net cash incomes, lower real interest rates, better farmland values, and lower farm debt. Many farmers held off buying new farm machinery in the early and mid-1980's, oftentimes purchasing used machinery. The result is an aging of farm machinery stock and that's fueled demand, too.

This year is shaping us as a good year for tractor sales, especially the more powerful units. Ag economists expect sales of 140+ horsepower 2-wheel drive tractors to be up 23% while 4-wheel drive tractors in that category will shoot up a whopping 65%.

This suggests that farmers find large-scale production more effective. Greater use of larger tractors represents an upgrading of equipment (it encourages use of larger tillage machinery and other equipment) and an increase in the scale of farm operations.

STUDY SAYS ALTERNATIVE AGRICULTURE CAN WORK

A committee of the National Research Council recently issued a report on "Alternative Agriculture." The committee did an extensive study of 11 U.S. farms that use organic farming methods rather than fertilizer and pesticides to maintain and increase productivity.

They say it's possible to have high productivity using alternative farming methods, but more know-how and management skills are required to make it work. Practices such as crop rotations, biological pest control, and new tillage methods need study to determine the best procedures.

The report criticized current farm programs for discouraging crop rotation practices by allowing a loss of program benefits when rotations are used. They also said it takes too long to register newer and safer pesticides, including genetically engineered products, to replace more hazardous materials.

WINTER WHEAT SEEDING AHEAD OF NORMAL

The weather has been excellent for harvesting and good progress was made last week. About 90 percent or more of the grain has been harvested. That's still behind normal, but most are thankful to finish up before more damage can be done.

Winter wheat seeding is going well--in fact, we're ahead of normal. Nearly half is planted compared with 46% normally seeded by now. The moisture situation is variable, but mostly adequate in the primary winter wheat areas. The eastern portions of the state are still short of moisture. Some rain fell early last week with over an inch in Polson, Helena, Butte, and Fort Benton.

Farmers have been busy trying to finish up on grain and hay harvest and they're about 2/3 done harvesting corn silage and dry beans. A few more days of good weather and all remaining crops except for sugar beets and potatoes will be safely in the bin.

STATE	85	29	89

SEPTEMBER 1 CROP PRODUCTION

Montana's 1989 wheat crop was forecast on September 1 to be 151.2 million bushels, unchanged from the August 1 forecast. Winter wheat production is expected to be 56.1 million bushels, hard spring wheat 88.4 million, and durum 6.7 million. The state's all wheat crop is 2.5 times greater than last year, and almost the same as the 1987 crop. Harvesting became difficult during late August because of rain and some sprout damage occurred to the spring wheat crop.

Barley, in Montana, is forecast to be 65.6 million bushels, also the same as the August estimate and 2.2 times more than last year. Considerable malting barley was damaged by the late August rains. Other crop estimates for Montana are: Oats, 6.5 million bushels, 2.3 times more than last year; all hay at 4.36 million tons, 1.5 times 1988; and sugarbeets at 1.1 million tons, up 6 percent.

For the nation, all wheat production is forecast at 2.06 billion bushels, up 1 percent from August 1 and 14 percent more than the 1988 production. Average yield is forecast at 32.9 bushels per acre, 1.2 bushels per acre less than last year. Harvested area is still expected to total 62.7 million acres, up 18 percent from 1988. Durum wheat production is now forecast at 93.6 million bushels, up 3 percent from last month and up 109 percent from the drought reduced crop of 1988. Other spring wheat production for 1989 is now forecast at 505 million bushels, 4 percent more than the August 1 forecast and 146 percent more than the 1988 production.

Barley production is forecast at 401 million bushels, up 2 percent from last month and 38 percent above 1988. The expected yield per acre is forecast at 46.9 bushels.

SEPTEMBER 1 PASTURE AND RANGE FEED CONDITION

Montana's pasture and range feed condition rating of 89 percent is 60 points higher than a year ago at this time. The high condition rating reflects good rainfall early in the season as well as August rains. Pastures and ranges have been providing ample feed in most locations during the 1989 grazing season, and prospects for fall and early winter grazing are very good.

AUGUST PRICES RECEIVED

Montana grain prices went down in August while livestock prices were mostly up. The all wheat price at $3.87 per bushel was down 13 cents from July, but was 1 cent above August 1988. Barley, at $2.00 per bushel, was down 15 cents from July and 76 cents under last year. Steers and heifers jumped $2.30 per cwt. to $71.50, calves were up $5.60 to $89.50, and cows rose $1.50 to $49.50. Hogs, at $37.50, were up 10 cents and lambs at $69.00, were up $3.50. The all hay price at $70.00 per ton was up $3.00.

The Montana all farm products prices received index for August at 172 is up 7 points from July but 7 points under last year. The all crops index at 156 was down 6 points from July and down 9 points from August 1988.

The August livestock and products index at 186 is 18 points above July but 4 points under last year.

Nationally, the August all farm products index of prices received decreased 2 points from July to 144 percent of its January-December 1977 average. Decreases in the prices of soybeans, corn, lettuce, and potatoes were partially offset by higher prices for cattle, apples, eggs, and grapefruit. The all farm products index was the same as last year. Compared with a year ago, oilseeds and feed grain prices showed the greatest decreases while meat animals and milk had the largest increases.

WHEAT AND BARLEY MOVEMENT

Montana wheat shipped to out-of-state destinations in December 1988-May 1989 at 40.4 million bushels was 48 percent below the same period last year. Shipments to eastern destinations totaled .3 million bushels, down 75 percent from last year. Movement to the west was down 48 percent at 39.5 million bushels. Other destinations, mostly south and southeast of Montana, received .5 million bushels, down 53 percent from last year. Rail movement amounted to 34.6 million bushels--86 percent of total shipments compared with 90 percent in the 1987-88 period.

Montana barley shipped to out-of-state destinations, December 1988-May 1989, was 17.2 million bushels, down 14 percent from the same period last year. Shipments to western destinations were down 37 percent and eastern destinations were up 55 percent. Barley hauled by rail was 90 percent of total movement, the same portion as in the 1987-88 period.

JULY RED MEAT PRODUCTION

Montana slaughter plants produced 1.1 million pounds of red meat in July 1989. This production is down 15 percent from last month, and down 12 percent from July 1988.

The number of cattle slaughtered, at 1,300 head is down 100 head from last year. Average liveweight of cattle slaughtered was 938 pounds, down 10 percent from last July. Hog slaughter, at 2,200 head is down 200 head from last year. Average liveweight of hogs slaughtered at 233 pounds, was down 3 percent from last year.

Commercial red meat production for the United States in July 1989 totaled 3.05 billion pounds, down 4 percent from July 1988. January-July red meat production, at 22.5 billion pounds was nearly the same as last year. The percentage changes from 1988 accumulated production by individual components were: beef, down 2; veal, down 8; pork, up 3; lamb and mutton, up 2. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

CATTLE ON FEED IN 7 STATES DOWN 4 PERCENT FROM LAST YEAR

Cattle and calves on feed August 1, 1989, for slaughter market in the 7 States preparing monthly estimates totaled 6.57 million head, down 4 percent from a year ago and 2 percent below August 1, 1987.

Marketings of fed cattle during July totaled 1.69 million, down 4 percent from last year and 1 percent below two years ago.

Placements of cattle and calves on feed in the 7 States during July totaled 1.31 million, up 5 percent from last year and 3 percent above July 1987. Net Placements of 1.25 million for July is 5 percent above last year and 4 percent above 1987.

Other disappearance totaled 63.0 thousand head compared to 62.0 thousand in July 1988 and 71.0 thousand in July 1987.

NUMBER OF WORKERS UP, WAGE RATES INCREASE

There were 3.80 million people working on the Nation's farms and ranches during the week of July 9 - 15, 1989. This number was up 8 percent from the 3.52 million workers during the comparable week in 1988. Self-employed farm operators accounted for 1.63 million of the total, along with 623,000 unpaid workers, and 1.20 million workers hired directly by farm operators. Agricultural service employees made up the remaining 351,000 workers.

Farm operators paid their hired workers an average rate of $5.23 per hour during the July 1989 survey week. This rate was up 33 cents from a year earlier. Workers paid on an hourly basis earned $5.08 per hour compared with $4.72 last July. Field workers received an average of $4.96 per hour, up 33 cents from the July 1988 week. Livestock workers earned $4.79 compared with $4.50 per hour a year earlier.

Self-employed farm operators worked an average of 41.7 hours, 2.7 hours less than the comparable week in 1988. Unpaid workers averaged 38.4 hours, 1.1 hours above last year. Hired employees worked 39.6 hours compared with 37.4 hours last July.

Benefits, such as housing and meals, were provided to 45 percent of the hired workers during the survey week. This compares with 44 percent during the July 1988 survey week. Data from the farm costs and returns survey showed that the value of benefits including insurance and retirement, FICA and other compensation, taxes, housing, and non-cash perquisites represented 17 percent of the total farm and ranch expenditures for farm labor in 1988. This percent compares with 15 percent in 1987.

JULY MILK PRODUCTION

Milk production in the 21 major states during July totaled 10.3 billion pounds, 2 percent below production in these same states in July 1988. June revised production, at 10.4 billion pounds, was 1 percent below June 1988.

Production per cow in the 21 major states averaged 1,213 pounds for July, 9 pounds below July 1988.

The number of cows on farms in the 21 major states was 8.50 million head, 104 thousand head below July 1988 and 4 thousand head below June 1989.

During the April-June period the 21 major states produced 32.3 billion pounds of milk, 85.1 percent of the U.S. production. If producers in the remaining 29 states not surveyed monthly followed the same pattern as the 21 states, the U.S. production would be 12.1 billion pounds for July 1989.

JULY EGG PRODUCTION AND LAYER NUMBERS DOWN 2 PERCENT

U.S. egg production totaled 5.63 billion during July 1989, down 2 percent from the 5.72 billion produced a year ago. Production included 4.89 billion for table eggs and 738 million for hatching eggs. The total number of layers during July averaged 265 million, down 2 percent from the 270 million a year ago. July egg production per 100 layers was 2,123 eggs, compared with 2,120 in July 1988.

All layers in the U.S. on August 1, 1989 totaled 264 million, compared with 270 million a year ago. The 264 million layers consisted of 226 million for table or commercial type eggs and 37.9 million for hatching type eggs. Rate of lay per day on August 1, 1989 averaged 68.1 eggs per 100 layers, down fractionally from a year ago, and from the 68.7 on July 1, 1989.

Laying flocks in the 20 major egg production States produced 4.65 billion eggs during July, down 2 percent from the 4.75 billion produced a year ago. The number of layers during July averaged 220 million, down 2 percent from the 225 million a year ago.

Data for the 30 quarterly States were estimated based on the percent change in the 20 States making monthly surveys. These monthly States accounted for about 83 percent of the U.S. egg production and layer numbers during the 3-month period, March 1989 through May 1989.

JUNE U.S. MANUFACTURED DAIRY

U. S. dairy plants produced 50.6 million pounds of creamed cottage cheese in June, down 1 percent from last month and down 11 percent from June 1988. Lowfat cottage cheese output, at 26.4 million pounds, was 3 percent below last month, but 2 percent above last year.

June ice cream production was 83.5 million gallons, down 7 percent from last year. Sherbet production at 5.59 million gallons, was down 2 percent from a year ago.

AUGUST 1 CROP PRODUCTION FORECAST

Montana's wheat crop was forecast on August 1 to be 151.2 million bushels, down 5 percent from the July 1 estimate. Heat and scanty rainfall, especially in the eastern part of the state, reduced hard spring wheat to 88.4 million bushels, down 7 percent from July, while durum at 6.7 million is down 20 percent. Winter wheat, however, remains unchanged at 56.1 million bushels. The state's all wheat crop is 2.5 times greater than last year. Yield prospects on August 1 were 33 bushels per acre for winter wheat, 26 bushels for hard spring wheat and 20 bushels for durum.

Barley is forecast to be 65.6 million bushels, down 9 percent from the July 1 forecast. Barley yield is estimated to be 41 bushels per acre. Oats production is forecast at 6.5 million bushels, down 10 percent. Hay production in Montana, at 4.36 million tons is over 1.5 times larger than last year and the highest production since 1982. Alfalfa is forecast at 2.86 million tons, while other hay is estimated to be 1.5 million tons.

Nationally, all wheat production is forecast at 2.04 billion bushels, up 13 percent from 1988, but 3 percent below July 1. Average yield at 32.6 bushels per acre is 0.8 bushel less than July 1 and 1.5 bushels below last year. Barley production is forecast at 392 million bushels, down 12 percent from last month, but 35 percent above the drought reduced crop of 1988. The expected yield per acre is forecast at 45.8 bushels compared with last season's average of 38.6 bushels. All hay production for 1989 is forecast at 145 million tons, an increase of 14 percent from last year's drought reduced output. Higher yields are only partially offset by lower acreage.

PRICES RECEIVED BY FARMERS SLIGHTLY LOWER

Montana crop prices dipped during July while livestock prices mostly went up. Harvest pressure lowered the all wheat price to $3.89 per bushel, 21 cents under June, but 21 cents above a year ago in July. Hay prices sagged $18.00 during July to $67.00 per ton. Barley prices decreased only 6 cents to $2.35 per bushel. Steers and heifers were off $1.60 per cwt to $69.70, but cows went up $1.60 to $48.00. Calves went up $1.10 to $88.80. Hogs gained 90 cents to $37.70 per cwt.

The all farm products index of prices received by Montana farmers for July at 165 (1977=100) is 5 points under June but 2 points above a year ago. The all crops index at 160 is 10 points under June, but is 4 points above July 1988.

The livestock and products index at 170 is unchanged from June and 1 point above a year ago.

Nationally, the all farm products index of prices received by farmers for July decreased 1 point from the previous month to 146 percent of its 1977 average. Compared with a year earlier, the index was up 4 points. The July all crops index was 134, down 2.9 percent from last month and 2.2 percent from last year. The July livestock and poultry index, at 156, was down 0.6 percent from June, but 6.1 percent above July a year ago.

2/ April 1988 prices paid index.
3/ April 1989 prices paid index.

FARM NUMBERS SHOW UPWARD TREND

The number of farms in Montana, at 24,700, continues the trend--started in 1975--of slightly increased numbers. Revision to numbers from 1983-1988 were necessary after the 1987 Census of Agriculture showed an increase in farm numbers. Two major factors that contributed to increased farm numbers are: 1) small units created by splitting up large operations as more part-time operators get into farming and ranching and 2) restructuring to meet eligibility requirements of the farm program.

There are 60.6 million acres in farms and ranches in Montana in 1989, down from 60.7 in 1988. The average size of operation, at 2,453 acres, declined slightly from 2,467 acres in 1988.

	MONTANA			UNITED STATES		
Year	Number of Farms	All Land in Farms	Average size of Farms	Number of Farms	All Land in Farms	Average size of Farms
	Thousands	Million Acres	Acres	Thousands	Million Acres	Acres

U.S. CATTLE NUMBERS UNCHANGED

All **cattle and calves** in the United States as of July 1, 1989, totaled 108.6 million head, virtually unchanged from July 1, 1988, but 1 percent below the 109.5 million two years ago. This stops the seven year trend of a declining cattle inventory.

All **cows and heifers** that have calved, at 44.3 million, were unchanged from a year ago but down fractionally from 44.4 million two years ago.

-- Beef cows, at 34.2 million, were up slightly from July 1, 1988 and 1 percent above July 1, 1987.

-- Milk cows, at 10.1 million, were 1 percent below July 1, 1988, and 3 percent below two years ago.

The 1989 calf crop is expected to be 40.7 million, down fractionally from 1988 but up 2 percent from 1987. Calves born during the first half of the year are estimated at 29.3 million, down slightly from a year ago but up 2 percent from 1987.

CATTLE & CALVES: Number by Class & Calf Crop, United States, July 1, 1987-89

Class	1987	1988	1989	1989 as % 1988
		1,000 Head		Percent
Cattle and calves	109,500	108,500	108,600	100
Cows and heifers that have calved:	44,400	44,300	44,300	100
Beef cows	34,000	34,050	34,200	100
Milk cows	10,400	10,250	10,100	99
Heifers 500 pounds and over	17,000	16,500	16,700	101
For beef cow replacement	4,800	4,800	5,000	104
For milk cow replacement	4,600	4,400	4,500	102
Other heifers	7,600	7,300	7,200	99
Steers 500 pounds and over	14,800	14,500	14,500	100
Bulls 500 pounds and over	2,200	2,200	2,200	100
Calves under 500 pounds	31,100	31,000	30,900	100
Calf crop 1/	40,086	40,872	40,700	100

1/ for the current year, the calf crop is the number of calves born before July 1 plus the number expected to be born on and after July 1.

CATTLE ON FEED DOWN 6 PERCENT IN 13 QUARTERLY STATES

Cattle and calves on feed July 1, 1989, for slaughter market in the 13 quarterly States totaled 8.46 million head, down 6 percent from July 1, 1988, and down 2 percent from 1987.

The cattle on feed inventory included 5.31 million steers and steer calves, 8 percent below last year and 5 percent below 1987. This group represented 63 percent of the total July number on feed, compared to 64 percent last year and 65 percent in 1987. Heifers and heifer calves accounted for 3.10 million, 3 percent below a year ago but up 2 percent from 1987.

Placements of cattle and calves on feed during the April-June 1989 quarter totaled 5.18 million, down 12 percent from the comparable period in both 1988 and 1987. This is the smallest second quarter placements since 1975. Other disappearance of 415 thousand head leaves net placements at 4.76 million, compared with 5.48 In 1988.

Marketings of fed cattle for slaughter during April-June totaled 5.99 million, 2 percent above 1988 and 7 percent above the same period in 1987. Cattle feeders expect to market 6.04 million head during the July-September quarter of 1989. This would be down 2 percent from the third quarter marketings in 1988 and fractionally above 1987.

CROP CONDITIONS IMPROVE

Most of Montana received some rain again last week and as a result, crop conditions improved. Showers throughout the week helped push crop prospects higher. Winter wheat was rated 74% good to excellent while spring wheat, oats, and barley were 2/3 to 3/4 good to excellent.

Grain crops are rapidly turning color indicating a change from active growth to ripening and maturity. Farmers will soon start harvesting winter wheat. About 11% of the winter wheat is ripe while about 2/3 is turning color. Last year, nearly 60% of the winter wheat was already harvested. The spring planted grains are still mostly green, but about 1/4 are turning color. Due to the cool, wet spring, crops are about two weeks behind normal in maturity.

About 90% of the first cutting alfalfa hay has been harvested. Haying is running behind normal along with the growth and harvest of grain crops.

Livestock are doing well and pastures are mostly in good shape. We're thankful for the good weather and sufficient moisture so far this year, and we're optimistic about yield prospects. The forecast calls for above normal temperatures through July with normal to below normal precipitation. The next crop production report will be released on August 10.

MINK PELT PRODUCTION UP 8 PERCENT

Mink pelt production in the **United States** in 1988 totaled 4.45 million pelts, up 8 percent from 1987. Wisconsin, the major mink producing State, produced 1.12 million pelts. Estimates for Montana are not published separately.

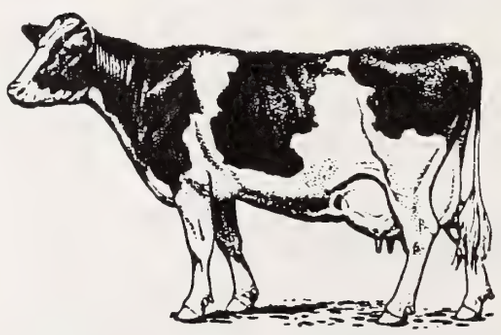
By color class, the number of pelts as a percent of the total U.S. production was: Standard - 43.8 percent; Demi-buff -11.7 percent; Mahogany - 11.6 percent; Ranch Wild - 11.0 percent; Gunmetal - 6.7 percent; Pastel - 4.2 percent and White - 2.2 percent. The remaining color classes accounted for 8.8 percent.

Mink pelts sold during the 1988 crop year were valued at $143.8 million dollars, down 19 percent from the $177.2 million a year ago. The average price per pelt for the 1988 crop year was $32.30, compared with $43.00 in 1987 and $41.30 in 1986.

Female mink bred to produce kits in 1989 totaled 1.12 million, up fractionally from 1988. Females bred for the three major color classes are: Standard - 585 thousand; Ranch Wild - 132 and Demi-Buff - 113 thousand. Females bred in the leading States are: Wisconsin - 304 thousand; Utah - 225 thousand and Minnesota - 132 thousand.

Percent of total females bred to produce kits in 1989 by color class are: Standard - 48.7 percent; Ranch Wild - 11.0 percent; Demi-Buff - 9.4 percent; Mahogany - 8.2 percent; Gunmetal - 7.4 percent; Pastel 3.5 percent; and Violet-Type 3.1 percent. The remaining color classes accounted for 8.7 percent.

There were 1,027 mink farms producing pelts in 1988 unchanged from a year ago. Leading States were Wisconsin with 209 farms, Utah with 175 farms and Minnesota with 142.



NATION'S JUNE EGG PRODUCTION AND LAYER NUMBERS DOWN 2 PERCENT

U.S. egg production totaled 5.48 billion during June 1989, down 2 percent from the 5.57 billion produced a year ago. Production included 4.76 billion for table eggs and 723 million for hatching eggs. The total number of layers during June averaged 266 million, down 2 percent from the 271 million a year ago. June egg production per 100 layers was 2,060 eggs, compared with 2,053 in June 1988.

All layers in the U.S. on July 1, 1989 totaled 266 million, compared with 269 million a year ago. The 266 million layers consisted of 227 million for table or commercial type eggs and 38.3 million for hatching type eggs. Rate of lay per day on July 1, 1989 averaged 68.7 eggs per 100 layers, compared with 68.3 for July 1, 1988, and 68.6 on June 1, 1989.

Laying flocks in the 20 major egg production States produced 4.53 billion eggs during June, down 2 percent from the 4.63 billion produced a year ago. The number of layers during June averaged 221 million, down 2 percent from the 226 million a year ago.

Data for the 30 quarterly States were estimated based on the percent change in the 20 states making monthly surveys. These monthly states accounted for about 83 percent of the U.S. egg production and layer numbers during the 3-month period, March through May 1989.

QUARTERLY MILK PRODUCTION

Montana's milk production during the April-June quarter of 1989 was 88 million pounds, down 2 percent from the same period last year, but up 5 percent from the first quarter of 1989. Milk cow numbers held steady with 25,000 head.

Grain and other concentrates fed daily per cow averaged 14.5 pounds compared with 15.5 pounds on July 1, 1988. The average value per 100 pounds of concentrate ration fed to milk cows was $7.40 on July 1, 1989, compared with $6.90 last July.

The quarterly production of milk for the **U.S.** was 38.0 billion pounds, up slightly from April-June 1988.

The average number of cows in the U.S. during the April-June quarter was 10.1 million head, 1 percent below April -June 1988 and was down slightly from January-March 1989.

Grain and other concentrates fed to milk cows on July 1, 1989 averaged 17.1 pounds, 0.3 pounds more than on July 1, 1988.

Value of grain and other concentrates fed to cows on July 1, 1989 averaged $8.22 per hundredweight, $0.24 per hundredweight more than July 1, 1988.

NATIONAL SMALL GRAIN SUMMARY FOR THE WEEK OF JULY 17-23, 1989

Winter wheat harvest was 80% complete, 3 points behind normal. Harvest advanced 40 points in Ohio, 29 points in Colorado, 21 points in Indiana, and 20 points in Nebraska. In Kansas, harvest reached 99% complete. Early harvest activities continued in Oregon, Idaho, and Washington. Montana's winter wheat harvest had not begun.

Spring wheat condition was mostly fair. Dry conditions in North Dakota further stressed spring wheat fields. Harvest had begun in three of the five major producing States, as 2% of the crop has been harvested which is 4 points behind normal.

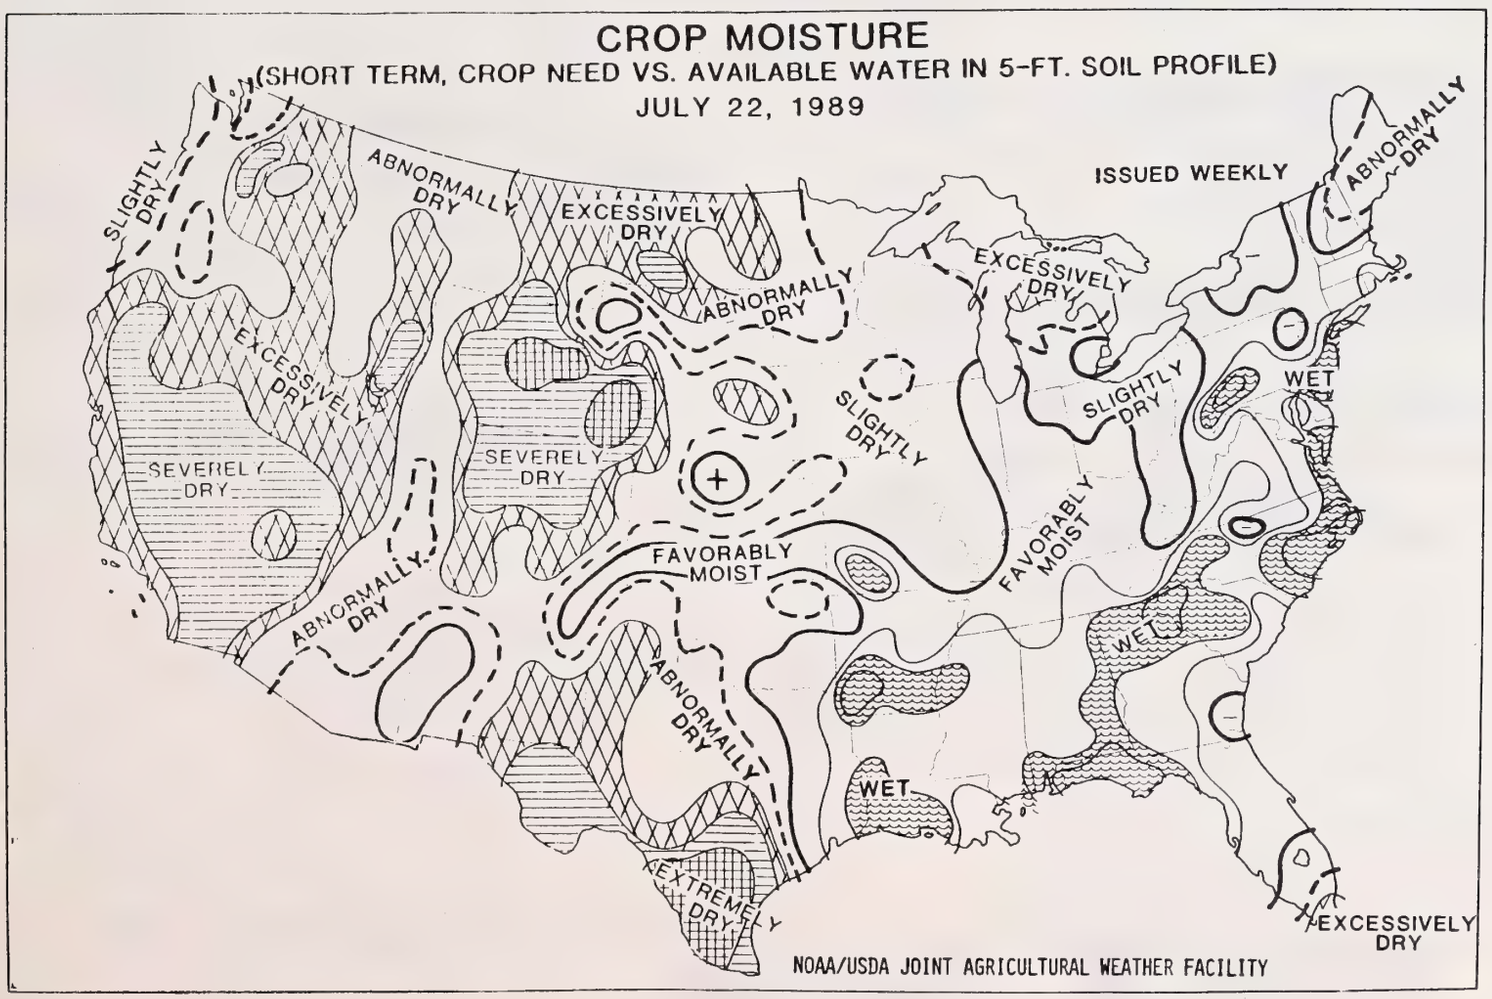
SOURCE: WEEKLY WEATHER & CROP BULLETIN.

JUNE RED MEAT PRODUCTION

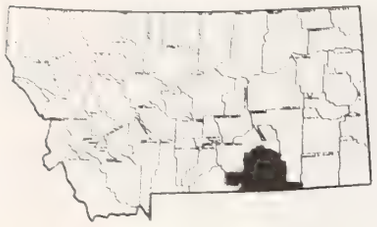
Montana slaughter plants produced 1.28 million pounds of red meat in June 1989. This production is up 15 percent from last month, but down 11 percent from June 1988. The number of cattle slaughtered, at 1,600 head, was down 100 head from last year.

The average liveweight of cattle slaughtered was 1,075 pounds, unchanged from last year. June hog slaughter at 2,200 head, unchanged from a year ago. Average liveweight of hogs slaughtered, at 233 pounds, was down 2 percent from last year.

Commercial red meat production for the **United States** in June 1989 totaled 3.34 billion pounds, up 1 percent from June 1988. January-June red meat production, at 19.5 billion pounds was up 1 percent from last year. The percentage changes from 1988 accumulated production by individual components were: Beef, down 2; Veal, down 7; Pork, up 4; Lamb and Mutton, up 2. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.



*featuring . . .*BIG HORN COUNTY



Big Horn County was created in January 1913 and occupies approximately 3,188,812 acres of land along the Montana/Wyoming border in south central Montana. The Crow Indian Reservation is almost entirely contained within the boundaries of Big Horn County, as well as half of the Northern Cheyenne Indian Reservation. Big Horn Lake makes up a section of the western border of the county, and the Big Horn River flows from the north end of the lake at the Yellowtail Dam. The river continues north, is joined by the Little Big Horn River in north central Big Horn County, and eventually empties into the Yellowstone River just outside the county's northern boundary. The Rosebud Mountain range occupies a portion of the eastern half of the county, while the Big Horn Mountains lie in the southwestern corner.

Big Horn County was the second largest cattle raising county in the state in 1987. It came in 25th for hog numbers in 1986 and 25th in the sheep inventory on January 1, 1987.

Major crops grown in the area include hay, winter wheat, and barley. The county ranked 9th, 8th, and 21st, respectively, for these crops in the 1987 crop production rankings. Big Horn County also came in 24th for spring wheat, and 35th for oats.

The large number of cattle raised, along with the other livestock and livestock products, returned $36,405,000 to the county in 1987. Crop production contributed $19,231,000 and government payments added $5,218,000. This made for a total of $60,854,000 in all cash receipts for Big Horn County in 1987.

RELEASED: JULY 13. 1989

HIGHLIGHTS:

Pasture & Range
Manufactured Dairy
Hog & Pig Inventory
Crop Production
Small Grains
Ag Prices Received
Grain Stocks

MONTANA HIGHLIGHTS

- Montana's all wheat at 159.7 million is 166% more than last year and the fourth highest production on record.

- The forecasted wheat production, if realized, will put Montana at number three for the Nation, behind Kansas and North Dakota.

- Montana lost 800,000 acres of winter wheat to winterkill but gained 1,500,000 more acres of spring wheat than a year ago. Total wheat acres for harvest are 42% more than a year ago.

- Barley production at 72 million bushels is up 140% from last year but 24% under the record set in 1987.

- Total expected harvested acres of small grains at 7.2 million is 39 percent more than last year.

- Acres of hay for harvest, at 2.3 million, are up 28 percent from 1988. Expected alfalfa hay for harvest is up 18 percent. First forecast of production will be made August 10th.

MAY MANUFACTURED DAIRY

Montana dairy plants produced 112,000 gallons of ice cream in May, up 9 percent from April but down 14 percent from May 1988. Creamed cottage cheese output, at 428,000 pounds, was up 81 percent from last month, and up 50 percent from last year. There were 67,000 pounds of lowfat cottage cheese produced, down 64 percent from last month, and down 69 percent from last year.

U.S. HOG & PIG INVENTORY

U.S. inventory of all hogs and pigs on June 1, 1989 was estimated at 55.5 million head. This was 1 percent below a year ago but 6 percent above June 1, 1987.

- Breeding inventory, at 7.33 million head, was 3 percent below last year but 4 percent above two years ago.

- Market hog inventory, at 48.2 million head, was 1 percent below a year ago but 7 percent above two years ago.

U.S. hog producers intend to farrow 6.03 million sows during the June-November period, a slight increase from the actual sows farrowed during 1988 and 4 percent above two years ago.

PASTURE & RANGE FEED CONDITION IS RATED EXCELLENT

Montana's pasture and range feed condition is rated excellent. Moisture during the spring and early summer months was generally adequate, but cool temperatures held back growth early in the season. Overgrazing during last summer's drought created a weed problem on some ranges, but grazing should provide adequate feed for this season.

JUNE PRICES RECEIVED DOWN 7 POINTS

The June 1989 index of prices received by **Montana** farmers and ranchers declined 7 points from May. The index is still 20 points above last year.

The all crops index and livestock index were both down 7 points from the previous month. Compared with last year, the crops index was still 34 points higher and the livestock index was up 8 points. All crop items and all livestock items except steers, heifers, and hogs were down from last month.

Barley at $2.50 per bu. dropped 22 cents from the May average. Oats, at $2.00, were off 23 cents; spring wheat (other than durum) fell 15 cents; durum dropped 44 cents, winter wheat was down 4 cents. Alfalfa hay was down $17.00 at $86.00 per ton.

In the livestock items, steers and heifers were up 80 cents per cwt. from May, at $73.90 for June and hogs moved up $5.30 to $40.90 per cwt. Cows declined 40 cents, averaging $45.60 per cwt. Calves fell off 80 cents to $85.50. Lambs at $61.50 for June were down $3.60 per cwt. Sheep were off 20 cents per cwt. Milk was down 13 cents per cwt. Eggs and wool were unchanged.

Nationally, the June all farm products index of prices received by farmers decreased 3 points from May to 146 percent of its January-December 1977 average. Decreases in the prices of tomatoes, cattle, wheat, and corn were partially offset by higher prices for lettuce, hogs, lemons, and strawberries. The index was 7 points above a year ago.

The June hog price was at the highest level since August last year. Most of the increase over last month was caused by strong barrow and gilt prices. Cattle and calf prices were mixed. All feed grain and oil seed prices decreased from May. Wheat prices were down while the rice price increased slightly. Lower broiler prices more than offset slight increases for eggs and turkeys.

CATTLE ON FEED IN 7 STATES DOWN 3 PERCENT

Cattle and calves on feed June 1, 1989, for slaughter market in the 7 States preparing monthly estimates totaled 7.56 million head, down 3 percent from a year ago and slightly lower than June 1, 1987.

Marketings of fed cattle during May totaled 1.75 million, up 1 percent from last year and up 15 percent from two years ago. This is the largest number of May marketings since 1972.

Placements of cattle and calves on feed in the 7 States during May totaled 1.62 million, down 25 percent from last year and down 18 percent from May 1987. This is the lowest May placement total since 1981. Net placements of 1.46 million for May is 28 percent below last year and 21 percent below 1987.

Other disappearance totaled 164 thousand head compared with 141 thousand in May 1988 and 143 thousand in May 1987.

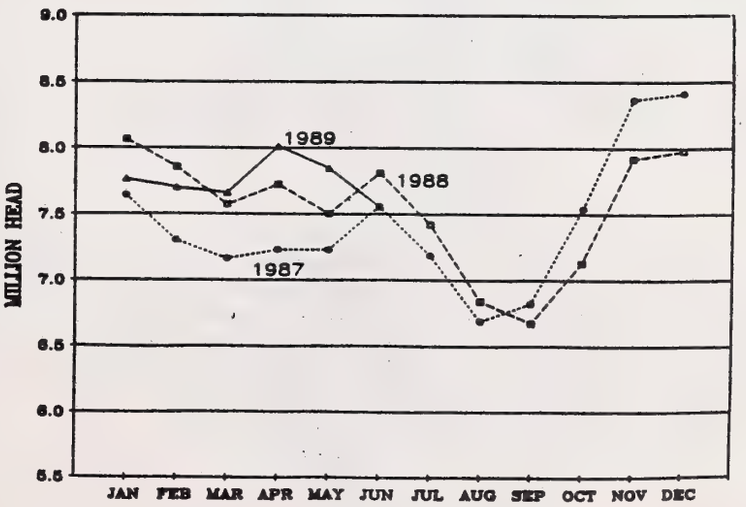
MAY RED MEAT PRODUCTION

Montana slaughter plants produced 1.11 million pounds of red meat during May 1989. This production is up 1 percent from last month, but down 15 percent from May 1988. The number of cattle slaughtered, at 1,300 head, was down 200 head from last year. The average liveweight of cattle slaughtered was 1,059 pounds, up 4 percent from last year. May hog slaughter at 2,400 head, was up 100 head from a year ago. Average liveweight of hogs slaughtered, at 237 pounds, was down 1 percent from last year.

Commercial red meat production for the **United States** in May 1989 totaled 3.40 billion pounds, up 6 percent from May 1988. January-May red meat production, at 16.1 billion pounds was up 1 percent from the same period last year. The percentage changes from 1988 accumulated production by individual components were: beef, down 2; veal, down 5; pork, up 4; lamb and mutton, up 2.

Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

CATTLE ON FEED
7 STATES



PLEASE RETURN

MAY MILK PRODUCTION

Milk production in the 21 selected States totaled 11.1 billion pounds, virtually unchanged from production in these same states for May 1988.

Production per cow in the 21 states averaged 1,304 pounds, 22 pounds more than May 1988.

The number of cows on farms in the 21 States was 8.52 million head, 19 thousand less than April 1989 and 115 thousand less than May 1988.

During the January-March period the 21 selected States produced 85.1 percent of the U.S. production. If the producers in the remaining 29 States not surveyed on June 1 followed the same pattern as the 21 States, the U.S. production would be 13.0 billion pounds for May 1989.

QUARTERLY EGG PRODUCTION

There were 46.0 million eggs produced in **Montana** during the March through May production period. This compares with 53.0 million eggs produced during the same quarter last year. The average number of layers on hand during the March-May quarter was 710,000 layers, down from 800,000 in 1988. The average rate of lay per 100 layers was 64.8 eggs, down from 66.3 during the March-May quarter in 1988.

The **Nation's** laying flocks produced 17.0 billion eggs during the March through May quarter, down 3 percent from the corresponding quarter a year ago. Production included 14.8 billion for table eggs and 2.21 billion for hatching eggs. Layers for the quarter averaged 268 million, down 3 percent from the 277 million a year ago.

All layers in the U.S. on June 1, 1989 totaled 266 million, compared with 273 million a year ago. The 266 million layers consisted of 227 million table or commercial type eggs and 39.0 million hatching type eggs. Rate of lay per day on June 1, 1989 averaged 68.6 eggs per 100 layers compared with 68.5 for June 1, 1988 and 68.6 on May 1, 1989.

Laying flocks in the 20 major egg production states produced 4.70 billion eggs during May, down 3 percent from the 4.85 billion produced a year ago. The number of layers during May averaged 221 million, down 3 percent from a year ago.

1988 YEARBOOK OF AGRICULTURE

The USDA publishes a yearbook of agriculture that addresses different ag issues each year. The 1988 yearbook is titled "Marketing U.S. Agriculture." It covers the marketing system for agricultural products. It covers specific marketing strategies where readers can shop for ideas to solve their own problems.

The book has a section where marketers tell their own success stories focusing on four key aspects of the marketing process:

-- Discovering what buyers want
-- Developing new and better products to meet consumer demand
-- Delivering quality goods
-- Promoting agricultural products

The book emphasizes that the food production processing and retailing chain is undergoing rapid change. Consumers are demanding more fast preparation products containing less fat, salt, and cholesterol. The pressure is also on to produce higher quality, safe foods.

The book provides a current look at where we are and some insight on future trends. You may order the book from the U.S. Government Printing Office or write to your Congressman--he has a number of complimentary copies available.

MEDICAL CARE COSTS EXPECTED TO EXCEED FOOD COSTS IN 1989

We often hear complaints from consumers about the cost of food. Here's some information that's downright shocking. This year we'll likely see consumer expenditures on medical care exceed the amount spent on food.

According to government figures, U.S. consumers spent $404 billion on medical care and $410 billion on food in 1988. Medical care costs have been racing upward--faster than any other major commodity. Back in 1965, medical care took only 5.3% of disposable income. In 1988, the average family spent 11.6 percent--more than a 100% increase!

How about food? In 1965, consumers spent 15.3 percent of their income on food compared with 11.8 percent last year--that's down 23 percent. So, food costs have been dropping over the years as a percent of your paycheck while medical costs have taken a much bigger bite.

We always think about the costs of cars and trucks as being very expensive but they now take 6 percent of income while they took 6.1 percent back in 1965. That makes the medical costs even more shocking.

RECORD GRAIN SALES TO USSR

Sales of U.S. grain to the Soviet Union this fiscal year (1989) are already at a record high level in volume and the year doesn't end until September 30. The total as of early May was about 20 million tons. The Fiscal 1988 total was 14.4 million tons and the previous record 18.6 million tons.

The value of the grain, as of early May, was already 60 percent higher than the total for the previous year and was approximately equal to the record of $2.3 billion set in 1985.

JUNE 1989 WORLD WHEAT SITUATION

A small decrease in the world wheat production forecast portends continued tightness in the 1989/90 world wheat situation. During the past month, there has been continued concern about 1989/90 world wheat supplies as U.S. and European crop prospects dimmed slightly.

With world wheat utilization projected to continue strong and projected world wheat ending stocks at their lowest level in more than a decade, wheat prices will be particularly sensitive to growing conditions and import demand.

The combination of a year-to-year improvement in crops in some of the major importing countries and continued strong wheat prices are expected to reduce world wheat import demand in 1989/90 from the level of a year earlier. The major change will be in the USSR where wheat imports are expected to decline by around 20 percent to 12 million tons.

World wheat utilization in 1989/90 is expected to exceed production for the third year in a row although not as dramatically as in 1987/88 or 1988/89. World wheat stocks, currently projected to decline to around 109 million tons by the end of the 1989/90 marketing year, would be at their lowest level since 1977/78. The United States, normally the world's largest holder of wheat stockpiles, will hold only around 13 percent of 1989/90's ending world wheat stocks.

FRENCH FRY SALES RISE

One of the big success stories in ag exports has been the phenomenal growth of U.S. frozen potato sales. Overseas sales of the popular french fry have more than doubled since 1980. But it doesn't end there. Exports of other frozen potato products have performed even better--rising 140% through the end of 1988.

Exports of fries in 1988 ran almost 20% above the trend set in the past 10 years. The key year was 1986, when exports rose 35% from the previous year.

Several factors account for the increase:

1. A decline in the real trade-weighted dollar exchange rate began in mid-1985, making potatoes (and other products) more affordable;

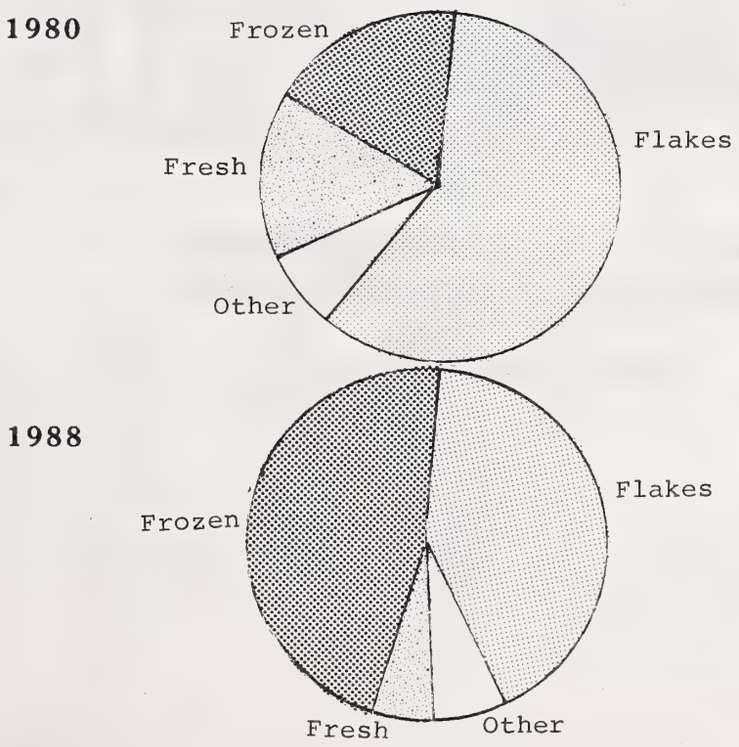
2. Diets have changed and incomes have risen in Asian countries, boosting demand for convenience foods, especially in Japan.

3. Japan imports an increasingly larger amount of frozen potato products since the varieties needed to make quality fries don't grow easily in their climate.

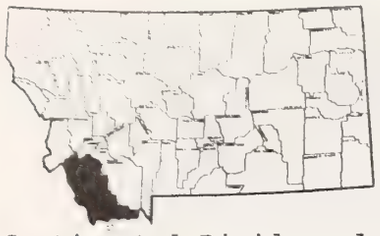
4. USDA's Targeted Export Assistance (TEA) program has been helpful in the Japanese market and potato promotion has continued.

5. The potato industry itself has worked hard to promote both quality production and sales.

U.S. POTATO EXPORTS BY PRODUCT



featuring . . . BEAVERHEAD COUNTY



Located in the extreme southwestern corner of Montana, Beaverhead County abounds in spots of historical interest. Lewis & Clark traversed the county and named it after Beaverhead Rock. The ghost town of Bannack was the scene of the state's first great gold discoveries and was Montana's first territorial capital. The Big Hole Battlefield National Monument, commemorating the Battle of the Big Hole, is located in the northwestern corner of the county near Wisdom. The county is bordered on three sides by the Continental Divide and is made up of several broad, rich valleys. The greater portion of the Beaverhead National forest lies within its boundaries and is a popular hunting and fishing area. The county was created in February of 1865 and the county seat is Dillon. This area has an annual average precipitation of 9.53 inches and an average of 99 frost-free days.

Cattle, sheep, and hay are the county's main agricultural products. It ranked first in cattle numbers and fifth in sheep numbers in the January 1, 1987 inventory. The county also ranked first in all hay production for the 1987 crop year. Other crops and their respective ranks in 1987 include barley (28th) and all wheat (37th).

The large numbers of livestock in the county brought in $40,631,000 in cash receipts for 1987. Crop cash receipts totaled $7,608,000, while government payments added $5,741,000. This brings the total 1987 cash receipts from agricultural sales and government payments to $53,980,000.

1988 CROP COUNTY ESTIMATES

County data for **all wheat** and **barley** were included in recent issues of this publication. Additional data for these crops, wheat by class and cropping practices for both, are now available from this office upon request. Corn county estimate data may also be requested.

These estimates are the only county figures published for Montana. They are based on our acreage and production survey conducted last fall. Nearly 7,700 questionnaires were summarized including 4,300 completed by telephone to ensure better coverage in each county. Thanks to those who provided information!

JUNE 1 CROP PRODUCTION

Montana's winter wheat crop is forecast at 40.5 million bushels, only slightly above last year's drought reduced crop. Yield is expected to be 27 bushels per acre based on June 1 conditions, up 7 bushels from the May 1 forecast. Acres for harvest at 1.5 million is estimated on the basis of a May 1 survey. A major acreage survey conducted during the first two weeks in June will provide a new reading on acres remaining for harvest.

For the **Nation**, winter wheat production is forecast at 1.41 billion bushels, down 2 percent from last month and 10 percent from 1988. Yields now expected to average 34.5 bushels per acre--down .4 bushels from last month. Yield and production are at the lowest level since 1978.

APRIL MANUFACTURED DAIRY DOWN

Montana dairy plants produced 103,000 gallons of ice cream in April, down 31 percent from March and down 33 percent from April 1988. Creamed cottage cheese output, at 236,000 pounds, was down 6 percent from last month and down 17 percent from last year. There were 184,000 pounds of lowfat cottage cheese produced, down 12 percent from last month, and down 5 percent from last year.

Creamed cottage cheese production in the **U.S.** was 48.6 million pounds, 11 percent below April 1988 and 7 percent below March 1989. Lowfat cottage cheese production was 25.6 million pounds, 7 percent above April 1988 but 5 percent below March 1989.

March ice cream production was 68.8 million gallons, down 4 percent from last year. There were 4.30 million gallons of sherbet produced, down 3 percent from April 1988. Butter production was 125 million pounds, 10 percent above April 1988 but 8 percent below March 1989.

PASTURE & RANGE CONDITION GOOD TO EXCELLENT

Montana's pastures and ranges have responded to ample spring moisture and are in good to excellent condition. Growth has been slow due to cool weather, and little or no forage from last year is present.

The condition rating on June 1 at 87 percent of normal compares with 73 percent on May 1, 1989 and 58 percent last year on June 1. Southwest Montana ranges have suffered from lack of ample moisture during much of the spring.

Nationally, pasture and range condition on June 1 was 74 percent of normal, 6 percent higher than both last year and last month, but 9 points below the 1978-1987 average.

MONTANA FARM PRICES HIGHER

Most **Montana** farm crop prices during May were higher than in April and continued a steady rise that began a year ago. Wheat and hay, by far Montana's most valuable crops, have had above average prices since last summer. However, livestock prices have generally softened since a year ago but are mostly still above years prior to 1988.

All wheat in May at $4.20/bu. compares with $4.13/bu. last month, and $2.95/bu. last May. Hay, at $103/ton is down $2.00/ton from April's prices, but is $61.00/ton above May 1988 prices. All beef cattle at $60.50/cwt compares with $62.60 a month ago and $61.30 a year ago. Hogs, at $32.20, are up from $31.40 last month but down from $40.40 last year. Sheep were $22.00/cwt. in May, $22.60 in April and $25.00 in May 1988.

The May prices received index for all farm products at 178 (1977=100) compares with 180 in April and 151 in May 1988. The crops index at 180 is up 2 points from April and is 61 points above last year. The livestock and products index at 177 is down 4 points from April and down 2 points from last year.

Nationally, the May all farm products index of prices received by farmers increased 4 points from April to 151 percent of its January- December 1977 average. Increases in the prices of hogs, oranges, potatoes, broilers, and tomatoes were partially offset by lower prices for sweet corn, eggs, lettuce, and soybeans. The index was 17 points above 1988. Broilers, potato and tomato prices were at record levels in May. Hogs increased sharply from last month.

May cattle prices continued close to April levels. Wheat and corn prices were up slightly while soybeans were down from a month earlier.

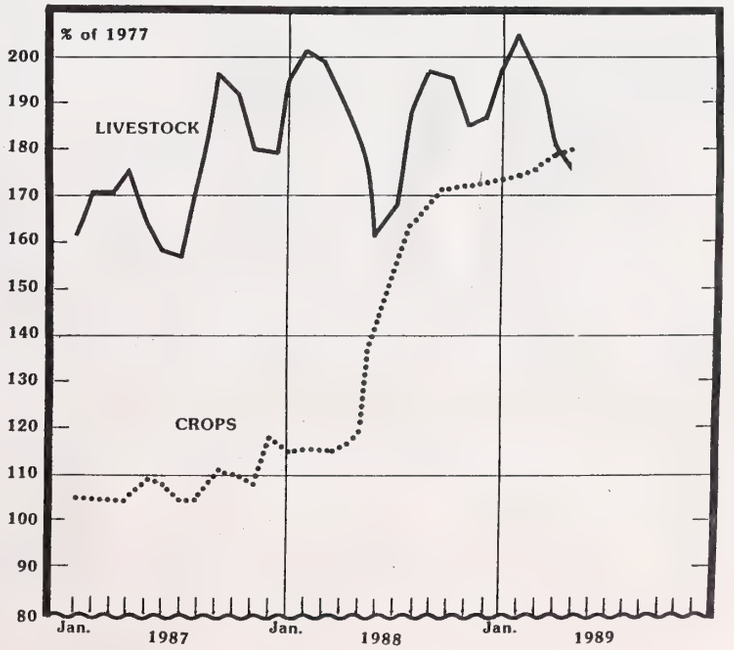
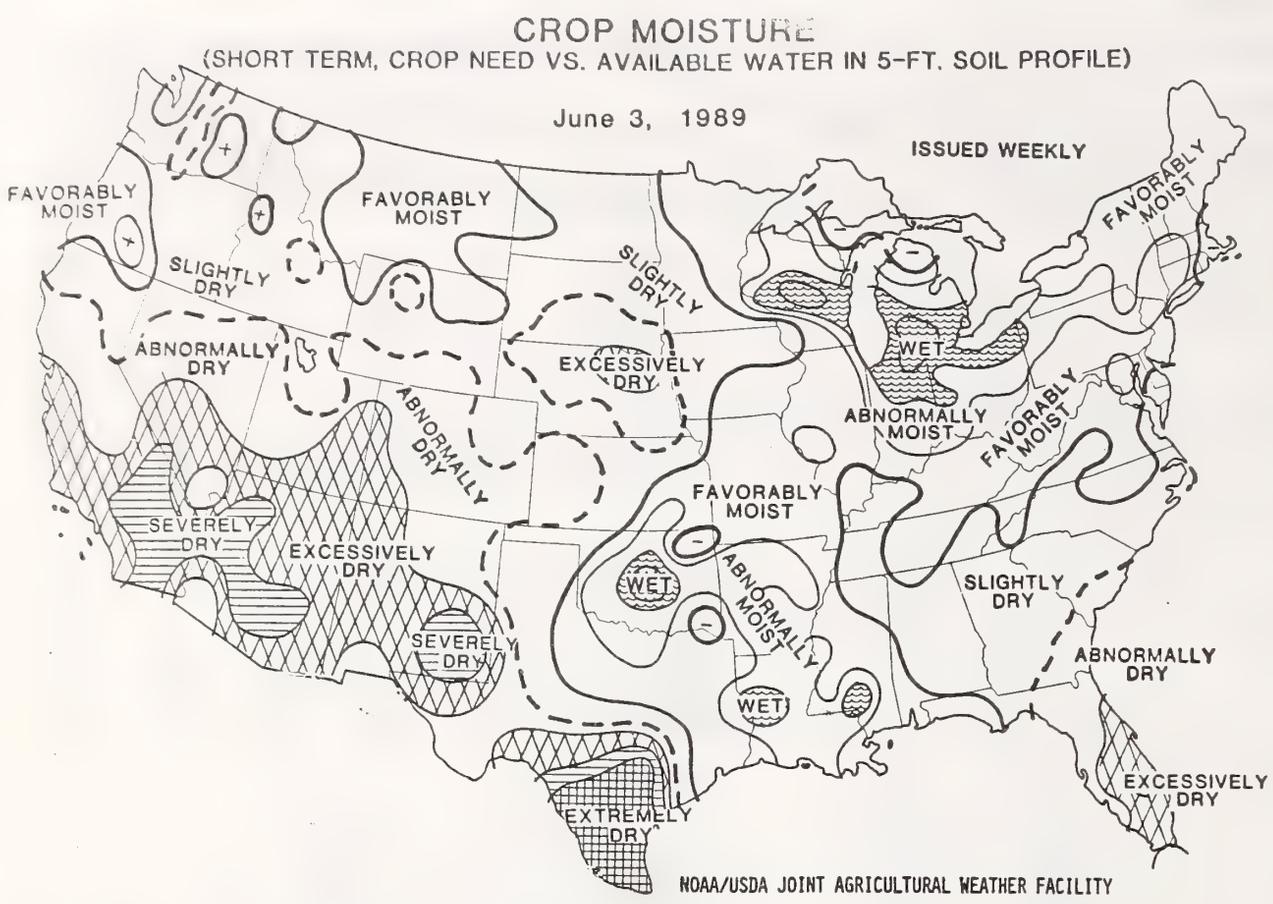
MONTANA CROP & LIVESTOCK PRICES RECEIVED INDEXES





NATION'S WHEAT SITUATION

Spring wheat planting lagged behind normal in four of the five major producing states during the first half of May. By the end of May, planting was nearly complete and emergence was near or ahead of normal except in Montana. Condition of the crop was mostly good to fair.

Winter wheat was mostly fair to poor during May. Inadequate soil moisture stressed winter wheat in the central and southern Great Plains. About midmonth, rain and cool temperatures reduced moisture stress in Oklahoma. Late in May, rain improved crop conditions in Kansas, but wheat was still mostly very poor to poor. At the end of May, harvest was underway in California, Georgia, Oklahoma, and Texas. Heading was 74% complete, 3 points ahead of normal.

APRIL EGG PRODUCTION DOWN 3% --LAYER NUMBERS DOWN 4%

U.S. egg production totaled 5.55 billion during April 1989, down 3 percent from the 5.75 billion produced a year ago. Production included 4.83 billion for table and 721 million for hatching eggs. The total number of layers during April averaged 267 million, down 4 percent from the 277 million a year ago. April egg production per 100 layers was 2,074 eggs, compared with 2,072 in April 1988.

All layers in the U.S. on May 1, 1989 totaled 266 million, compared with 276 million a year ago. The 266 million layers consisted of 228 million for table or commercial type eggs and 38.4 million for hatching type eggs. Rate of lay per day on May 1, 1989 averaged 68.6 eggs per 100 layers, up fractionally from a year ago, but down from the 69.6 on April 1, 1989.

Laying flocks in the 20 major egg production states produced 4.62 billion eggs during April, down 4 percent from the 4.80 billion produced a year ago. The number of layers during April averaged 223 million, down 4 percent from the 232 million a year ago.

Data for the 30 quarterly states were estimated based on the percent change in the 20 states making monthly surveys. These monthly states accounted for about 84 percent of the U.S. egg production and layer numbers during the 3-month period, December 1988 through February 1989.

CATTLE ON FEED IN 7 STATES UP 4 PERCENT FROM LAST YEAR

Cattle and calves on feed May 1, 1989, for slaughter market in the 7 States preparing monthly estimates totaled 7.85 million head, up 4 percent from a year ago and up 8 percent from May 1, 1987.

MARKETINGS of fed cattle during April totaled 1.57 million, down 2 percent from last year but up 2 percent from two years ago.

PLACEMENTS of cattle and calves on feed in the 7 States during April totaled 1.53 million, up 1 percent from last year but down 9 percent from April 1987. NET PLACEMENTS of 1.41 million for April are 2 percent above last year but down 9 percent below 1987.

OTHER DISAPPEARANCE totaled 129 thousand head, compared to 139 thousand for the last two years.

APRIL MILK PRODUCTION UP 2%

Milk production in the **21 selected States** totaled 10.8 billion pounds, 2 percent above production in these same States for April 1988.

During the January-March period the 21 selected States produced 85.1 percent of the U.S. production. If the producers in the remaining 29 States not surveyed on April 1 followed the same pattern as the 21 States, the U.S. production would be 12.7 billion pounds for April 1989.

APRIL RED MEAT PRODUCTION UP 6 PERCENT

Montana slaughter plants produced 1.11 million pounds of red meat during April 1989. This production is up 6 percent from last month, but is down 16 percent from April 1988.

Commercial red meat production for the **United States** in April 1989 totaled 3.13 billion pounds down 1 percent from April 1988. January-April red meat production, at 12.7 billion pounds was down 1 percent from last year. The percentage changes from 1988 accumulated production by individual components were: beef, down 3; veal, down 6; pork, up 3; lamb and mutton, up 2.

NUMBER OF WORKERS DOWN AND WAGE RATES INCREASE

A total of 2.81 million persons worked on the Nation's farms and ranches during the week of April 9-15, 1989. This number compares with 2.96 million workers during the comparable week in 1988. The workforce was comprised of 1.35 million self-employed farm operators, 423,000 unpaid workers, and 830,000 workers hired directly by farm operators. Rounding out the total were 198,000 agricultural service employees doing work on farms and ranches during the survey week.

The all hired farm worker wage rate for the April 1989 survey week averaged $5.35 per hour, up 35 cents from a year earlier. Workers paid on an hourly basis earned $5.06 per hour compared with $4.78 last April. Wage rates for field and livestock workers were $5.14 and $4.71, respectively. During April 1988, field workers made $4.76 while livestock workers averaged $4.51 per hour.

During the current survey week, self-employed persons worked an average of 39.6 hours, 5.9 fewer hours than in the comparable week in 1988. Unpaid workers, who worked 15 hours or more during the week, put in 34.1 hours compared with 36.4 hours a year earlier. Hired workers spent an average of 40.2 hours doing agricultural work, up 0.7 hour from April of last year.

Benefits in addition to cash wages, such as housing and meals, were provided to 47 percent of the hired workers employed on farms and ranches during the survey week. Last year 45 percent of the workforce received benefits in addition to cash wages. This year, 8 percent of the workers received both housing and meals, and another 14 percent received housing but no meals.

MAY 1 POTATO STOCKS

There were 65,000 cwt of potatoes in **Montana** storage on May 1, down significantly from the 300,000 cwt on hand May 1, 1988. Storages are nearly empty after having most of 1988 crop moved out as seed.

Potato stocks on hand May 1, 1989, in the **U.S.**, totaled 54.4 million cwt in the 15 storage States, down 22 percent from last year and 9 percent under two years ago. May 1 stocks account for 18 percent of fall production this season compared with 21 percent last year.

EGG RECEIPTS DECLINE

The value of **Montana** eggs produced in 1988, at 7.8 million, declined 9 percent from a year earlier. Egg production was 194 million dozen, down 5 percent from 1987. Eggs averaged 48 cents per dozen in 1988 while the average price in 1987 was 50 cents per dozen.

The **U.S.** combined value of production from broilers, eggs and turkeys and the value of sales from chickens, in 1988 was $12.5 billion, up 12 percent from the $11.2 billion in 1987. Of the combined total, 59 percent was from broilers, 24 percent from eggs, 16 percent from turkeys, and 1 percent from other chickens.

Chicken sold in 1988, excluding broilers, brought producers $174,000. The average price received, mostly for spent laying hens, was 6 cents per pound.

Value of egg production in 1988 was $3.06 billion, down 4 percent from the $3.18 billion in 1987. In 1988 eggs averaged 52.8 cents per dozen, compared with 54.9 cents in 1987.

WINTER WHEAT LOSS HITS 900,000 ACRES

Montana's wheat growers expect to harvest only 63 percent of the winter wheat planted last fall. Based on May 1 conditions, 1.5 million acres remain for harvest, down 29 percent from last year and the lowest winter wheat harvested acres since 1985.

The abandonment rate has been exceeded in only six years since records were started in 1909. However, in terms of total acres abandoned, the largest ever was in 1985 with 1.06 million acres (due to drought) followed by 900,000 acres so far this year, 761,000 acres in 1936, and 750,000 in 1979.

This year's winter wheat yield is forecast at 20 bushels per acre, only 1 bushel higher than last year's drought ravaged crop. However, full yield potential could be realized if moisture conditions remain favorable, while reseeding and above normal tillering thicken thin stands.

Montana's winter wheat production is forecast at 30 million bushels, 25 percent under last year and the lowest since 1985.

For the nation, winter wheat production is forecast at 1.43 billion bushels, down 8 percent from the 1.56 billion bushels produced in 1988 and is the lowest production level since 1978.

MILK PRODUCTION, DISPOSITION, & INCOME--1988

Montana's 1988 milk production at 352 million pounds, is up 13 million pounds from last year. The rate per cow, at 14,080 pounds, was up 4 percent from 1987. The annual average number of milk cows is 25,000--unchanged from last year's average.

Cash receipts from marketings of milk during 1988 totaled $41.3 million compared with $40.9 million last year. Producer returns averaged $12.28 per cwt., down 30 cents from the 1987 returns. Returns were $3.51 per pound of milkfat in 1988 and $3.57 per pound in 1987.

U.S. milk production increased 2 percent in 1988 to 146 billion pounds. The rate per cow, at 14,213 pounds, was 411 pounds above 1987. The annual average number of cows at 10.2 million head was 1 percent less than the average in 1987.

Cash receipts from marketings of milk during 1988, at $17.7 billion, was virtually unchanged from both 1987 and 1986. Producer returns averaged $12.33 per hundredweight, 29 cents below the 1987 average. Marketings totaled 143 billion pounds, 2 percent above 1987. Marketings include whole milk and producer-separated cream sold to plants and dealers as well as milk sold directly to consumers.

An estimated 2.24 billion pounds of milk were used on farms where produced, 1 percent below 1987. Calves were fed 72 percent of this milk with the remainder consumed in producer households as milk, cream, and butter.

MARCH MANUFACTURED DAIRY

Montana dairy plants produced 149,000 gallons of ice cream in March, up 46 percent from February, but down 4 percent from March 1988. Creamed cottage cheese output, at 251,000 pounds was up 4 percent from last month, but down 13 percent from last year. There were 208,000 pounds of lowfat cottage cheese produced, up 14 percent from last month, but down 2 percent from last year.

Butter production in March was 175,000 pounds, up 54 percent from February, and up 34 percent from March 1988.

U.S. butter production was 136 million pounds, 18 percent above March 1988 and 9 percent above February 1989.

Creamed cottage cheese production was 52.0 million pounds, 13 percent below March 1988 and 11 percent above February 1989. Lowfat cottage cheese production was 26.8 million pounds, 3 percent above March 1988 and 11 percent above February 1989.

March ice cream production was 72.4 million gallons, down 5 percent from last year. There were 4.54 million gallons of sherbet produced, up 2 percent from February 1988.

PASTURE & RANGE FEED CONDITION

Montana's pastures and ranges were slow to start this spring because of cool weather and dry soils. The condition on 73% is described as poor to fair, and is well above a year ago, but below the 85% rating in 1987. Ample rains and snow during late April have boosted range and pasture prospects significantly.

APRIL PRICES RECEIVED

Montana farmers and ranchers received higher and lower prices for crops in April compared with March, but all livestock prices sagged during that time.

Hay led the monthly price advance--going up $5/ton. Alfalfa hay is now a record $105/ton while all other hay is $94. Winter wheat prices decreased 2 cents/bu. to $4.00, and spring wheat went down 5 cents/bu. to $4.15. Durum, the highest priced of Montana wheat went up 16 cents/bu. to $4.65. Barley prices went up 5 cents/bu., to $2.81.

Beef cows dropped $.60/cwt to $46.30, and steers and heifers sagged $.90/cwt to $75.00.

The Montana prices received index in April for all farm products at 180 (1977=100) is 6 points lower than the March index. The all crops index at 176 is unchanged, while the livestock and products index at 185 is down 10 points from March.

The April all farm products index of prices received by **U.S.** farmers decreased 3 points from March to 146 percent of its January-December 1977 average, decreases in the prices of cattle, eggs, hogs, soybeans, and lettuce were partially offset by higher prices for tomatoes, oranges, and potatoes. The index was 16 points above a year ago.

The April index of prices paid for commodities and services, interest, taxes, and farm wage rates was 177 (1977=100), 2 points above January 1989 and 9 points above April 1988. Higher prices for fuels, fertilizers, seeds, autos and trucks, tractors, and other machinery contributed most to the increase in the index since January. Lower prices for feed and feeder cattle and calves were partially offsetting.

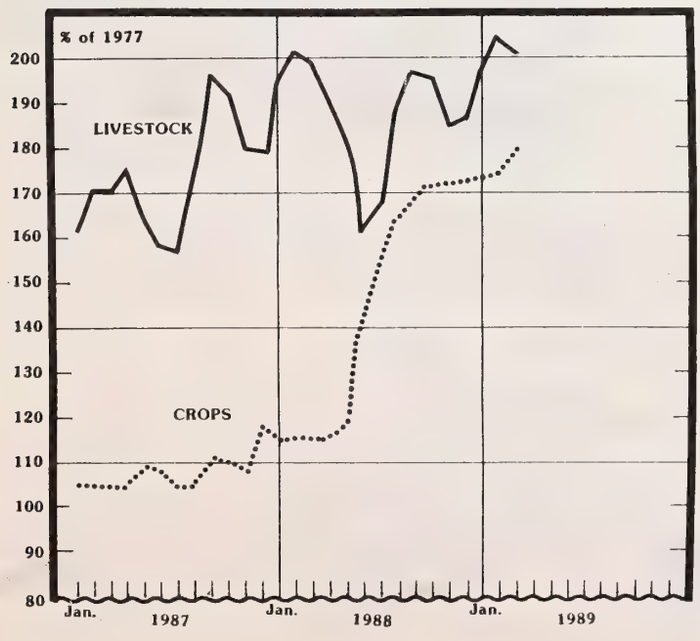
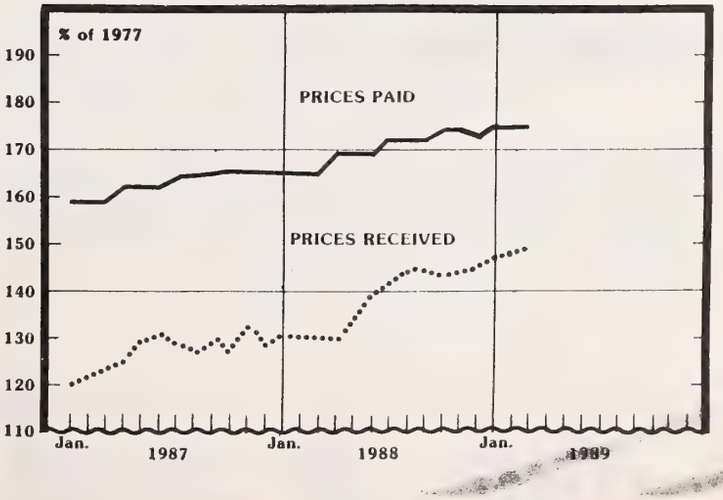
MONTANA CROP & LIVESTOCK PRICES RECEIVED INDEXES



UNITED STATES INDEX NUMBERS OF PRICES PAID & PRICES RECEIVED



SECOND CONSECUTIVE INCREASE IN U.S. FARMLAND VALUES

The latest farmland values figures are now available from USDA and they are mostly good news for farmers and ranchers. **U.S.** farmland values rose an average of 6 percent from February 1988 to February 1989. That's on top of a three percent increase a year ago, but follows 5 consecutive years of declining values. Although it appears that farmland values are clearly on their way up, they are still 27% below the 1982 peak.

The biggest increases again were recorded in the Northeast (up 13%), followed by the Corn Belt (up 10%), and the Northern Plains (up 9%). A look at the Mountain States shows the region's farmland values increased for the first time in 5 years. The Mountain Region was up 1% in 1989 following a 3 percent decline a year ago.

A look at **Montana's** farmland shows values of land and buildings averaged $167/acre in 1989, up 2% and the first increase since 1984. Higher land values reflect the higher prices producers are receiving for most crops and livestock and a more optimistic outlook for the health of the agricultural industry.

CATTLE ON FEED UP 3 PERCENT IN 13 QUARTERLY STATES

Cattle and calves on feed April 1, 1989, for slaughter market in the 13 quarterly States totaled 9.68 million head, up 3 percent from April 1, 1988, and 10 percent above 1987.

The cattle on feed inventory included 6.19 million steers and steer calves, 1 percent above last year and 8 percent above 1987. This group represented 64 percent of the total April number on feed, compared to 65 percent for both last year and 1987. Heifers and heifer calves accounted for 3.45 million, 6 percent above a year ago and up 13 percent from 1987.

PLACEMENTS of cattle and calves on feed during the January-March 1989 quarter totaled 6.21 million, up 7 percent from last year and 9 percent above the comparable period in 1987. This is the largest first quarter placements in the last 18 years. OTHER DISAPPEARANCE of 344 thousand head leaves NET PLACEMENTS at 5.87 million.

MARKETINGS of fed cattle for slaughter during January-March totaled 5.60 million, 4 percent below 1988 and 3 percent below the same period in 1987.

EXPECTED MARKETINGS FOR APRIL-JUNE UP 4%

Cattle feeders expect to market 6.09 million head during the April-June quarter of 1989. This would be up 4 percent from the second quarter marketings in 1988 and up 8 percent from 1987.

CATTLE ON FEED IN 7 MONTHLY STATES UP 3%

Cattle on feed April 1, 1989, in the 7 monthly States totaled 8.01 million, 3 percent more than the previous year and 11 percent more than two years ago. This is the largest April 1 number on feed since 1978. Placements in feedlots during March totaled a record 1.98 million, 7 percent more than last year and 15 percent above 1987. Marketings during March totaled 1.55 million, down 2 percent from March 1988 and 1 percent below March 1987. OTHER DISAPPEARANCE during March was 75 thousand head, 29 percent below last year and 16 percent below 1987.

MONTANA SHEEP & LAMB LOSSES--1988

Montana sheepmen lost 150,000 sheep and lambs to weather, predators, disease and other causes in 1988. Total loss was 9 percent higher than 1987 and represented a value of $9.0 million. The 1988 dollar loss was 7 percent higher than the previous year.

Predators caused a $2.5 million loss, non-predator factors caused $5.1 million and unknown causes claimed $1.4 million.

Coyote predation remained the single largest cause of death with a $1.8 million loss. This is 20 percent of total value of death losses.

Lambs killed by all predators amounted to 33,600, up 10 percent from last year. Sheep killed by predators totaled 9,500, up 48 percent.

Lambs lost to weather, disease, and other non-predator causes totaled 50,800, up 5 percent from 1987. Sheep losses to non-predator factors totaled 33,900, 8 percent more than last year.

Lambs lost to unknown causes were 15,600, up 20 percent, and sheep were 6,600, down 10 percent from last year.

MARCH EGG PRODUCTION and LAYER NUMBERS DOWN 4 PERCENT

U.S. Egg production totaled 5.77 billion during March 1989, down 4 percent from the 6.03 billion produced a year ago. Production included 5.04 billion for table and 739 million for hatching eggs. The total number of layers during March averaged 270 million, down 4 percent from the 280 million a year ago. March egg production per 100 layers was 2,139 eggs, compared with 2,151 in March 1988.

All layers in the U.S. on April 1, 1989 totaled 269 million, compared with 278 million a year ago. The 269 million layers consisted of 230 million for table or commercial type eggs and 38.9 million for hatching type eggs. Rate of lay per day on April 1, 1989 averaged 69.6 eggs per 100 layers, the same as a year ago, but up from the 68.3 on March 1, 1989.

Laying flocks in the 20 major egg production states produced 4.81 billion eggs during March, down 5 percent from the 5.06 billion produced a year ago. The number of layers during March averaged 225 million, down 4 percent from the 235 million a year ago.

Data for the 30 quarterly states were estimated based on the percent change in the 20 states making monthly surveys. These monthly states accounted for about 84 percent of the U.S. Egg production and layer numbers during the 3-month period, December 1988 through February 1989.

POTATO STOCKS DOWN 14 PERCENT

There were 1.2 million cwt. of potatoes stored in **Montana** on April 1, compared with 1.4 million a year earlier. The April 1 stocks represent 56 percent of the 1988 crop while 59 percent of the crop was in storage on April 1, 1988.

April 1, 1989 potato stocks in the **U.S.** are set at 86.7 million cwt, a drop of 18 percent from a year ago and 9 percent below two years ago. Current stocks account for 29 percent of fall potato production compared with 32 percent a year ago.

WESTERN STATES stored a total of 67.8 million cwt on April 1, 1989, a drop of 14 percent from last year and 6 percent under two years ago. Idaho, down 9 percent, and Washington, down 7 percent, dominate the Western storage total. California is down nearly one-half, Oregon, one-third below a year ago stocks, and Colorado stocks are off 20 percent.

JANUARY-MARCH MILK PRODUCTION

Milk production during the January-March quarter in **Montana** was estimated at 84 million pounds, unchanged from the same period last year. Average production per cow, at 3,350 pounds, and the number of milk cows, at 25,000 head, were the same as last year. Montana's dairymen fed milk cows an average of 15.0 pounds of grain and concentrates per head per day, down 0.5 pounds from 1988. The cost per hundredweight of feed was $7.35 compared with $6.40 in 1988.

The quarterly production of milk for the **U.S.** was 36.6 billion pounds, 1 percent above January-March 1988. The average number of cows in the U.S. during the January-March quarter was 10.2 million head, 1 percent below January-March 1988, and was down slightly from October-December 1, 1988.

Grain and other concentrates fed to milk cows on April 1, 1989, averaged 17.7 pounds, 0.2 pounds more than April 1, 1988. The value of grain and other concentrates fed to cows on April 1, 1989, averaged $8.36 per hundredweight, $1.24 per hundredweight more than the April 1, 1988 value.

MARCH RED MEAT PRODUCTION

Montana slaughter plants produced 1.04 million pounds of red meat during March 1989. This production is up 19 percent from last month, but down 23 percent from March 1988.

The number of cattle slaughtered at 1,200 head, was down 200 head from a year earlier. The average liveweight of cattle slaughtered was 1,023 pounds compared with 1,095 in March 1988. Hog slaughter at 2,100 head, was down 400 head from last year. Average for hogs slaughtered was 236 pounds, up 2 pounds per head from a year ago.

Commercial red meat production for the United States in March 1989 totaled 3.33 billion pounds down 1 percent from March 1988. January-March red meat production, at 9.60 billion pounds was down 1 percent from last year. The percentage changes from 1988 accumulated production by individual components were: beef, down 3; veal, down 6; pork up 3; lamb and mutton, up 2.

Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

1988 MEAT ANIMAL PRODUCTION, DISPOSITION, and INCOME

Montana's total marketings of meat animals in 1988 was 1,126 million pounds, 4 percent more than the 1,086 million pounds marketed during 1987. Cash receipts from these marketings, at $743.3 million, increased 10 percent from a year earlier.

The increase in cash receipts were led by cattle receipts of $693.3 million, up 11 percent from last year. Total hog receipts of $30.6 million declined 2 percent from 1987 while cash receipts from sheep at $19.3 million declined 17 percent.

Total U.S. marketings of meat animals increased 2 percent during 1988 as decreased cattle marketings were offset by larger hog and sheep marketings. With higher prices received for cattle and lower prices for hogs and sheep, the resulting total cash receipts was $46.0 billion, up 4 percent from 1987.

The percentage breakdown of contributions to total U.S. cash receipts from marketings of meat animals by species in 1988 were: cattle and calves, 79 percent; hogs and pigs, 20 percent; sheep and lambs, 1 percent.

Monthly Prices Received
U.S. Hog Inventory
Wheat & Barley Movement

FEBRUARY MANUFACTURED DAIRY

Montana dairy plants produced 102,000 gallons of ice cream in February, up 9 percent from February 1988. Creamed cottage cheese output, at 241,000 pounds was down 2 percent from last month and down 15 percent from last year. There were 182,000 pounds of lowfat cottage cheese produced, up 2 percent from last month and up 6 percent from last year.

Butter production in February was 114,000 pounds, down 8 percent from January, and down 13 percent from February 1988.

U.S. butter production was 125 million pounds, 7 percent above February 1988 but 3 percent below January 1989. Creamed cottage cheese production was 46.9 million pounds, 13 percent below February 1988 and 1 percent below January 1989. Lowfat cottage cheese production was 24.1 million pounds, 11 percent above February 1988 and virtually unchanged from January 1989.

February ice cream production, at 59.0 million gallons, was down 7 percent from last year. There were 3.46 million gallons of sherbet produced, up 9 percent from February 1988.

PROSPECTIVE PLANTINGS

Montana farmers, facing the prospects of good spring soil moisture, intend to plant 7 percent more acres this year than last. Relaxation of government acreage controls is also impacting planting intentions.

The state's all wheat crop is expected to be 5.25 million acres, 11 percent more than a year ago. By class, winter wheat which is already planted is down 2 percent, hard spring wheat at 2.5 million acres will be up 25 percent, and durum will be up 25 percent with 350 thousand acres planted.

Barley plantings at 1.7 million acres would be down 6 percent from a year ago. Oats intended plantings at 300 thousand acres are up 43 percent, sugarbeets at 53 thousand acres are up 7 percent, dry beans at 7500 acres are up 70 percent, while corn at 85 thousand acres are down 6 percent. The expected harvest of all hay at 2.2 million acres would be up 22 percent.

Nationally, hard spring wheat growers plan to seed 15.7 million acres, up 17 percent; the largest area since 1982. Durum wheat acreage is expected to total 3.86 million acres, up 16 percent and the highest level since 1982. Winter wheat seeded acres are estimated at 54.7 million acres, up 12 percent. Barley intended plantings at 9.62 million acres are down 1 percent. Oats at 13.2 million acres would be down 5 percent.

Corn growers intend to plant 73.3 million acres in 1989, up 8 percent from last year. Hay harvest at 63.1 million acres is 4 percent less than last year but 4 percent more than 2 years ago. Dry edible bean intentions call for 1.67 million planted acres in 1989, up 11 percent from last year but 7 percent below two years ago.

MARCH PRICES RECEIVED HIGHER

Montana farmers and ranchers received higher prices for most crops in March compared with February, but all livestock prices except sheep sagged during that time.

Hay led the monthly price advance going up $7/ton. Alfalfa hay is now a record $100/ton while all other hay is $90. Winter wheat prices increased 17 cents/bushel to $4.10, and spring wheat went up 14 cents/bu. to $4.25. Durum, the highest priced of Montana wheat went down 18 cents/bu. to $4.85. Barley prices remained steady at $2.98/bu.

Beef cows dropped $1.20/cwt. to $46.60, and steers and heifers sagged $1.30/cwt. to $78.50.

The Montana prices received index in March for all farm products at 191 (1977=100) is 1 point higher than the February index. The all crops index at 180 is up 6 points, while the livestock and products index at 202 is down 3 points from February.

Nationally, the March all farm products index of prices received by farmers increased 1 point from February to 149 percent of its January-December 1977 average. Increases in the price of eggs, broilers, wheat, and potatoes were partially offset by lower prices for tomatoes, oranges, milk, and strawberries. The index was 19 points above a year ago.

Market egg prices were at their highest level since April of 1984 while the average broiler price increased moderately from February. Feed grain and soybean prices also increased from a month earlier, and the all wheat price was at the highest level since February of 1981. Most fruit and vegetable prices were lower than a month earlier. Cattle and hog prices were down slightly from February.

U.S. HOG INVENTORY SLIGHTLY HIGHER

U.S. inventory of all hogs and pigs was estimated at 52.5 million head on March 1, 1989, compared with 52.3 million on hand a year earlier.

-- Breeding hog inventory, at 7.01 million, was 2 percent below last year.
-- Market hog inventory, at 45.5 million, was 1 percent above a year ago.

The U.S. pig crop for December 1988-February 1989 totaled 20.8 million head, 1 percent below 1988 but 7 percent above the 1987 pig crop. A total of 2.67 million sows farrowed during December 1988-February 1989, 2 percent below a year earlier but 6 percent above the same period two years ago. The litter size during this period averaged 7.78, a new record high, compared to the last two years of 7.73.

U.S. hog producers intend to have 3.19 million sows farrow during the March-May 1989 period, 3 percent below the actual farrowings a year ago. Farrowing intentions for the June-August 1989 period of 2.94 million sows, is 4 percent below the actual farrowings a year earlier.

MONTANA WHEAT and BARLEY MOVEMENT

Montana wheat shipped to out-of-state destinations during June-November 1988 was 45 percent below the same period last year. Rail movement amounted to 26.6 million bushels, down from 51.7 million in 1987. Trucks carried 6.8 million bushels compared with 8.9 million the previous June-November period.

Shipments to western destinations (primarily export facilities of Washington and Oregon) were 45 percent below the previous period. Wheat movement to eastern destinations was down 53 percent. Shipments to other destinations were down 58 percent.

Montana barley shipped to out-of-state destinations during June-November 1988 was 16.4 million bushels, 10 percent above the same period last year.

Movement to eastern destinations was nearly 11 times as much as the June-November 1987 volume. Movement west was down 63 percent and other destinations were 25 percent below the previous year.

DECEMBER THROUGH FEBRUARY EGG PRODUCTION DOWN 14 PERCENT

Montana poultry men produced 42 million eggs during the quarter ending February 28, 1989, 14 percent less than during the same quarter of 1988. The average number of **layers** on hand in the December through February period was 700,000 layers, down from 780,000 layers on hand during the same period last year. **Rate of lay** during the quarter averaged 60.0 eggs per 100 layers compared with 62.4 eggs per 100 layers during this quarter in 1988.

The **Nation's** laying flocks produced 16.7 billion eggs during the December through February quarter, down 6 percent from the corresponding quarter a year ago. Production included 14.7 billion for table eggs and 2.05 billion for hatching eggs. Layers for the quarter averaged 272 million, down 4 percent from the 285 million a year ago.

All layers in the U.S. on March 1, 1989 totaled 271 million, compared with 282 million a year ago. The 271 million layers consisted of 232 million table or commercial type eggs and 38.9 million hatching type eggs. **Rate of lay** per day on March 1, 1989 averaged 68.3 eggs per 100 layers compared with 69.2 for March 1, 1988 and 67.2 on February 1, 1989.

Laying flocks in the 20 major egg production states produced 4.31 billion eggs during February, down 9 percent from the 4.74 billion produced a year ago. The number of layers during February averaged 227 million, down 5 percent from a year ago.

CATTLE ON FEED

Cattle and calves on feed March 1, 1989, for slaughter market in the 7 States preparing monthly estimates totaled 7.66 million head, up 1 percent from a year ago and up 7 percent from March 1, 1987.

MARKETINGS of fed cattle during February totaled 1.51 million, down 2 percent from last year but up 2 percent from two years ago.

PLACEMENTS of cattle and calves on feed in the 7 States during February totaled 1.59 million, up 15 percent from last year and up 10 percent from February 1987. This is the largest number of February placements since 1972, when the 7-State series began.

NET PLACEMENTS of 1.47 million for February are 17 percent above last year and 10 percent above 1987.

OTHER DISAPPEARANCE totaled 115 thousand head, compared to 126 thousand during February 1988 and 105 thousand during February 1987.

1988 RED MEAT PRODUCTION

Montana's 1988 red meat production totaled 16.2 million pounds, down 11 percent from 1987. There were 18,200 head of cattle slaughtered, down 18 percent from a year earlier. Hog slaughter for 1988 totaled 30,300 head, up 11 percent from last year. There were 2,600 head of sheep and lambs slaughtered, down 10 percent from 1987.

Red meat production for the United States during 1988 totaled 40.0 billion pounds up 3 percent from 1987. Production included beef, veal, pork, lamb and mutton slaughter in commercial establishments and on farms.

Beef production was 23.6 billion pounds virtually unchanged from 1987. Veal production was 395 million pounds down 8 percent from 1987. Pork production was 15.7 billion pounds up 9 percent from 1987. Lamb and mutton production totaled 335 million pounds, up 6 percent from 1987. Lard production, at 938 million pounds, was up 9 percent.

1/ Includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms. 2/ Includes total beef, veal, pork, lamb and mutton, excludes farm slaughter. 3/ Months may not add to totals due to rounding.

Commercial cattle slaughter during 1988 totaled 35.1 million head, down 2 percent from 1987, with federal inspection comprising 97.1 percent of the total. Calf slaughter, at 2.51 million head, down 11 percent from the previous year with 96.2 percent under federal inspection. Hog kill totaled 87.8 million head, up 8 percent from 1987, with federal inspection comprising 97.4 percent. Commercial sheep and lamb slaughter, at 5.29 million head, was up 2 percent from 1987 with federal comprising 96.8 percent.

Average live weight of cattle slaughtered commercially in 1988 was 1,120 pounds, up 15 pounds from 1987. The calf average live weight was 258 pounds for 1987, an increase of 9 pounds from the previous year. Average live weight for hogs increased 2 pounds to 249. Sheep and lambs averaged 124 pounds live weight, up 5 pounds from 1987.

FEBRUARY RED MEAT PRODUCTION DOWN

Montana slaughter plants produced 875,000 pounds of red meat during February 1989. This production is down 22 percent from last month, and down 24 percent from February 1988.

The number of cattle slaughtered, at 1,000 head, was down 200 head from a year earlier. The average liveweight of cattle slaughtered was 998 pounds compared with 1,098 pounds in February 1988. Hog slaughter, at 1,900 head, was down 200 head from last year. Average liveweight of hogs slaughtered was up 4 pounds per head from a year ago.

Commercial red meat production for the **United States** in February 1989 totaled 3.00 billion pounds, down 2 percent from February 1988. January-February red meat production, at 6.27 billion pounds was down 1 percent from last year. The percentage changes from 1988 accumulated production by individual components were: beef, down 4; veal, down 6; pork, up 3; lamb and mutton, up 8. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

1988 MONTANA WOOL PRODUCTION UP 8 PERCENT

Montana wool growers produced 5.6 million pounds of wool in 1988, 8 percent more than in 1987. The number of sheep and lambs shorn was up 4 percent at 533,000 head. The average fleece weight of 10.5 pounds was up .4 of a pound.

The increased wool production reflects a turn around in sheep inventory and wool production. The 1988 wool crop ended a 5-year decline in production. It also reflects the larger inventory that first became evident in January 1987.

U.S. wool production was up 5 percent at 89.2 million pounds in 1988 compared with 1987. The number of sheep and lambs shorn was also up 5 percent of 11.5 million head. Average fleece weight was 7.78 pounds per head, up .03 pounds from 1987.

FEBRUARY MILK PRODUCTION

Milk production in the 21 selected States during February totaled 9.83 billion pounds, virtually the same as February 1988.

Production per cow in the 21 selected States averaged 1,148 pounds for February, 13 pounds more than February 1988.

The number of cows on farms in the 21 selected States was 8.56 million head, 15 thousand less than January 1989 and 95 thousand head below February 1988.

During the October-December 1988 period the 21 selected States produced 85.1 percent of the U.S. production. If producers in the remaining 29 States not surveyed March 1 followed the same production pattern as the 21 States, then the U.S. production would be 11.5 billion pounds for February.

AG EXPORT VALUE MAY RISE $1 BILLION

U.S. agricultural export value should continue rising in fiscal 1989. Value is expected to grow $1 billion to $36.5 billion. World prices for wheat, corn, and soybeans are expected to be the highest since 1985. A $2.5 billion increase expected for grain and feed exports will more than offset prospective declines for cotton and oilseeds.

The volume of exports is expected to fall 8 percent to 136 million tons. Export volume is forecast smaller as the U.S. share of world trade shrinks for drought-affected products.

Exports of high-value products are expected to remain close to fiscal 1988's record $16.4 billion, sustained by favorable exchange rates and relatively strong world economic growth. This is especially true for horticultural products. In fact, U.S. exports of horticultural products are forecast at a record $4.1 billion, up $400 million from last year.

U.S. agricultural imports are expected to match 1988's record $21 billion. Imports of competitive products likely will fall for the first time since 1982. The U.S. agricultural trade surplus is expected to rise to $15.5 billion in 1989, a $1.7 billion increase.

For U.S. agriculture, the challenge in the coming year will be to sustain the export momentum that has been regained over the past few years. This will require competitive prices, aggressive market development, persistent trade policy efforts, and market-oriented trade.

U.S. CROPS LIKELY TO REBOUND

Three developments point to expanded U.S. acreage for grains and oilseeds and higher yields in 1989:

- lower acreage reduction requirements for Government program participation,
- higher crop prices, and
- the historical pattern of yields increasing following a drought year.

In 1988, the United States set aside from production 78 million acres. Of this total, 54 million were under annual programs and can be brought back into production rather quickly.

Because of drought-reduced supplies, acreage reduction requirements for participation in the farm program have been lowered for most 1989 crops. For wheat, the requirement has been lowered from 27.5 percent to 10. For corn, the requirement has been lowered from 20 percent to 10, and the paid land diversion has been reduced from 10 percent to zero. However, the acreage reduction for cotton has been increased from 12.5 percent to 25 percent.

Some 43 million acres were removed from wheat and feed grain production in 1988 under annual programs. Perhaps half this total will come back into production in 1989. Soybean area could be up 1-3 million acres.

If yields are weighted together for major crops (wheat, rice, corn, sorghum, barley, oats, and soybeans), data show that yields usually rebound from severely reduced levels caused by bad weather.

HELENA, MONTANA 59604

The normal trend increase is about 1.5 percent per year, and the trend projection for 1989 shows yields increasing almost 30 percent from 1988. The United States will have adequate crop supplies until new crops become available in 1989. Given average weather, these new crops could be up around 50 percent in response to expanded acreage and higher yields. Even so, with strong domestic and export use, stock rebuilding will be modest.

SPECIALTY CROPS GAIN IMPORTANCE

The National Agricultural Statistics Service program calls for state estimates of major crops and livestock. One area that's rapidly expanding in importance is specialty crops. We're seeing an expanded interest in sunflower seed, safflower, and canola. Grass seed production has also become more popular.

Consumers are also developing a taste for exotic fruits and vegetables. Chili pepper production has boomed--Boston and Romaine lettuce, bok choy, casaba melon, kiwifruit, and mangos have found ready markets. Another crop that can be found growing wild in the Pacific Northwest that we used to find in Wisconsin is morel mushrooms. We found this spongy-looking mushroom in the woods near dead elm trees. Morels are delicious sauteed as a side dish.

As demand for these many new and different foods expands, more demand is generated for statistics on how much is produced and where. Perhaps more of these specialty items could be profitably produced in Montana.

JANUARY MANUFACTURED DAIRY

Montana dairy plants produced 30,000 gallons of ice cream in January, down 74 percent from December, and down 69 percent from January 1988. Creamed cottage cheese output, at 247,000 pounds was up 4 percent from December, but down 9 percent from last year. There were 178,000 pounds of lowfat cottage cheese produced, up 9 percent from last month. Butter production in January was 124,000 pounds, down 10 percent from December, but up 10 percent from January 1988.

U.S. butter production was 129 million pounds, 3 percent above January 1988 and 16 percent above December 1988. Creamed cottage cheese production was 47.6 million pounds, 7 percent below January 1988 but 2 percent above December 1988. Lowfat cottage cheese production was 24.1 million pounds, 15 percent above January 1988 and 17 percent above December 1988.

January ice cream production, at 56.0 million gallons was up 3 percent from last year. There were 3.19 million gallons of sherbet produced, up 19 percent from January 1988.

POTATO STOCKS DOWN

Potato stocks on hand March 1 in **Montana** totaled 1.8 million cwt., 9 percent less than a year earlier. Stocks in storage represent 85 percent of the 1988 production.

For the Nation, March 1 potato stocks are set at 119 million cwt, down 14 percent from last year and 8 percent below two years ago. The percentage drop continues to widen compared with last year as the season progresses. January was 12 percent below a year earlier and february was down 13 percent. The 15 Major Stocks States are now holding 40 percent of fall production compared with 42 percent last year.

Potato stocks in the six Western States totaled 90.3 million cwt on March 1, 1989, down 8 percent from last year and 3 percent below 1987. This is the lowest March 1 level in the west for the past four years. Idaho and Washington, with 77 percent of the western stocks, are down 4 and 1 percent, respectively. Oregon stocks are down 26 percent and California is down 35 percent. Colorado potato storage, going mostly to fresh market, is down 16 percent.

Disappearance of fall potatoes from 1988 harvest to March 1, 1989, totaled 180 million cwt, down 7 percent from last year but 1 percent above the 1986 season. Shrinkage and loss of 20.8 million cwt this season is running 6 percent below last year's 22.2 million cwt and 2 percent below the 21.3 million cwt lost two years ago. February disappearance was 25.7 million cwt, 9 percent less than last year's 29 day total of 28.3 million cwt and slightly below 1987.

Processing has taken 80.8 million cwt of potatoes (not including chips) so far this season. This is 5 percent below last year but 5 percent above two years ago. February processing used 12.2 million cwt, down 8 percent from a year ago.

(See table on next page.)

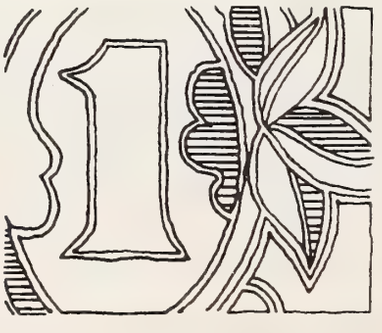
MONTANA 7th IN DISASTER PAYMENTS

USDA has provided about $2.73 bil. in 1988 disaster assistance to 558,483 farmers as of the end of last week. Of that amount, $2.47 bil. is in Crop Loss Program payments to 490,877 producers. These are primarily farmers in drought designated counties who had losses of 35% or more in crop production last year.

Additional disaster payments of $242 mil. have been paid to 82,119 farmers in Emergency Feed Program aid. The CCC paid up to half the cost of abnormal feed purchases by farmers who suffered a loss in normal feed production in drought counties. Another $12.0 mil. in Emergency Feed Assistance has been provided to 7,204 farmers in net gain benefits for reduced-price CCC grain these farmers bought to hold their foundation herds together. Forage Assistance payments of $241,788 have been paid to 173 farmers, and $32,814 in Tree Assistance to 17 producers.

Average disaster assistance for Crop Loss program losses comes to $5,037 per farmer; for Emergency Feed, $2,942; for Emergency Feed Assistance, $1,663; for Forage Assistance, $1,398; and for Tree Assistance, $1,930. Average assistance per farmer overall is $4,882. Here are the top 10 States in totaled disaster assistance:

STATE	CROP LOSS	FEED	TOTAL
	$Mil.	$Mil.	$Mil.
N Dakota	359.1	6.99	366.1
Illinois	307.8	5.53	313.4
Minnesota	249.2	13.04	262.2
Iowa	246.4	6.98	253.4
Wisconsin	201.8	19.27	221.1
S Dakota	167.8	10.45	178.3
Montana	149.3	23.17	172.5
Texas	114.9	23.61	138.5
Indiana	86.8	1.94	88.7
Missouri	51.1	25.84	77.0



Farmers may apply for disaster assistance on 1988 losses until the 31st of March. USDA budgeted $3.9 bil. for the disaster program that became effective last August 26. Livestock feed payments, which USDA was already making before the Emergency Disaster legislation was passed, became a part of this program on August 26. The crop loss portion of the program kicked off in mid-October.

FEBRUARY PRICES RECEIVED

The February 1989 index of prices received by **Montana** farmers and ranchers increased 2 points from January. The index, at 188 percent of the 1977 average, was 27 points above the February 1988 index.

The crops index moved up 1 point from the previous month. Increases for wheat and barley were partially offset by decreases for oats and hay.

The livestock index moved up 4 points in spite of declines for calves, steers and heifers, lambs, sheep, and eggs. Cows were up $1.80 per cwt. and as marketings shifted seasonally toward steers and heifers the meat animal index moved up 3 points.

Compared with last year most Montana agricultural commodities were up, except for lower cow, calf, hog, sheep and lamb prices.

The February all farm products index of prices received by **U.S.** farmers decreased 1 point from January to 148 percent of its January-December 1977 average. Lower prices for soybeans, lettuce, milk, and corn were partially offset by higher prices for tomatoes, strawberries, potatoes, and hay. The index was 18 points above a year ago.

Prices of food grains increased from January to February while feed grains and oilseed prices decreased. The all wheat price moved to the highest level since April of 1981, but the average corn and soybean price dropped from January to February. Tomato prices moved up sharply from a month earlier. The February average prices for all cattle and all calves under 500 pounds were at their highest levels since May of 1979.

CATTLE ON FEED IN 7 STATES DOWN 2 PERCENT FROM LAST YEAR

Cattle and calves on feed February 1, 1989, for slaughter market in the 7 States preparing monthly estimates totaled 7.70 million head, down 2 percent from a year ago but up 5 percent from February 1, 1987.

MARKETINGS of fed cattle during January totaled 1.67 million, down 5 percent from last year and down 7 percent from two years ago.

PLACEMENTS of cattle and calves on feed in the 7 States during January totaled 1.71 million, up 3 percent from last year and up 8 percent from January 1987. This is the largest number of January placements since 1974.

NET PLACEMENTS of 1.61 million for January are 3 percent above last year and 10 percent above 1987.

OTHER DISAPPEARANCE totaled 104 thousand head, compared to the 106 thousand during January 1988 and 127 thousand during January 1987.

JANUARY RED MEAT PRODUCTION

Montana slaughter plants produced 1.1 million pounds of red meat during January 1989. This production is down 8 percent from last month, and down 13 percent from January 1988.

The number of cattle slaughtered, at 1,200 head, was down 200 head from a year earlier. The average liveweight of cattle slaughtered was 984 pounds, compared with 1,187 pounds in January 1988. Hog slaughter, at 2,400 head, was unchanged from last year. Average liveweight of hogs slaughtered, at 235 pounds, was only slightly lower than a year ago.

Commercial red meat production for the **United States** in January 1989 totaled 3.27 billion pounds--up 1 percent from January 1988. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

Beef production, at 1.90 billion pounds, was down 3 percent. Head kill totaled 2.79 million, down 5 percent from last year. The average live weight increased 28 pounds to 1,147. Veal production, at 32.0 million pounds, was unchanged from last year. Calf slaughter totaled 203 thousand head, down 5 percent, and the average live weight increased 17 pounds to 264.

Pork production, at 1.31 billion pounds was up 5 percent. Hog kill totaled 7.33 million head, up 5 percent. The average live weight increased 1 pound to 249. Lamb and mutton production, at 27.0 million pounds, was up 13 percent from last year. Slaughter totaled 429 thousand head, up 10 percent. The average live weight increased 4 pounds to 126.

FARM WAGES AVERAGED $5.51 FOR JANUARY

There were 2.47 million people working on the Nation's farms and ranches during the week of January 8-14, 1989. Self-employed farm operators accounted for 1.28 million of the total, along with 337,000 unpaid workers, and 701,000 workers hired directly by farm operators. Agricultural service employees doing work on farms and ranches during the survey week made up the remaining 152,000 workers.

Farm operators paid their hired workers an average wage of $5.51 per hour during the January 1989 survey week. Workers paid on an hourly basis earned $5.14 per hour. Field workers received an average of $5.33 per hour, while livestock workers earned $4.83. Supervisors were paid $8.49 per hour and other workers earned $6.47.

Self-employed farm operators worked an average of 32.8 hours during the week. Unpaid workers averaged 32.8 hours and hired employees worked 37.9 hours.

Benefits in addition to cash wages, such as housing and meals, were provided to 53 percent of the hired workers during the survey week. Seven percent of the workers received both housing and meals, and another 16 percent received housing but no meals.

...NUARY EGG PRODUCTION & LAYER NUMBERS DOWN 5% FROM 1988

U.S. egg production totaled 5.72 billion during January 1989, down 5 percent from the 6.03 billion produced a year ago. Production included 5.02 billion for table eggs and 703 million for hatching eggs. The total number of layers during January averaged 272 million, down 5 percent from the 285 million a year ago. January egg production per 100 layers was 2,107 eggs, compared with 2,113 in January 1988.

All layers in the U.S. on February 1, 1989 totaled 272 million, down 5 percent from a year ago. The 272 million layers consisted of 234 million for table or commercial type eggs and 37.8 million for hatching eggs. Rate of lay per day on February 1, 1989 averaged 67.2 eggs per 100 layers compared with 68.1 on February 1, 1988 and 68.7 on January 1, 1989.

Laying flocks in the 20 major egg production states produced 4.79 billion eggs during January, down 5 percent from the 5.06 billion produced a year ago. The number of layers averaged 227 million, down 5 percent from a year ago.

Data for the 30 quarterly states were estimated based on the percent change in the 20 states making monthly surveys. These monthly states accounted for about 84 percent of the U.S. egg production and layer numbers in 1988.

MONTANA
POTATO STOCKS DOWN 5 PERCENT

Potato stocks on hand February 1 in **Montana** totaled 1.9 million cwt., 5 percent less than a year earlier. Stocks in storage represent 88 percent of the 1988 production.

Fall potato stocks totaled 145 million cwt on February 1, 1989, down 13 percent from a year ago and 6 percent below two years ago. Storage operators in the 15 major States reported 48 percent of fall production on hand this year compared with 50 percent last year. February 1 stocks are 84 percent russet, 14 percent white, and 2 percent red.

The six **Western States** stored 107 million cwt of potatoes on February 1, 1989, down 8 percent from last year and 1 percent below 1987. California stocks were down 36 percent from last year; Oregon, down 22 percent. Idaho and Montana were each off 5 percent from last year. Colorado stocks were down 12 percent and Washington was down 2 percent.

Disappearance from the start of harvest to February 1 totaled 155 million cwt, down 7 percent from last year but 1 percent above two years ago. Shrinkage and loss was 19.2 million cwt, down 6 percent from last year's 20.5 million cwt and 2 percent below the 19.6 million cwt lost from the 1986 crop. January disappearance of 26.9 million cwt was 7 percent below a year ago.

JANUARY
MILK PRODUCTION - 21 STATES

Milk production in the 21 selected States totaled 10.5 billion pounds, 3 percent above production in these same States in January 1988. Production per cow averaged 1,220 pounds for January, 43 pounds more than January 1988. The number of cows on farms was 8.58 million head, 5 thousand head above December 1988 but 90 thousand head below January 1988.

1988 HONEY PRODUCTION

Montana honey production for 1988 (for producers with 5 or more hives) was 5.04 million pounds, down 48 percent from 1987. The State's beekeepers had 105,000 producing colonies, up 11 percent from 1987. Average **yield** was 48 pounds compared with 102 pounds the year before. **Stocks** on hand December 15 were 151,000 pounds or 3.0 percent of production. The price received for the 1988 honey crop averaged 47 cents per pound.

U.S. honey production in 1988 totaled 212 million pounds, down 7 percent from 1987. There were 3.2 million colonies producing honey, down slightly from 1987. **Yield** per colony averaged 66.4 pounds, down from 71.1 pounds in 1987. Colonies that produced in more than one State were counted in each State, and yields may be understated. Producer honey **stocks** were 31.2 million pounds on December 15. Some States had excellent production while production in other States suffered from drought and disease.

SUPPLY and DEMAND

I often hear the comment, "We really don't need your statistics, why not let supply and demand determine the market?" Most people want free markets and believe in supply and demand.

When supply and demand is working properly, most would agree that the producer is receiving a fair price. When there is a surplus on the market, lower prices are called for to reduce production, when there is a shortage, higher prices signal producers to increase production. But, how are supplies measured? Who determines when there is a shortage or a surplus?

The person with the best information would have an advantage because he would have a good idea if there was a shortage or a surplus. That's why accurate statistics are important--especially to the producers. He normally doesn't have the resources to compile his own information as many buyers do--so he depends on others to provide the information he needs--statistical information that's vital for supply and demand to work properly and to return a fair price.

FORWARD CONTRACTING--KNOW THE LANGUAGE

Forward contract: An agreement between two parties (e.g., a farmer and an elevator) to deliver and make payment for a commodity at a future date. The quantity, price, grade, and place of delivery are set by the contract.

Renegotiation: A change from the original contract specifications on the quantity, price, grade, time, or place of delivery.

Hedging: Forward buying or selling in the futures market to protect against fluctuations of position held in the cash market. For example, at planting time a farmer can sell corn on the futures market to lock in a price. At harvest time, the corn can be sold for cash and the futures contract can be bought back. Losses or gains in one market are about offset by gains or losses in the other.

Margin call: A request from a brokerage firm to a customer for additional margin (funds set aside to ensure performance of the contract) when the customer's equity is diminished by a falling value of the contract.

CONSUMER DEMAND FOR MEAT CONTINUES STRONG

Because of strong consumer demand during the second half of last year, record quantities of meat and dairy products were marketed at generally higher prices. Continued growth in the economy will likely mean that prices will stay strong despite large supplies.

Pork production during the second half of 1988 was well above the previous year, pulling down hog prices. But prices for other livestock and dairy products are up despite large supplies.

U.S. livestock producers closed out 1988 with 1% less red meat produced in December versus the previous year.

DECEMBER MANUFACTURED DAIRY

Montana dairy plants produced 115,000 gallons of ice cream in December, up 21 percent from November and up 62 percent from December 1987. Creamed cottage cheese output, at 237,000 pounds was unchanged from last month, but was down 13 percent from last year. There were 163,000 pounds of lowfat cottage cheese produced, down 5 percent from last month. Butter production in December was 138,000 pounds, down 19 percent from November and down 12 percent from December 1987.

U.S. butter production was 111 million pounds, 2 percent above December 1987 and 21 percent above November 1988. Creamed cottage cheese production was 46.8 million pounds, 5 percent below both December 1987 and November 1988. Lowfat cottage cheese production was 20.5 million pounds, 10 percent above December 1987 but 7 percent below November 1988.

December ice cream production, at 54.9 million gallons was down 1 percent from last year. There were 2.99 million gallons of sherbet produced, down 6 percent from December 1987.

CATTLE ON FEED-13 QUARTERLY STATES

Cattle and calves on feed January 1, 1989, for slaughter market in the 13 quarterly States totaled 9.41 million head, down 4 percent from January 1, 1988 but 2 percent above 1987.

The cattle on feed inventory included 6.03 million steers and steer calves, 6 percent below last year but 1 percent above 1987. This group represented 64 percent of the total January number on feed, compared to 65 percent for both last year and 1987. Heifers and heifer calves accounted for 3.33 million, nearly the same as a year ago but up 3 percent from 1987.

Cattle on feed January 1, 1989, in the 7 monthly States totaled 7.77 million, 4 percent less than the previous year but 2 percent more than two years ago. Placements in feedlots during December totaled 1.40 million, 5 percent more than last year but 2 percent below 1986. Marketings during December totaled 1.52 million, down 3 percent from December 1987 but up fractionally from 1986. OTHER DISAPPEARANCE during December was 115 thousand head, 3 percent below last year but 11 percent above 1986.

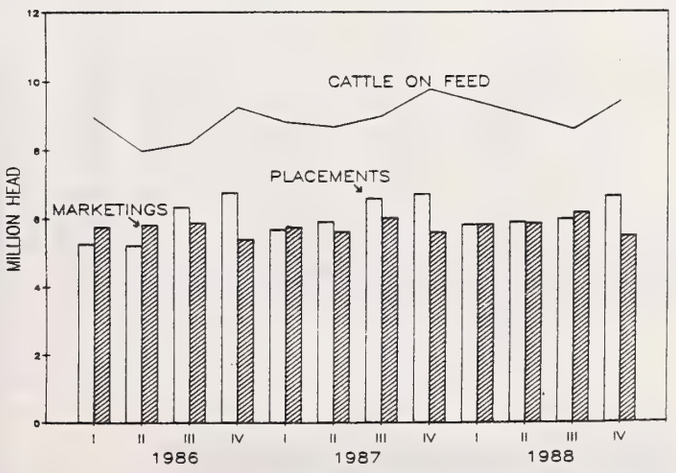
BY QUARTERS FOR 13 STATES



JANUARY PRICES RECEIVED

Montana farmers received mostly higher prices for the products they sold in January compared with a month earlier. Winter wheat and hay prices went up while durum, hard spring wheat, and barley prices declined. All livestock items except sheep and eggs increased in price.

The Montana prices received index in January for all farm products at 188 (1977=100) is 8 points above the December index. The all crops index at 176 is up 3 points, while the livestock and products index at 199 is up 12 points.

Nationally, the January all farm products index of prices received by farmers increased 2 points from December to 147 percent of its January-December 1977 average. Higher prices for cattle, hogs, tomatoes, and wheat were partially offset by lower prices for strawberries, grapefruit, peanuts, and oranges. The index was 16 points above a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes, and farm wage rates for January was 175 percent of its 1977 average. The index rose 2 points from October and 10 points from last year. Higher feeder pig and feeder cattle and calf prices accounted for most of the index increase since October.

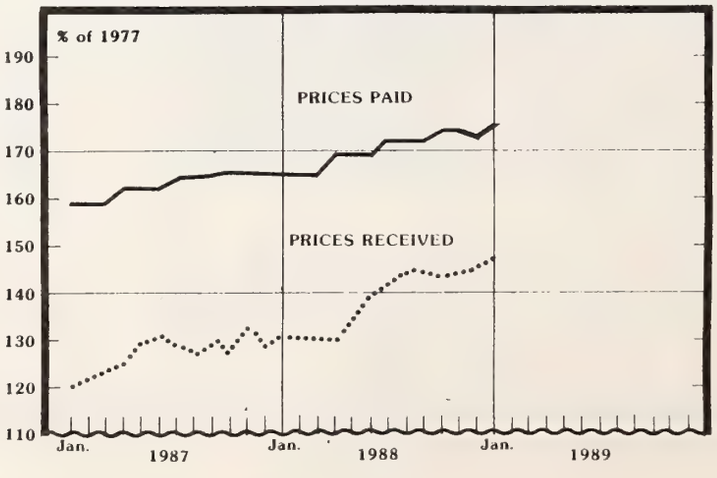
UNITED STATES INDEX NUMBERS OF PRICES PAID & PRICES RECEIVED



JANUARY 1 INVENTORY OF CATTLE & CALVES

MONTANA'S January 1, 1989 inventory of **Cattle and Calves**, at 2350 thousand head was unchanged from the previous year. Highlights of this year's report were:

-- This year's inventory was the lowest since 1963 and was 25 percent below the 1984 count.
-- Beef cow numbers on January 1 at 1.3 million were up 4 percent while beef cow replacement heifers at 296 thousand were up 16 percent. Incentive for expansion was supported by calf prices in excess of $90 for 8 of 12 months in 1988.
-- Carryover calves at 242 thousand head were down a sharp 21 percent as a result of strong prices and a shortage of feed.
-- The 1988 calf crop totaled 1350 thousand head, up 5 percent from 1987 but 2 percent below 1986.

UNITED STATES cattle and calf numbers totaled 99.5 million head as of January 1, 1989, down slightly from a year earlier, but 2 percent below two years ago. Highlights of this year's report were:

-- The 1989 inventory count marked the seventh consecutive year of lower cattle and calf numbers and has reached the lowest level since 1961.
-- This year's inventory was a sharp 25 percent below the record high inventory of 132 million head reported in 1975.
-- Beef cows at 33.7 million head were up 2 percent while beef cow replacement heifers totaled 5.5 million, up 5 percent.
-- The U.S. calf crop at 40.9 million head born during 1988 was up 2 percent from 1987.

JANUARY 1 SHEEP & LAMB INVENTORY

There were 568,000 **sheep and lambs** on hand in **Montana** on January 1, 1989, 7 percent more than last year. Montana highlights are:

--Largest sheep and lamb inventory since the 600 thousand in 1983.
--Lamb crop up 5 percent from last year.
--Average value declined to $89 per head, down $10 from last year's record high value.
--Ewes 1 year old and older are up 8 percent from 1987 to 410 thousand head--largest inventory since 1984.
--Ewe lambs, at 105 thousand, are down 1 percent from 1988 and 1987 but are well above number held from 1983 to 1986.

All sheep and lambs in the **U.S.** inventory totaled 10.8 million head, just slightly more than 1988's inventory and the third straight increase since the smallest inventory of record in 1986. Other U.S. highlights are:

--The nation's lamb crop, at 7.12 million head, is down 1 percent from 1987 and is the smallest on record.
--The national value of sheep and lambs on hand was $890 million, down 8 percent from 1987.
--The average value per head in the U.S. was $82.40, down 8 percent from last year's record high value of $90.00.

OCTOBER-DECEMBER MILK PRODUCTION UP 4 PERCENT

Montana's October-December milk production at 87 million pounds, was 4 percent higher than last year. Average milk production per cow, increased nearly 4 percent to 3480 pounds. The number of milk cows held steady at 25,000 head. Montana's dairymen fed an average of 15.0 pounds of grain and concentrates per head per day, down 0.5 pound from last year. The cost per hundredweight of this feed was $7.50, up $1.30 from a year ago.

The quarterly production of milk **for the U.S.** was 35.4 billion pounds, 2 percent above October-December 1987. The average number of cows in the U.S. during the October-December quarter was 10.2 million head, 1 percent below October-December 1987.

Grain and other concentrates fed to milk cows averaged 17.1 pounds, 0.1 pound less than last year. The value of grain and other concentrates fed to cows averaged $8.40 per hundredweight, $1.47 per hundredweight more than the January 1, 1988 value.

DECEMBER RED MEAT PRODUCTION

Montana slaughter plants produced 1.2 million pounds of red meat in December 1988. This production is down 10 percent from last month, and down 20 percent from the December 1987 production.

The number of cattle slaughtered, at 1,400 head, was down 400 head from a year earlier. The average liveweight of cattle slaughtered was 1,038 pounds compared with 1,075 pounds in December 1987. Hog slaughter, at 2,400 head was down 200 head from last year. The average liveweight of hogs slaughtered was 238 pounds, virtually unchanged from a year ago.

Commercial red meat production for the United States in December 1988 totaled 3.36 billion pounds down 1 percent from December 1987. January-December red meat production, at 39.8 billion pounds was up 3 percent from last year. The percentage changes from 1987 accumulated production by individual components were: Beef, unchanged; Veal, down 7; Pork, up 9; Lamb and Mutton, up 6. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

POTATO STOCKS DOWN 7 PERCENT

Montana potato growers had 1.95 million cwt of potatoes in storage on January 1, 1989 or 90 percent of last year's production. The January 1 stocks level is 7 percent less than a year ago.

For all the fall producing states, there were 171.56 million cwt on hand on January 1, 57 percent of production and 12 percent under a year ago.

CROP SEASON REVIEW

Montana's growing season was dominated by a severe statewide drought. The dry season started early in the spring and although rains from 3/4 to 1 1/2 inches fell during June they were not enough to override the effects of a very dry July and August. Small grains matured ahead of schedule on very short straw and mostly thin stands.

Ranges and pastures made little or no growth during the entire season in most of Montana. Many herds were culled or relocated early in the season and hay prices soared. Calves were weaned and marketed ahead of schedule. Rains in September started grass and weed growth in grain stubble, and softened range grasses.

The lack of mountain snowpack resulted in far below normal streamflow. Forests were very dry and the fire season was one of the worst in the history of the State.

Soils were still dry for winter wheat seeding but many farmers went ahead anyway. Rain at the end of September germinated much of the crop and pushed seeding ahead for those who were waiting. The winter wheat crop entered dormancy in fair to good condition. Wind damage to the crop during the early winter months has been light.

1989 WINTER WHEAT ACREAGE DOWN 2 PERCENT

Montana farmers planted 2.4 million acres of winter wheat last fall for harvest in 1989. This is 2 percent less than last year, and 5 percent less than the 10 year average. Winter wheat plantings have been on a slow, but erratic, decline in Montana for several years.

Planting conditions last fall started out very dry, but fall rains established fair to good stands. Although soil moisture is still short, the crop is mostly under good snow cover protection.

The U.S. winter wheat seeded area for 1989 is placed at 54.5 million acres, up 12 percent from 1988. All states increased acreage from 1988 except Arizona, the Dakotas, Mississippi, Montana, Nevada, New Jersey, and Wyoming. New Mexico and Tennessee are unchanged.

Seeding of this year's crop kicked off in August in several states. Nearly 2 percent of the crop was seeded by September 1. Progress moved along by varying degrees, reaching about 97 percent as of December 1. By Mid-December, seeding was finished except for parts of the Southeast, Arizona, and California.

EGG PRODUCTION DOWN 5 PERCENT

There were 194 million eggs produced in Montana during the year ending November 30, 1988. Layer numbers during 1988 averaged 773,000 compared with 789,000 a year earlier. The annual average production per layer on hand in 1988 was 251 eggs, down from 260 eggs per layer in 1987.

There were 910,000 chickens on Montana farms December 1, 1988 compared with 990,000 chickens on hand a year earlier. The inventory value was $2,093,000, down from $2,426,000 on December 1, 1987.

U.S. egg production during 1988 totaled 69.5 billion eggs, unchanged from a year earlier. Layer numbers during 1988 averaged 277 million, down 1 percent from 1987. The annual average production per layer on hand in 1988 was 251 eggs, up from 248 eggs in 1987.

The inventory number of all chickens on December 1, 1988 (excluding broilers) totaled 355 million, down 6 percent from a year ago. The total value was $725.0 million, up from $706.1 million on December 1, 1987

NOVEMBER MANUFACTURED DAIRY

Montana dairy plants produced 95,000 gallons of ice cream in November, up 13 percent from October and up 27 percent from November 1987. Creamed cottage cheese output, at 236,000 pounds was down 5 percent from last month and down 15 percent from last year. There were 171,000 pounds of lowfat cottage cheese produced in November, down 6 percent from last month. Butter production in November was 170,000 pounds, up 33 percent from October and up 21 percent from November 1987.

U.S. butter production was 92.2 million pounds, 5 percent above November 1987 but the same as October 1988. Creamed cottage cheese production was 49.1 million pounds, 4 percent below November 1987, but 1 percent below October 1988. Lowfat cottage cheese production was 22.0 million pounds, 12 percent above November 1987 but 1 percent below October 1988.

November ice cream production, at 57.8 million gallons was up 1 percent from last year. There were 2.80 million gallons of sherbet produced, up 6 percent from November 1987.

EGG PRODUCTION DOWN 12 PERCENT

There were 43 million eggs produced by **Montana** laying flocks during the September-November quarter, 12 percent less than produced during the same quarter in 1987. The average number of **layers** on hand during the quarter was 725,000 layers compared with 783,000 layers on hand a year earlier. **Rate of lay** during the September-November quarter averaged 59.3 eggs per hundred layers, down from 62.6 during this quarter in 1987.

The **Nation's** laying flocks produced 17.0 billion eggs during the September through November quarter, down 2 percent from the corresponding quarter a year ago. Production included 15.0 billion for table eggs and 2.03 billion for hatching eggs. Layers for the quarter averaged 274 million, down 3 percent from the 283 million a year ago.

All layers in the U.S. on December 1, 1988 totaled 275 million, compared with 286 million a year ago. The 275 million layers consisted of 237 million table or commercial type eggs and 38.1 million hatching type eggs. Rate of lay per day on December 1, 1988 averaged 68.8 eggs per 100 layers compared with 68.5 for December 1, 1987 and 68.9 on November 1, 1988.

Laying flocks in the 20 major egg production States produced 4.76 billion eggs during November, down 2 percent from the 4.87 billion produced a year ago. The number of layers during November averaged 230 million, down 3 percent from a year ago.

DECEMBER HOG & PIG INVENTORY UP 7 PERCENT

The inventory of hogs and pigs in Montana on December 1, 1988, was estimated at 245,000 head, up 7 percent from a year ago. The December inventory is the largest since 250,000 were on hand in 1980. Market hogs, estimated at 213,000 head, and breeding hogs at 32,000 head are both up 7 percent from last year.

There were 24,000 sows that farrowed from December 1987 through May 1988, producing a pig crop of 184,000 head. Sows farrowing from June through November 1988 at 31,000 head, produced a pig crop of 217,000 head. The total pig crop for the year, at 401,000 head is 12 percent above last year. There are approximately 2,000 farms with hogs in Montana. The value of Montana's hog inventory is estimated at $17.6 million compared with $16.8 million a year earlier.

U.S. inventory of all hogs and pigs was estimated at 55.3 million head on December 1, 1988. This was 1 percent above a year ago and 9 percent above December 1, 1986.

-- Breeding hog inventory, at 7.04 million, was 2 percent below last year but 6 percent above two years ago.

-- Market hog inventory, at 48.3 million, was 2 percent above a year ago and 9 percent above two years ago.

NOVEMBER RED MEAT PRODUCTION

Montana slaughter plants produced 1.3 million pounds of red meat in November 1988. This production is down 7 percent from last month, and down 13 percent from the November 1987 production.

The number of cattle slaughtered, at 1,600 head, was down 200 head from a year earlier. The average liveweight slaughtered was 1005 pounds compared with 1,063 pounds in November 1987. Hog slaughter, at 2,700 head was up 200 head from last year. The average liveweight of hogs slaughtered was 231 pounds, down 10 pounds from November 1987.

Commercial red meat production for the **United States** in November 1988 totaled 3.40 billion pounds, up 6 percent from last year. January-November red meat production, at 36.4 billion pounds was up 4 percent from last year. The percentage changes from 1987 accumulated production by individual components were: Beef, unchanged; Veal, down 7; Pork, up 10; Lamb and Mutton, up 6. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

The 10 Quarterly States, with 43.0 million head on December 1, 1988, were up slightly from a year earlier and up 8 percent from December 1, 1986. These 10 States account for approximately 78 percent of the total U.S. hog and pig inventory.

1988 Pig Crop: The U.S. pig crop for 1988 totaled 92.6 million head, 5 percent above 1987 and 12 percent above the 1986 pig crop.

-- December 1987-May 1988 pig crop, estimated at 46.8 million head, was up 8 percent from a year earlier and 16 percent above the comparable period in 1986.

-- June-November 1988 pig crop, estimated at 45.7 million head, was 2 percent above last year, and 9 percent above the June-November 1986 pig crop.

A total of 6.00 million sows farrowed during June-November 1988, 3 percent above a year earlier and 11 percent above the June-November 1986 period. The litter size during this period averaged 7.62, compared to the record 7.74 in both 1987 and 1986.

In the 10 Quarterly States, the June-August 1988 pig crop totaled 18.0 million head, 2 percent above the same quarter a year earlier. For the September-November period, the pig crop of 17.2 million head was 2 percent below the same period in 1987.

DECEMBER AG PRICES

Montana farmers and ranchers received slightly lower prices for most of the products they sold in December compared with a month earlier. Lower prices were noted for wheat, barley, steers and heifers, cows and calves. Prices increased for oats, sheep, lambs, hogs, milk and eggs.

The December index of all farm products at 174 (1977=100) was down 6 points from November but still 24 points above a year ago. The all crops index at 169 is down 4 points from November, while the livestock and products index at 179 is down 7 points.

For the nation, the December all farm products index of prices received by farmers increased 1 point from November to 145 percent of its January-December average. Higher prices for hogs, lettuce, oranges, and cattle were partially offset by lower prices for tomatoes, turkeys, sweet corn, and strawberries. The index was 18 points above a year ago.

Hog prices increased substantially from last month's relatively low levels while cattle, milk, broiler, and egg prices each increased slightly. The all wheat price was at the highest level since May of 1981. Soybean and corn prices increased slightly since November. Tomato and turkey prices decreased sharply from last month.

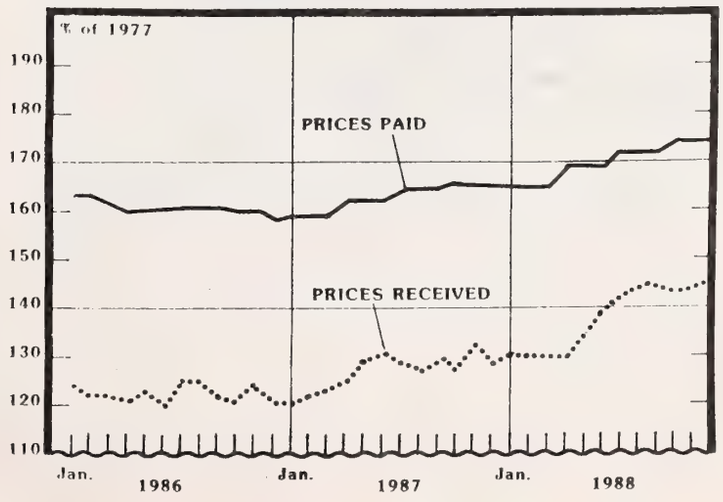
UNITED STATES INDEX NUMBERS OF PRICES PAID & PRICES RECEIVED



HAY STOCKS DOWN 56 PERCENT

Stocks of hay on hand in **Montana** on December 1, 1988, totaled 2.71 million tons, 56 percent less than last year. The low hay stocks level is a combination of low production and above normal feed requirement brought on by drought. Although this year's stocks are drastically below the levels of 1986 and 1987, they are still 27 percent more than the December 1, 1985 hay stocks on hand.

Livestock were able to graze crop residue and hay fields during most of the fall. However, supplemental feeding of hay was also widely practiced during that period.

U.S. hay stocks on farms totaled 90.9 million tons on December 1, 1988. This was 24 percent less than on hand a year earlier and 25 percent below the holdings on December 1, 1986. The lower stocks this year reflect the effect of drought last summer.

1989 WINTER WHEAT CONDITION

Lack of moisture stressed winter wheat in the Central and Southern Plains during December. At mid-month, some reseeding occurred in Texas.

Greenbug infestation was a continuing problem. By the end of the month, greenbugs were a problem as far north as Nebraska. Moisture improved conditions in eastern Kansas and the Texas Blacklands late in December.

Early in the month, producers were concerned about lack of snow cover in the Norther Plains and the Corn Belt. By month's end, snow cover was improved but still limited in some areas. Despite limited snow cover in Colorado and Montana, wind damage was light.

Russian wheat aphids were a problem in Oregon and Washington during most of the month. Storms slowed seeding in California during the latter half of December. Winter wheat was mostly good to fair in the Southeast. Seeding was nearly complete by month's end.

INTEREST HIGH IN CATTLE NUMBERS

Will Montana cattle numbers decline in 1989 for the fifth consecutive year? That's a question asked by many involved in Montana's cattle business. The January 1, 1988 figures pegged Montana's herd at 2,350 thousand head -- the lowest count since 1963. Heifers kept for beef cow replacement were up 9% last year indicating intentions to rebuild herds that had been liquidated due to financial stress and a shortage of hay and pasture.

Many experts expect a further decline in numbers. A look at Montana auction market data shows sales of cattle through November 1988 were up 15 percent from the same period a year ago. Although auction market sales only represent about half of total Montana marketings, indications point toward a possible further shrinkage of the herd size.

During the first two weeks in January, about 1,500 ranchers will be contacted by mail, phone, or personal interview to determine Montana cattle numbers as of January 1, 1989. The cooperation of those selected will be sincerely appreciated. Results will be published on February 8th. Most analysts agree that prices should remain strong during 1989, signaling producers to expand. But, expansion in Montana will depend on moisture supplies.

CATTLE ON FEED IN 7 STATES DOWN 5 PERCENT FROM LAST YEAR

Cattle and calves on feed December 1, 1988, for slaughter market in the 7 States preparing monthly estimates totaled 7.98 million head, down 5 percent from a year ago but up 2 percent from December 1, 1986.

MARKETINGS of fed cattle during November totaled 1.51 million, up 3 percent from last year and up 4 percent from two years ago. This is the largest number of marketings during November since 1978.

PLACEMENTS of cattle and calves on feed in the 7 States during November totaled 1.68 million, up 4 percent from last year but down 8 percent from November 1986. **NET PLACEMENTS** of 1.57 million for November are 4 percent above last year but 9 percent below 1986.

OTHER DISAPPEARANCE totaled 107 thousand head, compared to 103 thousand during November 1987 and 87 thousand during November 1986.

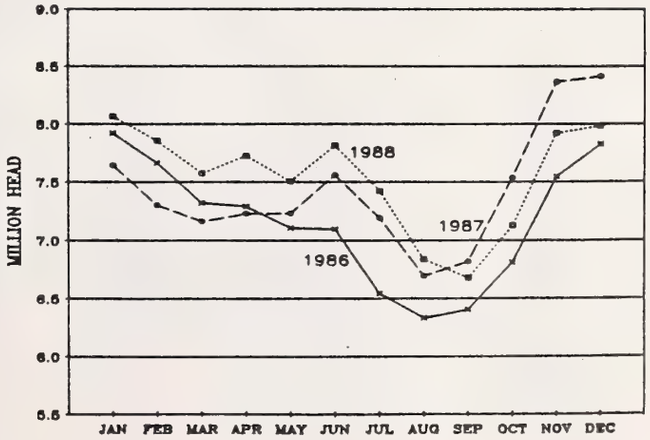
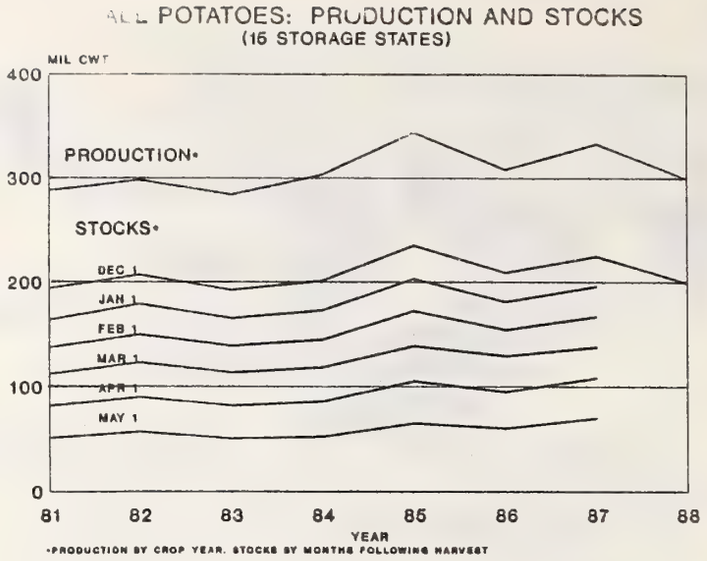
CATTLE ON FEED
7 STATES



POTATO STOCKS DOWN 12 PERCENT



Montana potato producers have 2,020,000 cwt of potatoes in storage as of December 1, compared with 2,200,000 cwt on hand December 1, 1987. The December 1 stocks represent 94% of the 2,156,000 cwt produced this year, while last year's stocks represented 93% of 1987 production. Nearly all of Montana's potatoes in storage will be sold for seed next spring.

Fall potato stocks in the **15 major storage states** were estimated at 199 million cwt on December 1, 1988. This is a drop of 12 percent from last year and 5 percent below 1986 storage. Farmers and storage operators accounted for 66 percent of fall production under cover this year, compared with 67 percent last year. Potato stocks by type were 2 percent **red**, 16 percent **white**, and 82 percent **russet**.

Fall potato production is estimated at 307 million cwt, down 10 percent from last year and 3 percent below 1986. Area harvested is set at 1.06 million acres, down 2 percent from last year but 2 percent above 1986. The average yield was finalized at 290 cwt per acre, 8 percent short of a year ago and 6 percent below 1986. The December 1 estimate of production is nearly 1 percent below the November 1 forecast, based on an adjustment in acreage and a downward change in yield per acre.

Nine western states produced 215 million cwt of potatoes in 1986, down 6 percent from last year but 3 percent above 1986. Acreage harvested is set at 607 thousand acres, a dip of 2 percent from last year but 5 percent above 1986. The average yield of 353 cwt was 4 percent below last year. Idaho production is down fractionally from last year as increased acreage nearly offset lower average yields.

The Colorado crop turned out 5 percent smaller than last year and smaller than forecast on November 1. A water shortage in Malheur County and spring frost in Klamath Falls coupled with an 18 percent drop in acres to reduce Oregon production 20 percent from last year. Washington production dipped 6 percent; while California output dropped 22 percent.

HAPPY NEW YEAR !

GRAIN STOCKS SHARPLY LOWER

The 1988 drought brought about the steepest one-year decline in world grain stocks ever recorded. Just 2 years ago, global stocks of grain were record high. In the U.S. alone, grains stocks totaled 204 million tons, enough to satisfy our domestic needs for almost a full year. Stocks will be drawn down by a staggering 100 million tons this marketing year -- and by 135 million tons in a two-year period, with stocks in other countries declining an estimated 53 million tons.

* The specter of global food scarcity has reared its head once again, but history does not support this pessimistic view. During the past 30 years, U.S. grain yields have increased steadily -- averaging 2 bushels per acre per year for corn; a half-bushel for wheat; and about one-third of a bushel for soybeans.

* Many countries have yet to adopt existing technology. Only one-third of the corn area in developing countries is planted to hybrid corn varieties, yet those countries account for fully one-half of the world's corn area.

* There is little reason to believe that the pace of technological improvement in agriculture will slow. If anything, dramatic breakthroughs are on the horizon. Within the next few years, biotechnology will move from the laboratory into commercial use, potentially offering new plant varieties resistant to insects, heat, drought, frost, and disease.

* Since 1950 whenever crop yields have dropped more than 15% for whatever reason, production rebounded the following year. Corn rebounded an average of 42%, soybean production, 17%; and wheat 20%. Data for the past 20 years show that corn, soybean, and wheat yields recovered to within 10% of trend --either higher or lower--in the years following a drought. Fundamentals may have been masked by the 1988 drought, but they have not changed. The drought has altered the immediate outlook, but in a world of subsidized agriculture, the long-term tendency to overproduce lurks only slightly below the surface. USDA Assistant Secretary Ewen M. Wilson.

CONSUMERS ARE CHANGING

In 1960 two-income families represented 26% of all families; but today, 44%. Between 1976 and 1987 the traditional family with children where only the husband is employed dropped 25% and now make up about 28% of all families in which the wife is 18 to 44 years old. Dual income families with no kids increased 31% between 1976 and 1987. Dual income families with children increased 61% between 1976 and 1987. It is estimated that by the year 2000 more than 60% of the workforce will be female.

* For many consumers, time is viewed as a more limiting resource than money. About 66% of all households have microwaves, and 43 million servings of food and beverages are heated in microwaves daily. Several years ago, research revealed that 30 minutes appeared to be the maximum time many "active lifestyle" consumers were willing to spend preparing a weekday meal at home. Recently, consumer watchers believe this magic number has diminished to 20 or even 10 minutes.

* Consumers generally desire higher quality foods. Among society-at-large, skills, understanding and experience with cooking and the creation of high quality foods is diminishing. This suggests that future sources of high quality foods will increasingly be food marketers rather than consumers' kitchens.

* Value-driven consumers typically will pay more for products and services that deliver on the promise of better quality. Since quality is such a broad concept with many interpretations among consumers, it follows that food marketers, from farmers to retailers, must respond.

* Growing numbers of people consider foods, diets, and lifestyles more seriously in terms of preventing health problems and prolonging healthful and active lives. -- John W. Allen and Thomas R. Pierson, professors of Agricultural Economics, Michigan State University.

28 MILLION ACRES EXPECTED IN CRP

The Food Security Act of 1985 has been called the most significant conservation legislation since the 1930's. After the 6th signup last spring, more than 25,5 million acres were enrolled under 10-year contracts.

When bids accepted for the 7th signup are announced in mid-December, we expect to have about 28 million acres enrolled in the program. Placing the 25.5 million acres in permanent cover will mean an estimated soil savings of more than 530 million tons annually as average rates of erosion decline from 22.4 tons per acre per year to 1.6 tons.

Producers are devoting nearly 22 million acres to grasses and more than 1.5 million acres to trees. Participants are also encouraged to install needed diversion, windbreaks, waterways, wildlife plantings, and other conservation practices.

NOVEMBER MILK PRODUCTION - 21 STATES

Milk production in the 21 selected States totaled 9.79 billion pounds. This was 2 percent above production for November 1987 in these same States.

During the July-September period, the 21 selected States produced 85.1 percent of the U.S. production. If producers in the remaining 29 States not surveyed for December 1, followed the trend shown by the reporting States, the U.S. milk production would total about 11.5 billion pounds for November.

Production per cow in the 21 selected States averaged 1,142 pounds during November, 35 pounds above November 1987. Total milk cows in the 21 States averaged 8.57 million head, 1 percent less than November 1987 and 11,000 head less than October 1988.

Seasons Greetings

The Holiday Season is upon us. It's time to pause, reflect and evaluate our objectives. It brings to mind words from our NASS administrator, Charles Caudill. He said, "Keep your priorities straight! Those priorities should be: God, family, and job -- in that order." This message was a bit unexpected from a man whose agency is facing increased responsibilities with a very tight budget, but in the overall scheme of things it makes sense.

A lifetime is often too short for most of us to leave a mark for future generations, except through our deeds. If we conduct our lives with a commitment to God, our families and set high standards both on and off our jobs, we can make a difference!

During this holiday season we should remember that many are struggling to survive and need encouragement and help. We are indeed fortunate that even during this year of extensive drought, we still have an abundance of food. We salute our farmers and ranchers who struggled to produce in the face of adversity.

On behalf of our office staff, we want to thank you for your support throughout the year and wish each of you a Merry Christmas and a Happy New Year!

DEMAND UP FOR FRUITS AND VEGETABLES

Fresh fruits and vegetables are becoming more important to consumers. That's why more space is being allocated to fresh produce in America's supermarkets.

An expanded variety of products is available with rapid increases in lettuce and other greens, melons, and chili peppers. In addition, demand has rapidly increased for organically grown produce. What do we mean by organic? Those are fruits and vegetables grown without commercial fertilizer or pesticides. They demand a price premium because of the additional work and care required to grow organic products, and, of course, the additional marketing costs.

The biggest challenge that supermarkets face is keeping organic produce separate and promoting the organic product without implying that the regular, cheaper produce is any less desirable.

U.S. HAS HUGE CROPLAND RESERVE

The United States has the best cropland resource of any country in the world - a little over 400 million fertile acres.

Cropland is one of the major forces that give American farmers their great power to produce. And, of course, overproduction is still the major underlying cause of much of agriculture's problems. In an effort to control overproduction, a lot of land has been idled the last couple of years.

In 1981, just 7 years ago, almost 90% of all cropland was actually harvested. In 1988 only 70% of our 406 million cropland acres was used. Crop failure was partly responsible but the main cause was land idled under government programs. This was nearly 20% of our total cropland. It would be a lot more if it wasn't for exports. In 1987, the last year figures were available, 36% of all harvested acres in the United States were producing for export.

So, in order to provide enough food for just our nation, less than half of our total cropland would be necessary. No wonder American agriculture contributes so much to our national prosperity.

OCTOBER MANUFACTURED DAIRY

Montana dairy plants produced 84,000 gallons of ice cream in October, down 18 percent from September and down 13 percent from October 1987. Creamed cottage cheese output, at 249,000 pounds was down 2 percent from last month and down 10 percent from last year. There were 181,000 pounds of lowfat cottage cheese produced, down 11 percent from last month. Butter production in October was 128,000 pounds, up 22 percent from September, but down 6 percent from October 1987.

U.S. butter production was 92.2 million pounds, 1 percent above October 1987 and 11 percent above September 1988. Creamed cottage cheese production was 50.5 million pounds, 7 percent below October 1987 and 4 percent below September 1988. Lowfat cottage cheese production was 22.3 million pounds, virtually unchanged from October 1987, but 7 percent below September 1988.

October ice cream production, at 62.6 million gallons was down 1 percent from last year. There were 3.47 million gallons of sherbet produced, up 19 percent from October 1987.

1988 BULLETIN NOW AVAILABLE

The 1988 Montana Agricultural Statistics bulletin is now available for distribution. It contains a statistical record of Montana's agriculture. The primary purpose of the bulletin is to provide those interested in Montana's agricultural industry with a single publication that covers state and county crop and livestock production.

It also features farm income, numbers of farms and weather data, along with production statistics for the past ten years. The demand for accurate, reliable statistical data continues to grow.

Farm programs and the marketing system depend on information for fair prices and equitable programs. Agri-businesses want to know about Montana agriculture before investing in our state!

For more information about obtaining a copy of this year's bulletin call or write to the Montana Agricultural Statistics Service at (406) 449-5303, P.O. Box 4369, Helena, MT 59604. The bulletin is free to those who report information to us, but costs $5.00 for others, payable to the Montana Department of Agriculture at the above address.

NOVEMBER PRICES RECEIVED

The November 1988 Index of Prices Received by Montana farmers and ranchers at 181 percent of the 1977 average, declined 4 points from October but was still 30 points above November last year.

The crops index edged up 1 point, while livestock dropped off 7 points. Compared with last year, the crops index is up 54 points and the livestock index is up 8 points.

Individual commodity price changes between October and November were mixed, with declines for durum wheat, barley, steers, heifers, cows, and calves. Hay and wool were unchanged, other items were up.

Compared with last year, most items were up except for cows, sheep, lambs, and hogs.

The November all farm products index of prices received by U.S. farmers decreased 1 point from October to 142 percent of its January-December 1977 average. Lower prices for hogs, corn, grapefruit, and soybeans were partially offset by higher prices for tomatoes, potatoes, milk, and sweet corn. The index was 10 points above a year ago.

All feed grain prices declined from the previous month. Wheat prices averaged the highest since May 1981 and dry bean prices were the highest since July 1981. Beef cattle prices held steady compared to October. Hog prices were at the lowest level since June 1980.

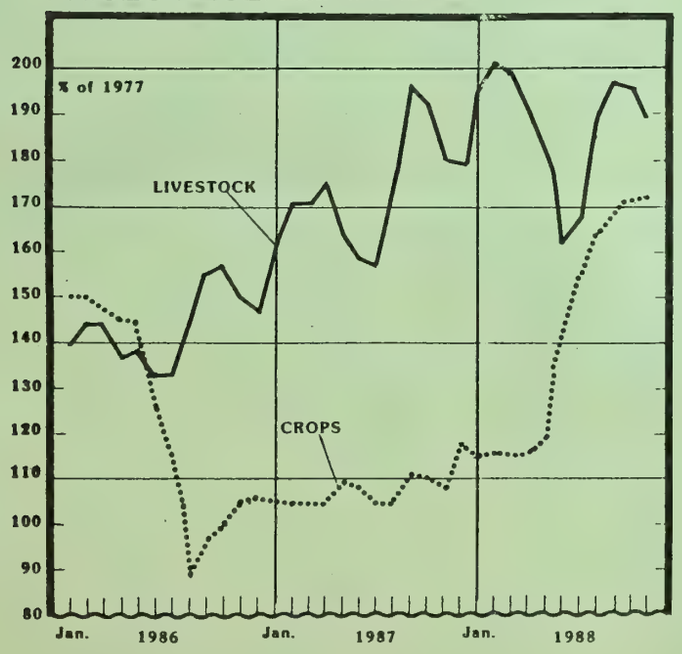
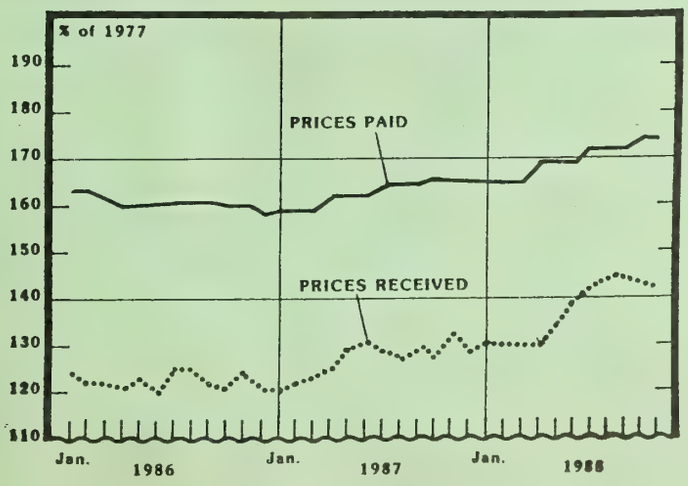
MONTANA CROP & LIVESTOCK PRICES RECEIVED INDEXES



UNITED STATES INDEX NUMBERS OF PRICES PAID & PRICES RECEIVED



CASH INCOME UP DESPITE DROUGHT

Despite the drought, net cash income for the farm sector in 1988 will be near or slightly above last year's record $57.1 billion. Reasons include higher prices, inventory drawdowns, and only moderate decreases in Government payments. However, the fortunes of individual farmers have changed sharply, some gaining from higher prices received and others losing from heavy crop losses or higher feed costs.

Production of red meat and poultry is setting a record this year, helped by greater slaughter in response to higher feed costs. Production is led by a 9-percent increase in pork. Turkeys, broilers, and milk are up moderately; beef and eggs are down. Next year, with reduced breeding stock and downward pressure on producer returns, production of red meat and poultry will be down about 1 percent.

U.S. crop production is off 18 percent this year. Most of the drop is in feed grains, which are down one-third. One measure of the drought's impact is the severe drawdown of U.S. grain and oil-seed inventories. Despite acreage and yield increases likely next year, most production for 1989/90 will be consumed directly in the U.S. and abroad, not put into stocks.

Cattle on Feed

U.S. EXPORTS RISE

U.S. farm exports likely grew $6 billion in value to $34 billion in the fiscal year ending September 30. Volume grew 17 million tons to 146 million, as the United States captured a larger share of growing world markets. In fiscal 1989, export volume may decline because of increased competition and stronger prices. However, with higher prices and with continued growth anticipated in high-value products, next year;s export value likely will rise further.

OUTLOOK FOR 1989 OPTIMISTIC

The annual agricultural outlook conference was held by USDA on November 29. This was a meeting of the experts who evaluated the supply and demand for agricultural products for 1989. The outlook predicted smaller crop supplies, firm demand and continued higher prices.

The 1988 drought cut supplies of U.S. grains by about one-third. If weather conditions improve next year, U.S. production should recover. Grain stocks at the end of May will represent less than 3 months of use. This is the lowest supply level since the mid-1970's.

The livestock outlook calls for a reduction in total meat production -- mostly from less beef. Cattle numbers are expected to be down again in 1989 and prices are expected to continue strong. Overall, not a bad outlook for Montana producers -- providing we receive sufficient moisture next year.

October Red Meat Production
Cattle on Feed in 7 States
Farm Labor
Milk Production
Egg Production
Malting Barley Survey Results
U.S. Food & Fiber System

CATTLE ON FEED IN 7 STATES DOWN 5 PERCENT FROM LAST YEAR

Cattle and calves on feed November 1 1988 for slaughter market in the 7 States preparing monthly estimates totaled 7.92 million head, down 5 percent from a year ago but up 5 percent from November 1, 1986.

MARKETINGS of fed cattle during October totaled 1.60 million, down 5 percent from last year but up 1 percent from two years ago.

PLACEMENTS of cattle and calves on feed in the 7 States during October totaled 2.48 million, down 5 percent from last year but up 3 percent from October 1986. **NET PLACEMENTS** of 2.39 million for October are 5 percent below last year but 3 percent above 1986.

OTHER DISAPPEARANCE totaled 84 thousand head, compared to 85 thousand during October 1987 and 81 thousand during October 1986.

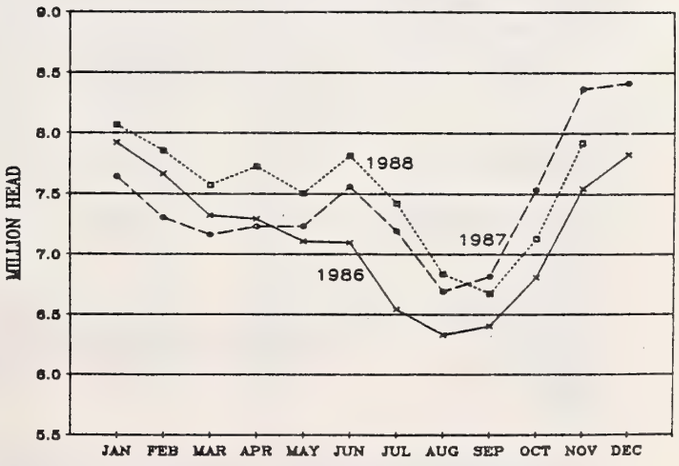
OCTOBER RED MEAT PRODUCTION UP 2 PERCENT

Montana slaughter plants produced 1.4 million pounds of red meat in October 1988. This production is up 2 percent from last month, but down 13 percent from the October 1987 production.

The number of cattle slaughtered, at 1,600 head, was down 500 head from a year earlier. The average liveweight slaughtered was 971 pounds compared with 1,056 pounds in October 1987. Hog slaughter, at 3,000 head was up 600 head from last year. The average liveweight of hogs slaughtered was 243 pounds, up 10 pounds from October 1987.

Commercial red meat production for the **United States** in October 1988 totaled 3.51 billion pounds, nearly the same as last year. January-October red meat production, at 33.0 billion pounds was up 4 percent from last year. The percentage changes from 1987 accumulated production by individual components were: Beef, unchanged; Veal, down 7; Pork, up 10; Lamb and Mutton, up 6. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

CATTLE ON FEED
7 STATES



OCTOBER MILK PRODUCTION UP 2 PERCENT

Milk production in the 21 selected States totaled 10.1 billion pounds. This was 2 percent more than production in these same States for October 1987.

During the July-September period, the 21 selected States produced 85.1 percent of the U.S. production. If producers in the remaining 29 States not surveyed for November 1, followed the trend shown by the reporting States, the U.S. milk production would total about 11.9 billion pounds for October.

Production per cow in the 21 selected States averaged 1,179 pounds during October, 31 pounds above October 1987.

Total milk cows in the 21 States averaged 8.58 million head, 1 percent less than October 1987 and 3,000 head below September 1988.

NUMBER OF WORKERS and WAGE RATES INCREASE

A total of 3.19 million persons worked on the Nation's farms and ranches during the week of October 9-15, 1988. This number compares with 3.07 million workers during the comparable week in 1987. The work force was comprised of 1.41 million self-employed farm operators, 532,000 unpaid workers, and 976,000 workers hired directly by farm operators. Rounding out the total were 274,000 agricultural service employees doing work on farms and ranches during the survey week.

The all hired farm worker wage rate for the October 1988 survey week averaged $5.18 per hour, up 26 cents from a year earlier. Workers paid on an hourly basis earned $4.94 per hour compared with $4.72 last October. Wage rates for field and livestock workers were $4.95 and $4.70, respectively. During October 1987, field workers made $4.80 while livestock workers earned $4.27.

During the current survey week, self-employed persons worked an average of 44.4 hours, 2.2 fewer hours than in the comparable week in 1987. Unpaid workers, who worked 15 hours or more during the week, put in 36.8 hours compared with 37.3 hours a year earlier. Hired workers spent an average of 41.9 hours doing agricultural work, up 1.4 hours from October of last year.

Perquisites, such as housing and meals, were provided to 44 percent of the hired workers. Housing was furnished to 16 percent of the workers, compared with 13 percent a year ago.

NATION'S EGG PRODUCTION DOWN 2 PERCENT

U.S. egg production totaled 5.83 billion during October 1988, down 2 percent from the 5.93 billion produced a year ago. Production included 5.15 billion for table eggs and 684 million for hatching eggs. The total number of layers during October averaged 275 million, down 3 percent from the 283 million a year ago. October egg production per 100 layers was 2,118 eggs, compared with 2,098 in October 1987.

All layers in the U.S. on November 1, 1988, totaled 276 million, compared with 283 million a year ago. The 276 million layers consisted of 240 million for table or commercial type eggs and 36.2 million for hatching type eggs. Rate of lay per day on November 1, 1988 averaged 68.9 eggs per 100 layers compared with 67.6 on November 1, 1987 and 67.7 on October 1, 1988.

MONTANA MALTING BARLEY - 1987 CROP

Maltsters and brewers purchased 10.8 million bushels of Montana's 1987 barley crop to make malt. This was 10 percent less than 1986 and represented almost 11.5 percent of Montana total barley production.

Montana growers planted 2.3 million acres of barley in 1987. About 38 percent was seeded to varieties purchased by the malting and brewing industry. If the yield for malting varieties equaled the 45 bushels state average for all barley then nearly 36 million bushels of malting type barley were produced. Since only 10.8 million bushels were used for malt the remaining 25 million bushels either did not make the malting grade or exceeded the demand for malting barley. However, some of the stored 1987 production could have been purchased and utilized as malt in 1988 because of the severe drought.

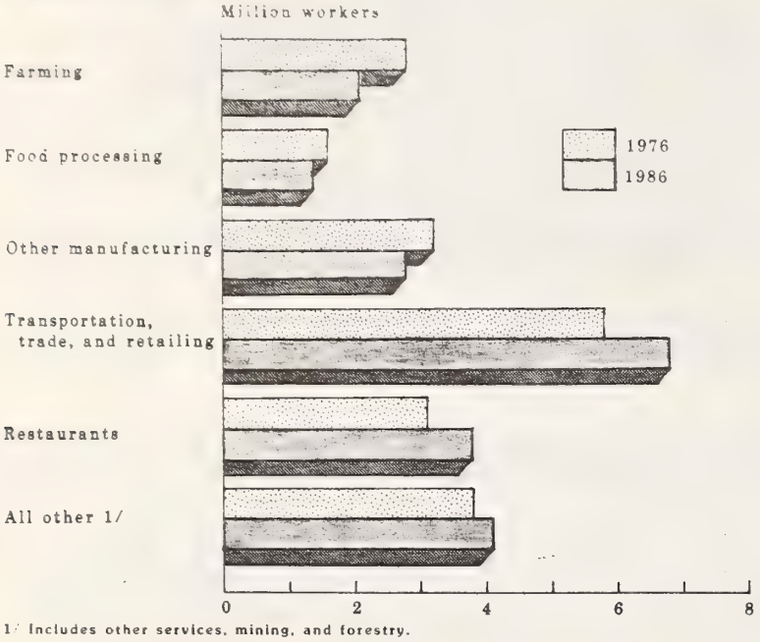
The Food & Fiber System Provided Employment to 21 Million Workers in 1986

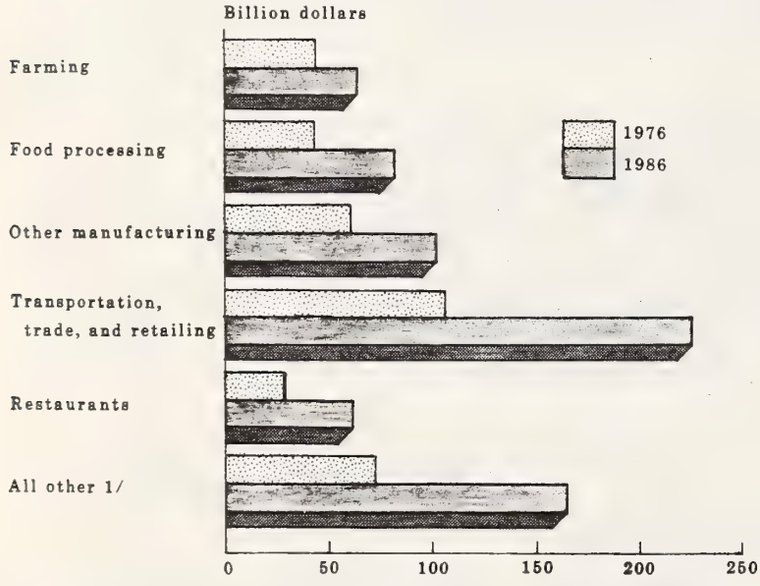


1/ Includes other services, mining, and forestry.

THE U.S. FOOD & FIBER SYSTEM

In 1986, the food and fiber system employed 21 million workers, up from 20.2 million in 1976. However, the system's share of total domestic employment dropped from 21.0 percent to 17.9 percent during the period, reflecting faster growth in the general economy. Transportation, trade, and retailing accounted for the largest number of food and fiber workers in both 1976 and 1986 -- 5.8 million and 6.8 million, respectively. Restaurant employment, spurred by the boom in fast-food outlets, was the fastest growing category, increasing 23 percent during the decade. The number of people employed in farming dropped 25 percent to 2.1 million in 1986. As agriculture has become more mechanized and the number of farms continues to decrease, workers have sought jobs in other sectors of the economy.

The System Also Generated Over $700 Billion Worth of Output



1/ Includes other services, mining, and forestry.
SOURCE: Economic Indicators of the Farm Sector, Farm Sector Review 1986, ECIFS 6-3, ERS, USDA, January 1988

The food and fiber system generated $701.5 billion worth of output in 1986, 16.6 percent of total GNP (Gross National Product). In 1976, the system accounted for $354.6 billion in output, or 19.9 percent of GNP. Because demand for farm products tends to be relatively stable, activities such as producing, assembling, processing, and distributing these products to consumers are also relatively stable. Therefore, as the economy grew during the decade, demand for other products increased at a faster rate, and the food and fiber system's share of output and employment dropped.

SEPTEMBER MANUFACTURED DAIRY

Montana dairy plants produced 103,000 gallons of ice cream in September, down 39 percent from August, and down 27 percent from September 1987. Creamed cottage cheese output, at 254,000 pounds was down 16 percent from last month, and down 19 percent from last year. There were 203,000 pounds of low fat cottage cheese produced compared with 211,000 pounds last month. Butter production was 105,000 pounds, up 17 percent from August, but down 9 percent from September 1987.

U.S. butter production was 83 million pounds, 7 percent above September 1987 and 12 percent above August 1988. Creamed cottage cheese production was 52.6 million pounds, 6 percent below September 1987 and 11 percent below August 1988. Low fat cottage cheese production was 24.0 million pounds, 3 percent above September 1987, but 6 percent above last month.

September ice cream production, at 74.6 million gallons, was down 1 percent from last year. There were 4.18 million gallons of sherbet produced, up 9 percent from September 1987.

RANGE AND PASTURE FEED CONDITION

The state's pasture and range feed condition on November 1 was 37 percent of normal, down 41 points from last year and the lowest November 1 condition on record. Ranges and pastures have been suffering from drought during the entire grazing season. The limited moisture received in September and October aided palatability of the grasses and sustained livestock at the end of the season.

AGRICULTURE PROVIDES JOBS

I'm often asked questions about the importance of agriculture to the state's and the nation's economy. There is no doubt that agriculture is tremendously important. About one out of every 5 jobs is directly related to agriculture.

That job count includes production agriculture (farming and ranching) plus transportation, processing and sales of farm products. So when you think of agriculture, don't just think about our farmers and ranchers. They are only a part of the vast food and fiber distribution chain of the agriculture industry.

In fact, about 25 percent of all jobs in Montana's cities and towns are involved in one way or another with agriculture! That's surprising, but it does help to explain why a depressed or prosperous agriculture has such an impact on both rural areas and cities in the state.

*1988 preliminary estimates.

OCTOBER PRICES RECEIVED

Montana farm prices during October were higher for most grains and hay, but lower for most livestock items than in September. Higher prices for winter and hard spring wheat were partly offset by a lower price for durum. Hay prices increased for the sixth consecutive month and are at a record high for October. Slightly higher prices for steers and heifers were offset by lower prices for cows and calves. Lamb prices increased September to October.

All farm prices are above a year ago in October except sheep, lambs, wool, hogs, cows and milk. The index of prices received for all farm products at 185 (1977=100) is unchanged from September, but 32 points above last year. The all crops index at 174 compares with 170 last month and 110 last October. The livestock and products index at 195 compares with 197 in September and 193 in October 1987.

Nationally, the October all farm products index of prices received by farmers was unchanged from September at 144 percent of its January-December 1977 average. Higher prices for oranges, milk, lettuce, and corn were offset by lower prices for tomatoes, apples, eggs, and soybeans. The index was 17 points (13 percent) above October 1987.

The index of prices paid by farmers for commodities and services, interest, taxes, and farm wage rates for October was 174 percent of its 1977 average. The index rose 2 points (1.2 percent) from July and 9 points (5.5 percent) from last year. Compared to July, prices were higher for feeder cattle and calves while lower for feed and fuels. Since last surveyed in April, prices have also risen for farm machinery, fertilizer, and farm and motor supplies.

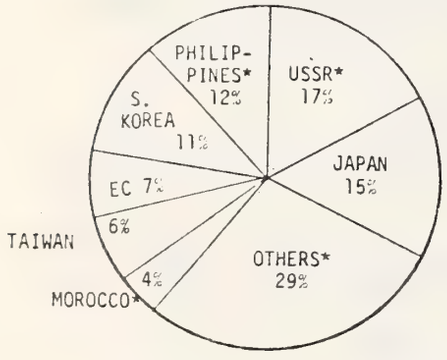
U.S. HARD RED SPRING WHEAT EXPORTS BY DESTINATIONS, 1987-88 (JUNE - MAY)



* Export Enhancement Program

SOVIETS LARGEST IMPORTER OF U.S. SPRING WHEAT

Last year, the Soviet Union was the largest purchaser of U.S. spring wheat. The 1987/88 marketing season also marked the first time that the Soviets bought U.S. Hard Red Spring (HRS) wheat since 1975/76. Previously, the Soviet Union had bought spring wheat from Canada and relied on the U.S. for the lower protein Hard Red Winter Wheat.

Japan and the Philippines were also large importers of HRS.

FOR YOUR INFORMATION

This has been a busy year for those of us involved in agricultural information. Questions and concerns about moisture supplies, crop yields, and pasture conditions came from throughout the nation. We provided input that helped push through disaster legislation. We also helped farmers and ranchers by providing factual information on yields and price.

We're now gearing up to finalize 1988 acreage and production of Montana crops by county. We recently mailed a questionnaire to about half of the farmers and ranchers in the state. The drought situation has resulted in big differences in yields; so more reports are needed to measure those differences. We'll telephone those who don't respond by mail starting about November 1st. We appreciate the input.

Lyle H. Pratt

Lyle H. Pratt, State Statistician

FARMLAND VALUE UPDATE

A possible slowdown in the rise in U.S. farmland values is being shaped by the drought's impact on farm incomes, uncertainty about interest and inflation rates, and the performance of other investment opportunities. The increase in farmland values reported by the Economic Research Service last April -- the first increase since 1982 -- appears to have moderated, according to quarterly surveys taken since then.

In August, an ERS survey of rural appraisers reported a 1.2 percent increase in farmland values nationwide during May-July. This is slightly lower than the 1.8 percent growth reported for the preceding 3 months. Looking ahead to August-October, the appraisers expected values to average only 0.9 percent higher.

The surveys tend to show quarter-to-quarter variability reflecting not only short-term changes in markets, but also longer term changes in expectations. The surveys are barometers of potential longer term market directions.

Only 38 percent of the appraisers in the August survey reported that farmland values rose during the preceding 3 months, compared with 51 percent in the May survey. Fifty-eight percent felt that values had remained the same, up from only 40 percent a quarter earlier.

Appraisers were more bullish, however, for the year ahead. They anticipated a 4.6 percent rise in the coming year, well above the 3.6 percent expected last May and the 2.3 percent expected in November 1987.

Appraisers in the 11 States of the Western region reported a 3 percent increase in land values from the first of May to the end of July, up substantially from the 0.8 percent increase during February-April.

PLEASE RETURN

HARVEST ABOUT OVER

This week's crop-weather report shows harvesting of all crops and seeding of **winter wheat** for harvest in 1989 are virtually complete. This is somewhat ahead of normal due to the beautiful fall weather. Three-fourths of the crop has germinated and emerged compared with a 62% average.

Everyone is concerned about the **moisture situation** with **topsoil** now rated 53% short, 45% adequate and 2% surplus. A lot of precipitation will be needed to bring **subsoil** moisture supplies up to anywhere near normal and replenish water in our lakes and rivers.

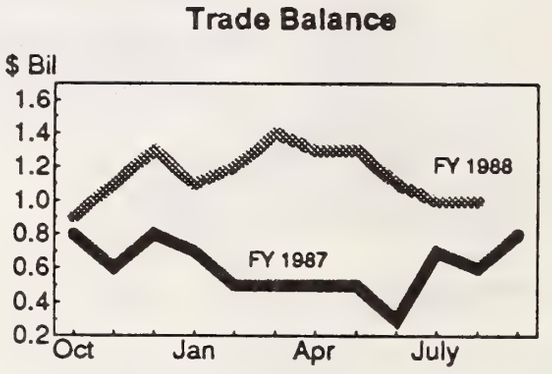
The **livestock situation** shows 90% of the cattle and calves have now been moved from summer pastures to graze on hay meadows and crop stubble. This compares with only 74% in a normal year. Sheep and lambs moved were 95% compared with a normal average of 79%. Most are trying to stretch their hay supplies and avoid buying at $80+ per ton.

TURKEYS

There will be plenty of turkey for Thanksgiving, but retail bargain-basement prices won't be as noticeable as in 1987. Wholesale turkey prices have been rising since late May, with hen turkey prices in the East currently averaging 75 cents per pound, compared with 56 cents a year ago. Third-quarter prices could average 72-73 cents with production below last year's level. Poult placements since March fell 5 percent from a year ago, but total placements for 1988 slaughter are up 2 percent. Production during January-July was up 13 percent from last year but probably will increase only 4 percent for the year.

TRADE SURPLUS

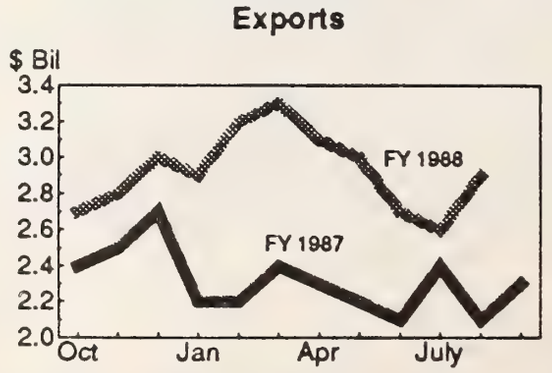
The U.S. agricultural trade surplus remained near $1 billion for the third consecutive month in August, virtually unchanged from June and July. Exports and imports both grew substantially in August, by $254 million and $303 million, respectively. According to Census Bureau data, August's surplus of $979 million exceeded August 1987 by more than 60 percent. Cumulatively, FY 1988's surplus is nearly twice the value of the same 11 months of FY 1987.



EXPORTS

U.S. agricultural exports increased $254 million to nearly $2.9 billion in August, ending a 4-month decline. Corn exports jumped $137 million, helping offset declines for vegetable oils, fruits and vegetables, cotton, and rice. Meat products, wheat, and soybean values also gained during August.

Higher export prices for **wheat** offset a decline in volume from July, and wheat exports rose $26 million. Reduced shipments to China and Egypt offset increased exports to India and Pakistan. Export prices rose in lagged response to drought-induced market price gains, and Export Enhancement Program bonuses shrank.



SEPTEMBER SLAUGHTER

Montana slaughter plants produced 1.4 million pounds of red meat in September 1988. This production is down 17 percent from last month, and down 5 percent from the September 1987 production.

The number of cattle slaughtered, at 1,600 head, was down 200 head from last year, and total liveweight was down 15 percent from last year. Hog slaughter, at 2,800 head was up 400 head from last year, and total liveweight was up 19 percent.

Commercial red meat production for the United States in September 1988 totaled 3.46 billion pounds, up 4 percent from September 1987. January - September red meat production, at 29.5 billion pounds was up 4 percent from last year. The percentage changes from 1987 accumulated production by individual components were: beef, up 1; veal, down 7; pork, up 10; lamb and mutton, up 7. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

CATTLE ON FEED DOWN 5 PERCENT IN 13 QUARTERLY STATES

Cattle and calves on feed October 1, 1988, for slaughter in the 13 Quarterly States totaled 8.58 million head, down 5 percent from October 1, 1987, but 5 percent above 1986.

The cattle on feed inventory included 5.54 million steers and steer calves, 6 percent below last year but 7 percent above 1986. This group represented 65 percent of the total October number on feed, compared to 66 percent last year and 63 percent in 1986. Heifers and heifer calves accounted for 3.01 million, down 2 percent from a year ago but up 1 percent from 1986.

PLACEMENTS of cattle and calves on feed during the July-September quarter totaled 5.96 million, down 10 percent from last year and 6 percent below the comparable period in 1986. OTHER DISAPPEARANCE of 223 thousand head leaves NET PLACEMENTS at 5.74 million.

MARKETINGS of fed cattle for slaughter during July-September totaled 6.15 million, 2 percent more than 1987 and 5 percent above the same period in 1986.

MILK PRODUCTION

Montana's milk production during the third quarter of 1988 was 91 million pounds. This production reflects a 6 percent increase from the July-September period for 1987. Milk cow numbers held steady from last year at 25,000.

Grain and other concentrates fed to milk cows on October 1 averaged 15.5 pounds per head, the same as last year. The cost per hundredweight of these feeds increased $1.50 to average $7.70/cwt.

Nationally, milk production was up slightly at 36.0 billion pounds, compared with 35.5 in the period of July-September 1987. The average number of cows in the U.S. during the July-September quarter was 10.2 million head, 0.6 percent below July-September last year.

FEWER CATTLE IN MONTANA

There have been a lot of questions and concerns recently about Montana's shrinking cattle herd. We survey farmers and ranchers during January each year measuring the number on hand as of January 1. Every 5 years the Census of Agriculture contacts all producers for a detailed count. The inventory count as of January 1, 1988 pegged all cattle and calves in Montana at 2,350,000 head -- the lowest number since 1963 (25 years ago). The record high cattle herd was set in 1974 when over a million more cattle and calves called Montana 'home'.

Why have numbers dropped so drastically? Part of it is the normal cattle cycle and part of it is the drought. Nationally, numbers are also down, dropping below 100 million for the first time since 1961. Even though prices during the past couple of years have been good, continued drought has reduced feed supplies and prevented herd expansion.

DEPICTS SHORT TERM (UP TO ABOUT 4 WEEKS) ABNORMAL DRYNESS OR WETNESS AFFECTING AGRICULTURE. RESPONDS RAPIDLY, CAN CHANGE CONSIDERABLY WEEK TO WEEK, AND INDICATES NORMAL CONDITIONS AT THE BEGINNING AND END OF THE GROWING SEASON.
USES...APPLICABLE IN MEASURING THE SHORT TERM, WEEK-TO-WEEK, STATUS OF DRYNESS OR WETNESS AFFECTING WARM SEASON CROPS AND FIELD OPERATIONS.
LIMITATIONS...MAY NOT BE APPLICABLE TO GERMINATING AND SHALLOW ROOTED CROPS WHICH ARE UNABLE TO EXTRACT THE DEEP OR SUBSOIL MOISTURE FROM A 5-FOOT PROFILE, OR FOR COOL SEASON CROPS GROWING WHEN TEMPERATURES ARE AVERAGING BELOW ABOUT 55°F. IT IS NOT GENERALLY INDICATIVE OF THE LONG TERM (MONTHS, YEARS) DROUGHT OR WET SPELLS WHICH ARE DEPICTED BY THE DROUGHT SEVERITY INDEX.
NOAA/USDA JOINT AGRICULTURAL WEATHER FACILITY
Based on preliminary reports

MOISTURE RESERVES LACKING

The rains that fell during mid-September helped put a lot of green back in Montana, but failed to replenish subsoil moisture. The state's winter wheat crop has mostly emerged and is in fair to good condition. Stubble fields and ranges are providing some grazing for the first time this season.

The limited rainfall leaves the state's agriculture in about the same condition that existed a year ago -- highly subject to wind damage and drought damage unless a lot more rainfall occurs.

OCTOBER CROP REPORT

Montana's **wheat** crop estimate on October 1, at 60.2 million bushels was unchanged from a month earlier. This latest forecast is based on more complete farmers' reports of harvested acreage and production which is down 60% from last year. By class, **winter wheat** production is 39.9 million bushels with a per acre yield of 19 bushels; **hard spring wheat** production is 18 million bushels, with an average yield of 12 bushels; and **durum** is 2.3 million bushels with an average yield of 10 bushels.

Barley production in Montana, at 28.75 million bushels, is up 5 percent from the September estimate but is 70 percent under last year's output. Barley producers averaged 23 bushels per acre. **Oats** production, at 2.7 million bushels, is down 55 percent from a year ago. The oats average yield per acre was 30 bushels. **Alfalfa** hay production, at 1.8 million tons, is up 5 percent from the August forecast, but 37 percent under last year. All other hay production, at 950 thousand tons, is down 9 percent from the August forecast and 30 percent under last year.

Nationally, winter wheat production is estimated at 1.56 billion bushels virtually unchanged from both 1987 and the August 1 forecast. **Other spring wheat** production, at 205 million bushels, is the lowest since 1969 and is down a whopping 54 percent from 1987. **Durum wheat** production is estimated at 46.4 million bushels, the lowest level since 1961, and is down 50 percent from 1987. **Barley** production in 1988 is estimated at 283 million bushels, 47 percent below last year's crop of 530 million bushels and the lowest since the 1953 crop.

AUGUST MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 170,000 gallons of ice cream in August 1988, down 6 percent from July, but up 21 percent from August 1987. Creamed cottage cheese output, at 303,000 pounds was down 2 percent from July, and down 3 percent from last year. Butter production was 90,000 pounds, 50 percent greater than July, but 2 percent less than August 1987.

U.S. butter production was 74.2 million pounds in August, 12 percent above August 1987, but 2 percent below July 1988. Creamed cottage cheese production was 59.3 million pounds, 4 percent above August 1987, and 6 percent above July 1988. June ice cream production, at 87.7 million gallons, was up 4 percent from last year. There were 5.21 million gallons of sherbet produced, up 13 percent from August 1987.

HOG NUMBERS UP 4 PERCENT

Inventory of all hogs and pigs in the **U.S.** on September 1, 1988 is estimated at 58.3 million head. This is the first September 1 U.S. estimate and is 4 percent above June 1, 1988.

---**Breeding inventory** at 7.30 million head is down 3 percent from June 1, 1988.

---**Market hog inventory** at 51.0 million head is 5 percent above June 1, 1988.

Inventory of all hogs and pigs on September 1, 1988, in the **10 quarterly** estimating states is estimated at 45.1 million head, 5 percent above last year. This is 14 percent larger than September 1, 1986 and the highest September 1 inventory since 1983.

AUGUST RED MEAT PRODUCTION UP 4 PERCENT

Montana slaughter plants produced 1.7 million pounds of red meat in August 1988. This production is up 37 percent from last month, and up 4 percent from the August 1987 production.

The number of cattle slaughtered, at 2,000 head, was up 100 head from last year, while total liveweight was down 4 percent from last year. The average liveweight of cattle slaughtered was 966 pounds -- 6 percent lighter than last year's average liveweight. Hog slaughter, at 3,200 head, was up 600 head from last year, and total liveweight was 24 percent above last year.

Commercial red meat production for the United States in August 1988 totaled 3.51 billion pounds, up 12 percent from August 1987. January-August red meat production, at 26.0 billion pounds was up 4 percent from last year. The percentage changes from 1987 accumulated production by individual components were: Beef, up 1; Veal, down 8; Pork up 10; Lamb and Mutton, up 9. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

CATTLE ON FEED IN 7 STATES DOWN 2 PERCENT FROM LAST YEAR

Cattle and calves on feed September 1, 1988, for slaughter market in the 7 States preparing monthly estimates totaled 6.67 million head, down 2 percent from a year ago but up 4 percent from September 1, 1986.

MARKETINGS of fed cattle during August totaled 1.72 million, unchanged from last year but up 4 percent from two years ago.

PLACEMENTS of cattle and calves on feed in the 7 States during August totaled 1.62 million, down 16 percent from last year and down 10 percent from August 1986. NET PLACEMENTS of 1.55 million for August are 16 percent below last year and 10 percent below 1986.

OTHER DISAPPEARANCE totaled 64 thousand head, compared to 68 thousand during August 1987 and 70 thousand during August 1986.

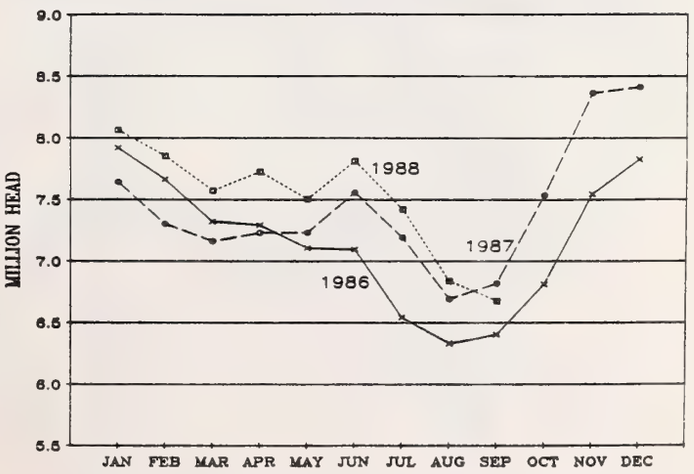
7 STATES



U.S. WHEAT SUPPLY DOWN OVER 20 PERCENT

U.S. wheat production was estimated in September at 1.81 billion bushels for 1988/89, down 14 percent from a year earlier and the lowest since 1978/79.

Wheat stocks on June 1, 1988, were 1,266 million bushels, 555 million below a year earlier. A large portion of those stocks (520 million) remain on farms, mostly in the Farmer Owned Reserve (FOR). Additional stocks are under the regular 9-month loan program or in Commodity Credit Corporation (CCC) stocks. Free stocks excluding 9-month loans were 301 million bushels, sharply higher than in previous years but still small compared to projected total use of 2.6 billion bushels.

U.S. wheat supplies in 1988/89 are forecast at 3.1 billion bushels. This would be more than enough to cover the record use of 2.7 billion in 1987/88, or the 2.6 billion forecast use in 1988/89, or even enough to fulfill last year's record domestic use and record exports of 1981/82. However, the ratio between supply and forecast demand is the tightest since 1973/74.

Drought in the United States and Canada, together with dry conditions in Argentina, has cut forecast 1988/89 production, tightened exportable wheat supplies, and pushed world wheat export prices up. Foreign consumption is forecast to exceed foreign production by more than 10 percent, requiring a further global stock drawdown. Trade is expected to decline because of higher export prices, an expected drop in Soviet imports, and reduced exportable supplies.

EGG PRODUCTION DOWN 6 PERCENT

Montana poultrymen produced 49 million eggs during the quarter ending August 31, 1988, 6 percent less than during the same period last year. The average number of **layers** on hand in the June through August period was 780,000 layers, down 1 percent from the same period last year. **Rate of lay** during the quarter averaged 62.8 eggs per 100 layers compared with 66.0 eggs per 100 layers during this quarter in 1987.

The **Nation's** laying flocks produced 16.9 billion eggs during the June through August quarter, down 2 percent from the corresponding quarter a year ago. Production included 14.8 billion for table eggs and 2.10 billion for hatching eggs. Layers for the quarter averaged 269 million, down 3 percent from the 277 million a year ago.

All layers in the U.S. on September 1, 1988 totaled 270 million, compared with 279 million a year ago. The 270 million layers consisted of 233 million for production of table or commercial type eggs and 36.6 million for hatching type eggs. **Rate of lay** per day on September 1, 1988 averages 68.0 eggs per 100 layers compared with 67.3 for September 1, 1987 and 68.4 on August 1, 1988. Egg production during August 1988 is estimated at 5.70 billion compared to 5.79 billion last year.

Laying flocks in the 20 major egg production States produced 4.74 billion eggs during August, down 1 percent from the 4.80 billion produced a year ago. The number of layers during August averaged 224 million, down 3 percent from a year ago.

AUGUST MILK PRODUCTION UP 1 PERCENT

Milk production in the 21 selected States totaled 10.3 billion pounds. This was 1 percent more than production in these same States for August 1987.

During the April-June period the 21 selected States produced 84.9 percent of the U.S. production. If producers in the remaining 29 States not surveyed for September 1, followed the trend shown by the reporting States, the U.S. milk production would total about 12.1 billion pounds for August.

Production per cow in the 21 selected States averaged 1,199 pounds during August, 26 pounds above August 1987.

Milk cows in the 21 selected States averaged 8.58 million head, 1 percent less than August last year and were virtually unchanged from the previous month.

1988 POTATO DISPOSITION

The **Nation's potato** farmers produced 385 million cwt of potatoes in 1987. The value of that production reached $1.66 billion, which was 8 percent below 1986 mainly because of a lower price.

Of the total production, 348 million cwt were sold, a record high. Processors bought 197 million cwt, a gain of 2 percent. Table stock accounted for 126 million cwt, up 16 percent, while seed and livestock feed sales claimed 24.6 million, up 1 percent. Non-sales were 37.3 million which included a 12 percent increase in shrinkage.

Frozen french fries were the major processed item using a record 103 million cwt. Chip usage was 40.5 million, dehydration claimed 30.8 million and other frozen products was 16.5 million.

In **Montana**, total production was 2.4 million cwt of which 2.0 million were sold. The largest sales use was for certified seed.

WHY DON'T CASH RECEIPTS FALL IN A DROUGHT?

Since droughts have a severe impact on current production, why don't cash receipts fall? Cash receipts grew nearly $8 billion in the 1980 drought and are forecast to rise $5-$9 billion this year.

One reason is that the prices of drought-affected commodities tend to increase by more than production falls, raising the total value of the crop. Another reason is that marketing does not drop as much as production because stocks are sold to make up the harvest shortfall.

Economists say that the demand for farm commodities is inelastic, meaning that a 1-percent drop in production leads to greater than a 1-percent increase in price. For example, of the elasticity of demand for corn were -0.3, a 30-percent decline in corn production would double the price.

Some farmers may benefit from the higher prices -- those in areas with adequate rainfall, those who irrigate, and those with large unsold stocks of previous years' crops.

However, higher cash receipts for the sector do not imply that all farmers are better off because of the drought. Many farmers will suffer large declines in cash receipts if their individual production falls by much more than prices rise. Farmers in drought-stricken areas without large stocks of unsold crops from previous years have little to fall back on.

GOOD NEWS, RAIN AND SNOW!

At last -- some good news! Rains early last week greatly helped soil moisture. Topsoil was rated only 35% short and 62% adequate. On the other hand, subsoil moisture is still 80% short.

Winter wheat seeding will now proceed rapidly, but up to now is only 15% complete compared with an average of 35%. Harvesting of corn silage, dry beans and potatoes is progressing very well. About 3/4 of the corn silage and dry beans have been harvested -- about normal for this date. Potato harvest is 15% done, also normal for this date, but behind last year's pace.

The livestock situation shows an improvement in pasture and range conditions, but feed is still critically short. About 3/4 of the cattle, sheep and lambs have been moved from summer range -- well ahead of normal for this date. We're still looking for more moisture to push germination and growth of winter wheat before cold weather sets in.

HIGHLIGHTS:

Manufactured Dairy Products
Pasture & Range Feed Condition
September 1 Crop Production
All Wheat - Selected States
Wheat and Barley Movement

JULY MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 181,000 gallons of ice cream in July 1988, 5 percent more than last month, and 11 percent more than July 1987. Creamed cottage cheese output, at 309,000 pounds was 9 percent greater than last month's production, and 6 percent less than July last year. Butter production was 60,000 pounds in July 1988, 8 percent lower than June, and 39 percent lower than June 1987.

U.S. butter production was 75.9 million pounds in July, 1 percent above July 1987, but 17 percent below June 1988. Creamed cottage cheese production was 56.0 million pounds, 5 percent below July 1987 and 2 percent below June 1988. June ice cream production, at 88.8 million gallons, was down 4 percent from last year. There were 5.76 million gallons of sherbet produced, up 9 percent from July 1987.

PASTURE & RANGE FEED CONDITION

Montana's September 1 pasture and range feed condition at 29% is the lowest since 1936. Ranges and pastures have been suffering from drouth during the entire growing season. Only in the western section did grasses make any growth earlier in the season. Livestock producers will be further adjusting herd sizes to existing hay supplies as fall and winter grazing will be limited.

SEPTEMBER 1 CROP PRODUCTION

Montana's wheat crop is expected to total 60.2 million bushels, down 60 percent from last year. The September 1 forecast is based on farmers' reports of yield and is largely unchanged from the August 1 estimate. By class, **winter wheat** production is forecast at 39.9 million bushels with a per acre yield of 19 bushels; **hard spring wheat** at 18 million with a yield of 12 bushels; and **durum** at 2.3 million with a yield of 10 bushels.

Barley in Montana, at 27.5 million bushels, is down 71 percent from a year ago. Barley is expected to yield 22 bushels per acre.

The state's **sugarbeet** crop at 1,054 thousand tons is 3 percent under last year.

Nationally, corn for grain production is forecast at 4.46 billion bushels, down slightly from last month and 37 percent below last year's crop. **Sorghum** grain production is forecast at 540 million bushels, down 27 percent from 1987. **Soybean** production is forecast at 1.47 billion bushels, 23 percent below 1987 and the smallest crop since 1976. **All wheat** production is forecast at 1.81 billion bushels, down 14 percent from last season.

1/ District data funded by the Montana Wheat & Barley Committee.

AUGUST PRICES RECEIVED

Montana's all wheat price the middle of August was $3.82 a bushel -- the highest since June 1984, but well under the record of $5.45 set in February 1974. Barley prices at $2.68 per bushel were 29 cents below the record set in 1981. All hay, at $82.00 per ton, is still $8.00 per ton under the record last set in April 1986.

The index of prices received by Montana farmers for all products reached 174 (1977=100), 12 points above July and 31 points above August 1987. The index was pushed by an 8 point increase in the crops index, and a 17 point jump in the livestock index. Price increases from July were noted for all items except sheep, lambs, hogs, eggs and wool.

The August all farm products index of prices received by **U.S.** farmers increased 3 points from July to 144 percent of its January-December 1977 average. Higher prices during August for cattle, apples, tomatoes, and lettuce were partially offset by lower prices for cotton, corn, onions, and soybeans. The index was 17 points above a year ago.

All feed grain and soybean prices declined from July but rough rice and all wheat prices increased slightly. Average prices of beef cattle and calves increased sharply from July but were below the high levels recorded during February through May of this year.

WHEAT & BARLEY MOVEMENT

Montana wheat shipped to out-of-state destinations in December 1987 - May 1988 at 67.5 million bushels was 14 percent above the same period last year. Shipments to eastern destinations totaled 1.1 million bushels, down 32 percent from last year. Movement to the west was up 16 percent at 65.4 million bushels. Other destinations, mostly south and southeast of Montana, received 1.0 million bushel, down 14 percent from last year. Rail movement amounted to 60.1 million bushels - 89 percent of total shipments compared with 83 percent in the 1986-87 period.

Montana barley shipped to out-of-state destinations, December 1987 - May 1988, was 15.7 million bushels, about half the record movement in the same period last year. Shipments to western destinations were down 59 percent and eastern destinations were down 11 percent. Barley hauled by rail was 88 percent of total movement, compared with 93 percent in the 1986-87 period.

JULY MEAT PRODUCTION DOWN

Montana slaughter plants produced 1.2 million pounds of red meat in July 1988. This production is down 14 percent from the previous month, and down 25 percent from the July 1987 production.

The number of cattle slaughtered, at 1,400 head, was down 700 head from last year, and total liveweight was down 36 percent. Hog slaughter, at 2,400 head, was up 200 head from last year, and total liveweight was 11 percent above last year.

Commercial red meat production for the **United States** in July 1988 totaled 3.17 billion pounds, nearly the same as July 1987. January-July red meat production, at 22.5 billion pounds was up 3 percent from last year. The percentage changes from 1987 accumulated production by individual components were: Beef, nearly the same; Veal, down 11; Pork, up 9; Lamb and Mutton, up 7. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

7 STATE CATTLE ON FEED UP 2 PERCENT

Cattle and calves on feed August 1, 1988, for slaughter market in the 7 States preparing monthly estimates totaled 6.84 million head, up 2 percent from a year ago and up 8 percent from August 1, 1986.

MARKETINGS of fed cattle during July totaled 1.77 million, up 4 percent from both last year and 1986. This is the largest number of fed marketings in July since 7 State estimates began in 1972.

PLACEMENTS of cattle and calves on feed in the 7 States during July totaled 1.25 million, down 2 percent from last year and down 19 percent from July 1986. NET PLACEMENTS of 1.18 million for July are 2 percent below last year and 20 percent below 1986.

OTHER DISAPPEARANCE totaled 62 thousand head, compared to 71 thousand during July 1987 and 64 thousand during July 1986.

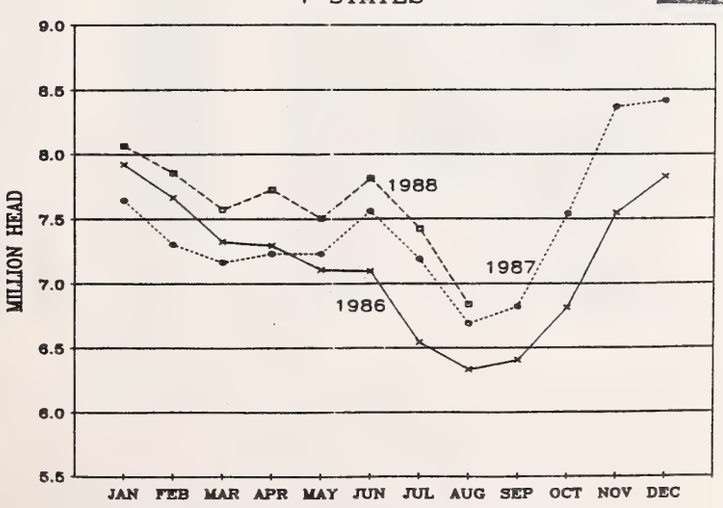
7 STATES



NUMBER of WORKERS & WAGE RATES INCREASE

There were 3.52 million people working on the Nation's farms and ranches during the week of July 10-16, 1988. This number was up 1.5 percent from the 3.47 million workers during the comparable week in 1987. Self-employed farm operators accounted for 1.43 million of the total, along with 591,000 unpaid workers, and 1.20 million workers hired directly by farm operators. Agricultural Service employees made up the remaining 303,000 workers.

Farm operators paid their hired workers an average rate of $4.90 per hour during the July 1988 survey week. This rate was up 12 cents from a year earlier. Workers paid on an hourly basis earned $4.72 per hour compared with $4.59 last July. Field workers received an average of $4.63 per hour, up 3 cents from the July 1987 week. Livestock workers earned $4.50 compared with $4.29 per hour a year earlier.

JULY MILK PRODUCTION UP 1 PERCENT

Milk production during July 1988 in the 21 selected States totaled 10.5 billion pounds, 1 percent above production in these same States for July 1987.

During the April-June period the 21 selected States produced 84.9 percent of the U.S. production. If producers in the remaining 29 States not surveyed for August 1, followed the trend shown by the reporting States, the U.S. milk production would total about 12.4 billion pounds for July.

Production per cow in the 21 selected States averaged 1225 pounds during July, 25 pounds above July 1987.

The average number of milk cows during July 1988 in the 21 selected States was 8.58 million head, 9 thousand head less than a month earlier and 84 thousand head fewer than July 1987.

Self-employed farm operators worked an average of 44.4 hours, 2.7 hours less than the comparable week in 1987. Unpaid workers averaged 37.3 hours, 1.7 hours less than last year. Hired employees worked 37.4 hours compared with 37.9 hours last July.

Benefits, such as housing and meals, were provided to 44 percent of the hired workers during the survey week. This compares with 45 percent during the July 1987 survey week. Data from the Farm Cost and Returns Survey showed that the value of benefits including insurance and retirement, FICA and other compensation taxes, housing, and other non-cash perquisites represented 15 percent of the total farm and ranch expenditures for farm labor in 1987. This percent was unchanged from 1986.

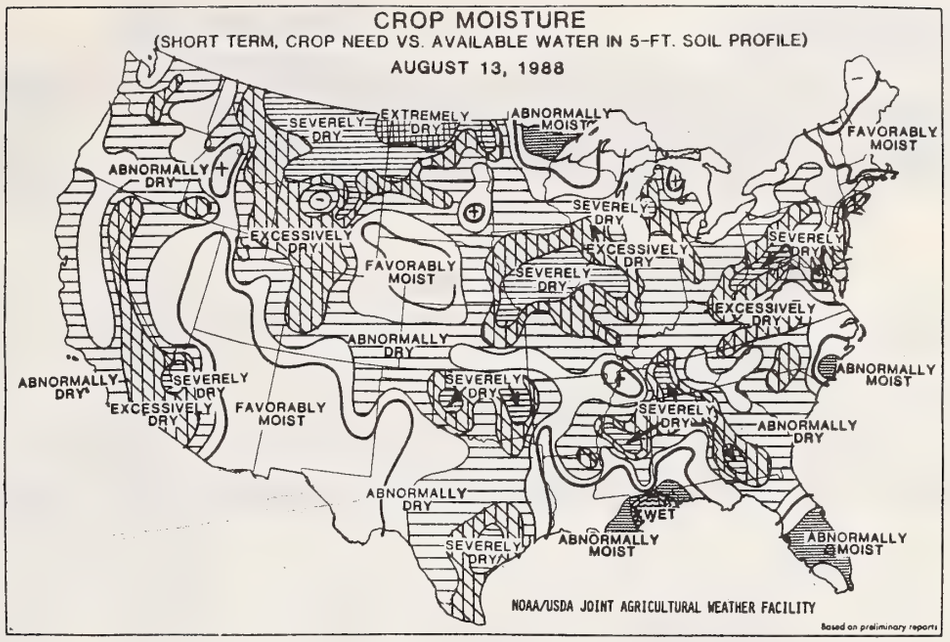
DRY WEATHER CONTINUES

This week's crop-weather report shows conditions virtually the same as a week ago. A few scattered showers did little more than settle the dust. The dry weather allowed farmers to make good progress toward finishing up small grain harvest which is now 80% complete, compared with only 30 to 40% a year ago. If there is anything good about this weather, it's the fact that it's allowed farmers to harvest without moisture damage like we had back in 1985. Topsoil and subsoil moisture remain over 90% short.



Livestock are being moved to wherever there's a spare blade of grass and some stockwater. About 30% of the livestock have already been moved from summer pasture, compared with about 8% in a normal year. Range and pasture feed is rated 78% poor to very poor compared with a normal year.

Rain is needed prior to seeding winter wheat and so far there is none in the forecast - so think rain folks!

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 173,000 gallons of ice cream in June 1988, 33 percent more than last month, but 28 percent less than June last year. Creamed cottage cheese output, at 284,000 pounds, was only slightly less than last month, but 14 percent lower than a year ago. Butter production was 65,000 pounds in June 1988, 39 percent lower than May, but 2 percent higher than June 1987.

U.S. butter production was 91.7 million pounds in June, up 13 percent from June 1987, but 15 percent below May 1988. Creamed cottage cheese production was 57 million pounds, 6 percent below last year and 1 percent below May 1988. June ice cream production, at 94.1 million gallons was up 2 percent from last year. There were 5.84 million gallons of sherbet produced, up 7 percent from June 1987.

AUGUST 1 CROP PRODUCTION

Montana's wheat crop, shrunk by drouth, is estimated to be only 40 percent of last year's production. Total winter, spring and durum wheat, at 60.4 million bushels, was smaller only 5 times during the last 50 years - in 1939, 1940, 1945, 1961, and 1985. **Winter wheat** production, impacted least by the drouth, is estimated at 39.9 million, about half last year's crop. Winter wheat yield is expected to average 19 bushels per acre, well below the ten year average of nearly 31 bushels. **Spring wheat** other than durum production, at 18 million, is only 27 percent of last year and the lowest since 1961. Spring wheat yield per acre is forecast at 12 bushels, and harvested acres is estimated to be 1.5 million. **Durum** production, at 2.53 million, is 48 percent of last year. Yield is estimated at 11 bushels per acre.

Montana's **barley** crop, at 27.5 million, is only 29 percent of last year's record and is the lowest in 27 years. Barley yield is forecast to be 22 bushels per acre. **All hay** production in Montana, at 2,755 thousand tons is 35 percent under last year and the lowest since 1961. **Sugarbeet** production is estimated to be 1,054 thousand tons, 3 percent under a year ago. Corn for grain, at 1,870 thousand bushels, is 19 percent more than a year ago, while dry beans, at 120 thousand cwt, are 4 percent less.

Nationally, all wheat total production is forecast at 1.82 billion bushels, off 13 percent from 1987 and the lowest since 1978. All wheat yield is expected to average 34.4 bushels per acre, 3.2 bushels less than 1987.

Barley total production is forecast at 288 million bushels, down 1 percent from last month and a 45 percent reduction form last year's output. This is the smallest crop since 1953. The expected yield per acre is forecast at 38.9 bushels compared with last season's average of 52.6 bushels.

1/ District data funded by the Montana Wheat & Barley Committee.

JULY PRICE INDEX UP 13 POINTS FROM JUNE

The July index of prices received by **Montana** farmers and ranchers moved up 13 points from June. The all farm products index, at 163 percent of its 1977 average, was pushed higher by a 32 point increase in the all crops index. The livestock and livestock products index declined 2 points, partially offsetting the jump from the drought shorted crops.

The July 15th prices for Winter wheat at $3.35, Durum wheat at $6.25 and Spring wheat (other than Durum), at $4.05, were up $.34, $2.23 and $.79, respectively, from June. Barley, at $2.33, was up $.49; while Oats, at $2.30, was up $.31 from June. Alfalfa hay, at $71.00, was up $10.00 per ton and All Other Hay, at $61.00 per ton, was up $6.00. Cattle prices were off from the June average as follows: Cows $45.20, down $.10; Steers and Heifers $69.20, down $1.00; and Calves $79.00, down $2.80. Sheep, at $15.00, declined from $17.30 in June, while lambs sold for $63.00 compared with $62.50 in June. Hogs, at $38.10, were down $2.40.

The all farm products index is 30 points higher than July 1, 1987. All commodities were above last July's level except for sheep, lambs, hogs and milk.

The **U.S.** July all farm products index of prices received by farmers increased 5 points (3.6 percent) from June to 142 percent of its January-December 1977 average. Higher prices for corn, soybeans, and eggs were partially offset by lower prices for oranges, cattle, and hogs. The index was 13 points (10 percent) above a year ago.

The July index of prices paid by farmers for commodities and services, interest, taxes, and farm wage rates was 172 percent of its 1977 average. The index was 4 points (2.4 percent) above April 1988 and 8 points (4.9 percent) above a year ago. Compared to last quarter, higher prices for feed and gasoline were only partially offset by lower feeder livestock prices.

U. S. CATTLE NUMBERS DOWN

All cattle and calves in the United States as of July 1, 1988, totaled 108 million head, down 1 percent from the 110 million on July 1, 1987, and 4 percent below the 112 million two years ago, according to the Agricultural Statistics Board. The downward trend in cattle inventories began six years ago, and the current July 1 number is the lowest mid-year inventory since mid-year estimates were begun in 1973.

All cows and heifers that have calved, at 44.0 million, were down 1 percent from 44.4 million a year ago and down 2 percent from 45.0 million two years ago.

-- Beef cows, at 33.8 million, were 1 percent below both July 1, 1987 and 1986.
-- Milk cows, at 10.3 million, were 1 percent below July 1, 1987, and 6 percent below two years ago.

CATTLE & CALVES: Number by Class & Calf Crop, United States, July 1, 1986-88

Class	1986	1987	1988	1988 as % 1987
	1,000 head			Percent
Cattle and calves	112,200	109,500	107,900	99
Cows and heifers that have calved:	45,000	44,400	44,000	99
Beef cows	34,150	34,000	33,750	99
Milk cows	10,850	10,400	10,250	99
Heifers 500 pounds and over	17,500	17,000	16,500	97
For beef cow replacement	4,800	4,800	4,800	100
For milk cow replacement	4,700	4,600	4,400	96
Other heifers	8,000	7,600	7,300	96
Steers 500 pounds and over	15,300	14,800	14,500	98
Bulls 500 pounds and over	2,200	2,200	2,200	100
Calves under 500 pounds	32,200	31,100	30,700	99
Calf crop 1/	41,141	40,026	40,200	100

1/ for the current year, the calf crop is the number of calves born before July 1 plus the number expected to be born on and after July 1.

WHEAT VARIETIES

Neeley jumped into the top spot among **winter wheat** varieties replacing Redwin as the most widely planted variety. Neeley was planted on 623,700 acres or 25.5 percent of the 1988 acreage. This is almost double the 1987 Neeley acres. Although **Redwin** dropped to second position, its acreage decreased only 2,000 from last year to 491,000 acres in 1988. **Winalta** acreage fell by 18,800, but moved up to third position. **Rocky** gained 11,000 acres and moved into fourth. **Norstar** lost 57,900 acres and dropped into fifth.

Newana remains the top **spring wheat** variety even though its acreage is down by one-third from 1987. Newana covers 336,100 acres or 16.8 percent of Montana's spring wheat acres in 1988. **Len** moved into second position with a small increase to 288,000 acres. **Fortuna** dropped to third position with a cut in acreage of almost one-half to 245,300 in 1988. **Lew** retained fourth position, but also saw a drop in acreage to 215,300 this year.

Once again **Vic** holds the top spot among **durum** varieties despite being the only variety of the top nine to decrease in acreage. Vic dropped 18,300 acres to 83,200 or 29.7 percent of the total acreage in 1988. The acreage of **Ward**, second position, doubled to 47,800 this year. In third position, **Crosby** acreage more than doubled from last year to 41,200 acres in 1988.

MONTANA BARLEY VARIETIES

The 1988 planted acreage of **barley** in Montana at 1.8 million acres, is down nearly 22 percent from 1987. The top five varieties all saw substantial cuts in acreage. **Hector,** with 573,100 acres, remains the most widely planted variety. **Piroline** moved back into second position this year with 253,200 acres. **Klages** dropped to third position overall but remained the top malting variety. With 198,500 acres, **Klages** covers over one-half of the acres planted to malting varieties. **Harrington** moved into fourth position overall with 189,200 acres. **Clark,** a malting variety, decreased by more than one-half of its 1987 acreage to 120,400 this year.

1/ Revised. 2/ Preliminary. M - American Malting Barley Improvement Association, Inc. recommended malting varieties for Montana.

PELT PRODUCTION DOWN 4 PERCENT

Mink pelt production in the United States in 1987 totaled 3.95 million pelts, down 3 percent from 1986. Wisconsin, the major mink State, produced 1.09 million pelts.

By color class, the number of pelts as a percent of the total U.S. production was: Standard - 41.6 percent; Demi-buff - 12.8 percent; Mahogany - 10.8 percent; Ranch Wild - 9.5 percent; Gunmetal - 6.1 percent; Pastel - 5.6 percent and White - 3.2 percent. The remaining color classes accounted for 10.4 percent.

Mink pelts sold during the 1987 crop year were valued at $170.00 million dollars, up fractionally form the 169.2 million a year ago. The average price per pelt for the 1987 crop year was $43.00, compared with $41.30 in 1986 and $28.00 in 1985.

Female mink bred to produce kits in 1988 totaled 1.15 million, up 6 percent from 1987. Females bred for the three major color classes are: Standard - 540 thousand; Demi-buff - 124 and Ranch Wild - 118 thousand. Females bred in the leading states are: Wisconsin - 311 thousand; Utah - 161 thousand and Minnesota - 143 thousand.

Percent of total females bred to produce kits in 1988 by color class are: Standard - 47.1 percent; Demi-buff - 10.8 percent; Ranch Wild - 10.3 percent; Gunmetal - 7.2 percent; Mahogany - 6.8 percent; Pastel - 4.9 percent; and Violet-type - 3.1 percent. The remaining color classes accounted for 9.8 percent.

There were 970 mink farms producing pelts in 1987 compared with 989 the previous year. Leading States were Wisconsin with 213 farms, Minnesota with 143 and Utah with 126 farms.

MILK PRODUCTION UP

Montana dairymen produced 90 million pounds of milk in the second quarter of 1988. This production was 6 percent more than the production for the April-June period of 1987. Milk cow numbers held steady from a year ago this time at 25,000 head. Production per cow was up 6 percent from last year.

On July 1, grain and other concentrates fed averaged 15.5 pounds per milk cow, up one pound per day per head from last year. The average cost of these concentrates was up from $6.20 in 1987 to $6.90/cwt. this year.

Nationally, the quarterly production of milk for the U.S. was 37.8 billion pounds, 1 percent above the April-June period last year. The average number of milk cows in the U.S. during the April-June quarter was 10.3 million head, down 1 percent from the same period in 1987.

U.S. JUNE EGG PRODUCTION DOWN 2 PERCENT

U.S. egg production totaled 5.52 billion during June 1988, down 2 percent from the 5.62 billion produced a year ago. Production included 4.82 billion for table eggs and 703 million for hatching eggs. The total number of layers during June averaged 269 million, down 3 percent from the 276 million a year ago. June egg production per 100 layers was 2054 eggs, compared with 2033 in June 1987.

All layers in the U.S. on July 1, 1988 totaled 267 million, compared with 275 million a year ago. The 267 million layers consisted of 230 million for table or commercial type eggs and 36.9 million for hatching type eggs. Rate of lay per day on July 1, 1988 averaged 68.3 eggs per 100 layers compared with 68.2 on July 1, 1987 and 68.5 on June 1, 1988.

JUNE MEAT PRODUCTION BELOW LAST YEAR

Montana slaughter plants produced 1.4 million pounds of red meat in June 1988. This production is up 10 percent from the previous month, but down 11 percent from the June 1987 production.

The number of cattle slaughtered, at 1,700 head, was down 200 head from last year, and total liveweight was down 22 percent. Hog slaughter, at 2,200 head, was up 200 head from last year, and total liveweight was 14 percent above last year.

Commercial red meat production for the **United States** in June 1988 totaled 3.32 billion pounds, up 7 percent from June 1987. January-June red meat production, at 19.3 billion pounds was up 3 percent from last year. The percentage changes from 1987 accumulated production by individual components were: Beef, unchanged; Veal, down 11; Pork, up 9; Lamb and Mutton, up 9. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

1/ Quarterly average includes dry cows, excludes heifers not yet fresh.
2/ Excludes milk sucked by calves.

CATTLE ON FEED UP 4 PERCENT

Cattle and calves **on feed** July 1, 1988 for slaughter in the **13 Quarterly States** totaled 8.99 million head, up 4 percent from July 1, 1987 and 13 percent above 1986.

The cattle on feed inventory included 5.77 million **steers and steer calves,** 3 percent above last year and 17 percent above 1986. This group represented 64 percent of the total July number on feed, compared with 65 percent last year and 62 percent in 1986. **Heifers and heifer calves** accounted for 3.18 million, up 5 percent from a year ago and up 6 percent from 1986.

Placements of cattle and calves on feed during the April-June quarter totaled 5.90 million, virtually unchanged from last year but 13 percent above the comparable period in 1986. **Other Disappearance** of 418 thousand head leaves **Net Placements** at 5.48 million.

Marketings of fed cattle for slaughter during April-June totaled 5.85 million, 4 percent more than 1987 and 1 percent above the same period in 1986. This is the largest second quarter marketings since 1987.

Cattle feeders **expect to market** 6.22 million head during the July-September quarter of 1988. This would be 3 percent more than the third quarter marketings in 1987 and 6 percent above 1986.

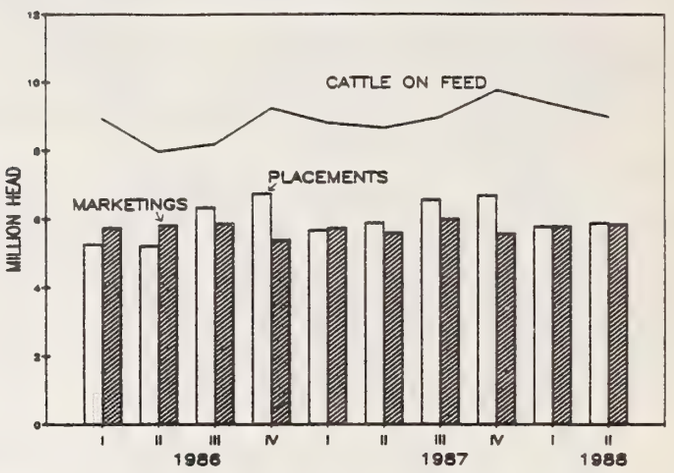
CATTLE ON FEED, PLACEMENTS, MARKETINGS
BY QUARTERS FOR 13 STATES



Cattle on Feed July 1, 1988 in the **7 Monthly States** totaled 7.42 million, 3 percent more than the previous year and 13 percent more than two years ago. **Placements** in feedlots during June totaled 1.37 million, 4 percent below last year but 18 percent above 1986. **Marketings** during June totaled 1.69 million, down 1 percent from June 1987 but up 3 percent from 1986. **Other Disappearance** during June was 68 thousand head, 22 percent below last year but 1 percent above 1986.

The **April-June Quarterly Marketings** for the 7 states, at 5.03 million were 6 percent higher than 1987 and 2 percent above 1986. This is also the largest second quarter marketings for the 7 states since 1978. Marketings for the 7 states during the April-June quarter accounted for 86 percent of the 13-state total. **Expected 7-state marketings** for the July-September 1988 quarter are estimated at 5.22 million, up 3 percent from 1987 and up 5 percent from 1986.

HOG INVENTORY UP 8 PERCENT

Inventory of all hogs and pigs in the U.S. on June 1, 1988 is estimated at 56.2 million head. This is 8 percent above a year ago and 15 percent above June 1, 1986. This is the highest June 1 inventory since 1983.

- Breeding inventory, at 7.53 million head, is 7 percent above last year and 17 percent above two years ago.

- Market hog inventory, at 48.7 million head, is 8 percent above a year ago and 15 percent above two years ago.

The 10 quarterly states, with 44.0 million head on June 1, 1988, are up 8 percent from last year and up 16 percent from two years ago. The December 1987-May 1988 U.S. pig crop was 46.6 million head, 8 percent above last year and 15 percent above two years ago.

Sows farrowing during this 6 month period, at 6.0 million, were 8 percent more than the previous year and 14 percent above two years ago. Pigs saved per litter was 7.77 compared with 7.79 record litter rate last year and 7.70 two years ago.

In the 10 quarterly states, the December-May pig crop was 36.3 million head, 9 percent above last year and 16 percent above two years ago. The December 1987-February 1988 pig crops, at 16.3 million head, was up 10 percent from a year ago and 15 percent above two years ago. The March-May pig crop of 20.0 million head was 7 percent above last year and 18 percent above two years ago.

SEVERE DROUTH IMPACTS NATION

The big news around Montana continues to be the drouth. The June 27 weekly crop-weather report shows crop and livestock conditions continue to deteriorate. Temperatures of 10 to 20 degrees above normal sucked available moisture from the soil and put crops and pastures under extreme stress.

Montana's forty-four weather stations recorded high temperatures ranging from 91 to 109 degrees last week. Precipitation was a half inch or less in the western two-thirds while the eastern third received little more than a few sprinkles. Grain crops and pastures are now rated 60 to 75 percent poor or very poor. This is in contrast to the same week a year ago when 85 percent of the crops were good to excellent.

We're getting a lot of calls asking about acreage losses. We're collecting survey information to assess the situation and will publish results on July 12. Unlike the '85 drouth, which was limited to mostly Montana, this year's extremely dry conditions are impacting farmers and ranchers nationwide.

We appreciate the excellent input from our voluntary crop and livestock reporters on the drouth situation. Their input helps us provide accurate, reliable information -- information that's vital to making decisions based on facts, not speculation.

FARM EXPENDITURES UP 3.9 PERCENT

Farm production expenditures totaled $110.1 billion in 1987, up 3.9 percent from $106.0 billion in 1986. Expenditures were higher for all major categories except feed which decreased 0.5 percent, interest which dropped 15 percent, and fuels & lubricants which decreased 7.3 percent.

Farm services including rent, the largest 1987 expenditures by farmers at $24.0 billion, accounted for 22 percent of the nation's production expenses. This level was 2.9 percent above 1986. Feed expenses totaled $14.9 billion and accounted for 13 percent of the U.S. total. Average expenditures per farm were $50,791, an increase of $2,815 from 1986.

Expenditures for **large farms** (sales over $100,000) averaged $258,711 and accounted for over 67 percent of the U.S. total. Purchases of farm services, feed, labor, and livestock & poultry were major expenses (nearly 60 percent of the total) for operations with sales over $100,000. The large farms accounted for more than one-half of the U.S. expenses for farm services, feed, labor, livestock & poultry, farm machinery, interest, and fertilizer.

Expenses for **medium-sized** farms (sales of $40,000 - $100,000) averaged $70,943 for 1987 and contributed 17 percent of the U.S. total. Leading expenditures for medium sized farms were farms services, feed, and farm machinery.

Expenditures for **small** farms (sales less than $40,000) averaged $15,887 and accounted for 16 percent of the nation's production expenses. The three leading expenditure categories for small farms were farm services, farm machinery, and feed.

Fact Finding for Agriculture

125th ANNIVERSARY OF AG STATISTICS :

FIRST CROP REPORT SHOWED DRY CONDITIONS, TOO

The **July Crop Report** is slated for release on **July 12th** and we'll include a summary in the next Reporter. The first crop report appeared 125 years ago, on July 10, 1863. Back then, the country was in the middle of the Civil War and they could not account for all states.

The report states... "The replies... were not as numerous in some of the States as was desirable. But the answers from the great grain-producing States of Ohio, Indiana, Illinois, Michigan, Wisconsin, and Iowa were full and satisfactory. It is due, too, that the promptness of the new and distant States of Minnesota and Kansas should be kindly acknowledged, and their example commended to States much nearer the capital."

Below are some excerpts from that first report showing crop conditions in 1863.

"Thus we see in Kansas... the entire returns represent an abundance of rain. So, too, but not quite to the same extent, are the reports from Missouri, of which, however, there are few on account of the war. But Iowa is the reverse of Missouri, reporting fifty-one counties very dry; Wisconsin has fourteen very dry, eleven dry against twelve favorable, and the entire returns from Minnesota exhibit every county as very dry.

"Why this remarkable difference between Kansas and Minnesota? Again: all the States lying east of the great lakes have had much more rain than those south of them during the first three weeks of June. Whence have these rains come? Were they produced by the cold west winds condensing the evaporation from the lakes?

"And why do Kansas and Missouri receive so liberally from the evaporations of the equator, whilst the States north of them have so little, and Minnesota none? The answer to these questions, to be understood, must be preceded by an explanation of that wonderful atmospherical machinery which the Creator has designed for the diffusion of heat and the distribution of moisture."

(Excerpts from "Monthly Report of the Condition of the Crops," U.S. Department of Agriculture, July 10, 1863.)

MAY RED MEAT PRODUCTION

Montana slaughter plants produced 1.3 million pounds of red meat in May 1988. This production is down 1 percent from last month, and down 11 percent from May 1987.

The number of cattle slaughtered, at 1,500 head, was down 300 head from last year, and total liveweight was down 20 percent. Hog slaughter, at 2,300 head was up 500 head or 31 percent from a year ago.

Commercial red meat production for the **United States** in May 1988 totaled 3.21 billion pounds, up 8 percent from May 1987. January-May red meat production, at 16.0 billion pounds, was up 3 percent from last year.

The percentage changes from 1987 accumulated production by individual components were: Beef, down 1; Veal down 12; Pork, up 9; Lamb and Mutton, up 9. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

SWEET CHERRY PROSPECTS DOWN

Montana's 1988 sweet cherry production is forecast to be 3 million tons, 21% less than a year ago. The production forecast is 88 percent larger than 1986.

For the **U.S.**, sweet cherry production is forecast to be 175.4 million tons, down 17% from last year, but 27 percent above 2 years ago.

CATTLE ON FEED IN 7 STATES UP 3 PERCENT FROM 1987

Cattle and calves **on feed** June 1, 1988, for slaughter market in the 7 States preparing monthly estimates totaled 7.81 million head, up 3 percent from a year ago and up 10 percent from June 1, 1986. This is the highest June total since 1978.

Marketings of fed cattle during May totaled 1.72 million, up 14 percent from last year and 5 percent above May two years ago. This is the highest number of fed marketings in May since 1972.

Placements of cattle and calves on feed in the 7 States during May totaled 2.17 million, up 9 percent from last year and up 24 percent from May 1986. This is the largest number of placements during the month since the seven state series began in 1972. **Net placements** of 2.03 million for May are 10 percent above last year and 25 percent above 1986.

Other disappearance totaled 141 thousand head, compared to 143 thousand during May 1987 and 132 thousand during May 1986.

EGG PRODUCTION REMAINS STEADY

Montana poultrymen produced 53 million eggs in the quarter ending May 31, 1988. The average number of layers on hand in the March through May period was up more than 1 percent from last year but a lower rate of lay kept production the same as in the 1987 quarter.

The **Nation's** laying flocks produced 17.4 billion eggs during the March through May quarter, down 1 percent from the corresponding quarter a year ago. Layers for the quarter averaged 275 million, down 2 percent from the 280 million a year earlier.

All layers on June 1, 1988, totaled 270 million, down more than 2 percent from a year ago. Layers on June 1 consisted of 233 million for table eggs and 37.5 million layers for hatching eggs. **Rate of lay** on June 1, for all layers, averaged 68.5 eggs per 100 layers, compared with 67.5 a year earlier.

MAY MILK PRODUCTION UP 1 PERCENT

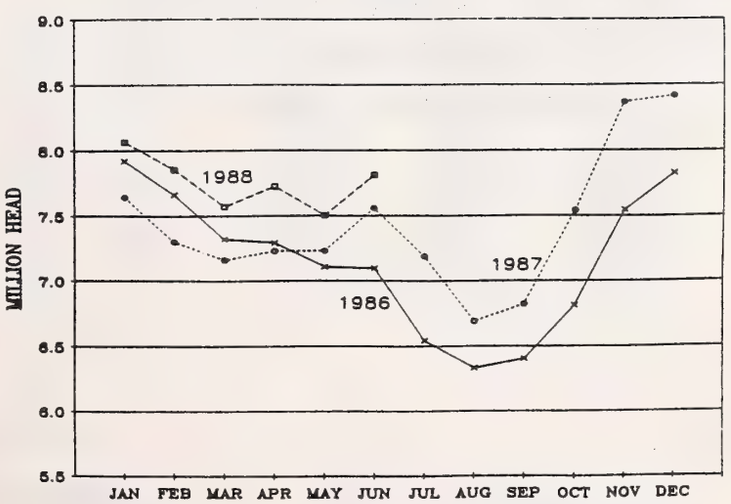
Milk production in the 21 selected States totaled 11.0 billion pounds, 1 percent above production in these same states for May 1987.

Production per cow in the 21 selected States averaged 1,280 pounds, 21 pounds more than May a year ago.

The **number of cows on farms** in the 21 selected States was 8.63 million head, 9 thousand more than April 1988 but 70 thousand less than May 1987.

During the January-March period, the 21 selected States produced 84.7 percent of the U.S. production. If the producers in the remaining 29 States not surveyed on June 1 followed the same pattern as the 21 States, the U.S. production would be 13.0 billion pounds for May 1988.

CATTLE ON FEED
7 STATES



JUNE PRICE INDEX SHARPLY HIGHER

The June 1988 index of prices received by **Montana** farmers and ranchers moved up 8 points from May.

The all products index at 159 percent of its 1977 average was pushed up by a 35 point increase in the all crops index. The livestock and livestock products index fell 17 points partly offsetting the strong gain shown by drought plagued crops.

Individual commodity prices are as follows: Winter Wheat at $3.30/bu. was up $.47; Durum at $5.85/bu. was up $2.41; Other Spring Wheat at $4.00/bu. was up $1.02 from May; Barley at $1.98/bu. was up $.35; Oats at $1.65/bu. was up $.08; All Hay at $60/ton was up $18.00. Livestock prices were all lower with Cows at $44.00/cwt, down $5.50; Steers and heifers at $72.20 were off $.90; Calves at $80.50 were down $3.80. Sheep moved down $2.00 to $23.00/cwt; Lambs dropped $12.20 to average $60.00. Hogs were down $2.00 at $38.40; Wholesale milk at $11.15/cwt. was down $.20; and Eggs were off 1 cent/doz. at $.36. Wool at $1.30/lb. was unchanged. Compared with last year, prices were higher except for cows, sheep, lambs, hogs, milk and eggs.

The June all farm products index of prices received by **U.S.** farmers increased 5 points from May to 139 percent of its January-December 1977 average. Higher prices for soybeans at $8.56, corn at $2.43, and wheat at $3.50 were partially offset by lower prices for cattle and peaches. The index was 9 points above a year ago.

Most grain prices moved up sharply in June, reflecting the widespread drought. The average soybean price was at the highest level since May of 1977 and the fifth highest on record. Corn and wheat also moved up sharply to the highest levels since August of 1985 and May of 1984, respectively.

CALL FOR HAY & PASTURE INFORMATION

Keith Kelly, Director of the Montana Department of Agriculture has announced that drought stricken farmers and ranchers who need hay or pasture, and those with hay for sale or pasture to rent, can make use of a central clearinghouse set up by the Montana Department of Agriculture.

Farmers and ranchers with a personal computer and telephone modem can place listings or inquiries on the Agricultural Marketing Bulletin Board (444-5411). Others can telephone the Agriculture Department's marketing program at 1-800-722-FARM.

Those with hay for sale should provide a listing that includes the quantity, location and type of hay, as well as the name of a person to contact and a telephone number. Listings for available pasture to rent should include the location and estimated animal unit months available for grazing. Those interested in buying hay or renting pasture can place an inquiry.

Wheat and Barley County Estimates for 1987 will be published soon. You may receive your copy by contacting:

1987 COUNTY WHEAT ESTIMATES

The 1987 wheat county estimates will soon be available for distribution. We're publishing the "all wheat" figures in this publication, but estimates by class and cropping practice are available from the office upon request.

These estimates are the only county figures published for Montana. They are based on an acreage and production survey conducted last fall. Nearly 5,800 questionnaires were tabulated including 3,900 completed by telephone to ensure better coverage in each county. Thanks to those who provided information!

JUNE 1 CROP PRODUCTION

Montana's winter wheat crop, hard hit by prolonged dryness, is expected to total 52.8 million bushels -- a third less than 1987. The forecast is based on June 1 conditions and is down 8 percent from May 1. The expected yield of 24 bushels per acre is 12 bushels less than last year, but still 8 bushels above the drouth plagued yield in 1985. Acres for harvest at 2.2 million is unchanged from a year ago.

Nationally, winter wheat production is forecast at 1.57 billion bushels as of June 1, 1988. This is slightly higher than the 1987 production, but down 3 percent from the May 1 forecast. Harvested area remains at 39.8 million acres, up 1 percent from last season. Yield prospects have declined to 39.4 bushels per acre, down 0.4 bushels from 1987 and 1.3 bushels per acre less than the May 1 forecast.

The next forecast of winter wheat production will be released on July 12 and will reflect conditions since June 1, which so far, have been mostly unfavorable. Barley production will also be included in the July 1 forecast.

MAY PRICES RECEIVED SLIGHTLY LOWER

The May 1988 index of prices received by **Montana** farmers and ranchers declined 3 points from April. The index at 152 percent of its January-December 1977 average is still 14 points above last year's level. The **all crops index** moved up 2 points from April, but the **livestock index** was down 9 points.

Individual commodity prices changed from April to May as follows: All Wheat advanced 6 cents per bushel as durum moved up 17 cents; other spring wheat increased 13 cents but winter wheat declined 2 cents; barley was up 6 cents; oats retreated 4 cents; alfalfa hay was up $1.00 per ton. The beef cattle composite average was down $2.50 per cwt. as steers and heifers fell off $1.60 and cows $.70; calves dropped $3.30 per cwt. Sheep were down $1.90 but lambs moved up $9.30 per cwt.

Hogs declined $.80 per cwt.; wholesale milk was off $.40 per cwt.; eggs were down 5 cents per dozen and wool was unchanged from the previous month.

Compared with last year most items were higher. Notable exceptions were: Oats, off 24 cents per bushel; Hay, down $3.00 per ton; Sheep, down $5.00 per cwt.; Hogs down $13.60 per cwt.; Milk, off 80 cents per cwt., and Eggs, down 3 cents per dozen.

The May all farm products index of **prices received by U.S. farmers** increased 4 points from April to 134 percent of its January-December 1977 average. Higher prices for hogs, soybeans, oranges, and broilers were partially offset by lower prices for tomatoes, onions, milk and upland cotton. The index was 6 points above a year ago.

A sharp increase in the price of barrows and gilts pushed the all hog price to the highest level since October last year. The May all cattle price increased to the highest level since May of 1979 but the calf price dropped from last month.

APRIL MANUFACTURED DAIRY

Montana dairy plants produced 153,000 gallons of ice cream during April 1988 -- a 35 percent increase from April 1987. Butter output totaled 112,000 pounds, down 17 percent from a year ago. Creamed cottage cheese production, at 286,000 pounds, was down 6 percent from last year.

U.S. butter production was 112 million pounds, 9 percent above April 1987, but 4 percent below March 1988. Creamed cottage cheese production was 54.9 million pounds, 6 percent below both April last year and last month. March ice cream production at 73.6 million gallons was down 6 percent from last year. There were 4.63 million gallons of sherbet produced, up 5 percent from April 1987.

RANGE & PASTURE CONDITION VERY POOR

Montana range and pasture feed condition was rated very poor on June 1, the lowest since the severe drouth of 1985. Rangelands in the northern third as well as the eastern third of the state went through the winter with little or no snowfall. With spring moisture very short, ranges and pastures in those areas are rated to be in severe drouth. By contrast, the west and southwest portions have good to excellent conditions while the central and south central is rated poor to fair. Grasshoppers also are hatching rapidly in some areas to put further stress on diminishing resources.

APRIL RED MEAT PRODUCTION DOWN 3 PERCENT

Montana slaughter plants produced 1.3 million pounds of red meat in April 1988. This production is down 3 percent from last month, and down 9 percent from the April 1987 production.

The number of cattle slaughtered, at 1,300 head, was down 500 head from last year, and total liveweight was down 11 percent. Hog slaughter, at 2,300 head was up 100 head from a year ago, and total liveweight was up 12 percent.

Commercial red meat production for the **United States** in April 1988 totaled 3.16 billion pounds, nearly the same as April 1987. January-April red meat production, at 12.8 billion pounds was up 1 percent from last year. The percentage changes from 1987 accumulated production by individual components were: Beef, down 2; Veal, down 14; Pork up 7; Lamb and Mutton, up 6. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

CATTLE ON FEED IN 7 STATES UP 4 PERCENT FROM 1987

Cattle and calves **on feed** May 1, 1988, for slaughter market in the 7 States preparing monthly estimates totaled 7.50 million head, up 4 percent from a year ago and up 6 percent from May 1, 1986.

Marketings of fed cattle during April totaled 1.61 million, up 5 percent from last year but 1 percent below April two years ago.

Placements of cattle and calves on feed in the 7 States during April totaled 1.53 million, down 9 percent from last year and down 2 percent from April 1, 1986. **Net Placements** of 1.39 million for April are 10 percent below last year and 4 percent below 1986.

Other Disappearance totaled 139 thousand head, compared to 139 thousand during April 1987 and 120 thousand during April 1986.

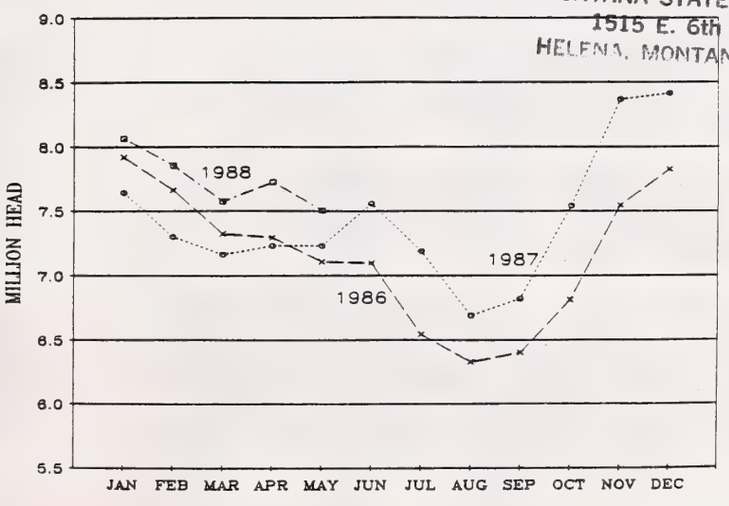
CATTLE ON FEED
7 STATES



MILK PRODUCTION, DISPOSITION and INCOME, 1987

Montana's dairymen produced 331 million pounds of milk in 1987, down 2 percent from 1986. The rate per cow, at 13,240 pounds, was 721 pounds above 1986. The annual average number of cows milked was 25,000 head, down 2,000 from a year earlier.

Cash receipts from marketings of milk during 1987, at $39.8 million, declined 4% from last year. The average return per cwt was $12.58, down 22 cents from the 1986 average. Marketings totaled 316 million pounds, down 2 percent from a year earlier.

Milk production for the **U.S.** decreased 1 percent in 1987 to 142 billion pounds. The rate per cow, at 13,786 pounds, was 526 pounds above 1986. The annual average number of cows at 10.3 million head was 4 percent less than the average in 1986.

Cash receipts from marketings of milk during 1987, at $17.7 billion showed no change in 1986 but was 2 percent below 1985. Producer returns averaged $12.64 per cwt, 5 cents above the 1986 average. Marketings totaled 140 billion pounds milk equivalent, 1 percent below 1986. Marketings include whole milk and producer-separated cream sold to plants and dealers as well as milk sold directly to consumers.

An estimated 2.20 billion pounds of milk were used on farms where produced, 9 percent less than during 1986. Calves were fed 69 percent of this milk with the remainder consumed in producer households as milk, cream and butter.

APRIL MILK PRODUCTION UP 2 PERCENT

Milk production in the 21 selected States totaled 10.6 billion pounds, 2 percent above production in these same States for April 1987.

Production per cow in the 21 selected States averaged 1229 pounds, 38 pounds more than April a year ago.

The number of cows on farms in the 21 selected States was 8.62 million head, 12 thousand less than March 1988 and 95 thousand less than April 1987.

During the January-March period the 21 selected States produced 84.7 percent of the U.S. production. If the producers in the remaining 29 States not surveyed on April 1 followed the same pattern as the 21 States, the U.S. production would be 12.5 billion pounds for April 1988.

AG SCIENTISTS NEEDED

Freshman college students this fall will be our agriculture scientists in the next century, and there won't be enough of them, says Kenneth Reisch, Associate Dean at Ohio State University College of Agriculture. He says it takes about 10 years for a college freshman to get a Ph.D. and a few more years to become an established scientist. That puts this fall's class beyond 2000 before they are productive scientists.

What's so disturbing is demonstrated in the enrollment at Ohio State, a typical good Land Grant University. In 1977 Ohio State had 3,174 undergraduates in agriculture; in 1987, just 1,675 -- a drop of 47%. That spells trouble for agricultural sciences, processing, and agribusiness, says Reisch.

What's the problem? A struggling farm economy, poor image, and a shift in population from rural to urban areas, says Reisch. Vocational Agriculture gives colleges a pipeline to rural areas, but there's no pipeline to urban areas -- and little understanding there of professional opportunities in agriculture. The Ohio State College of Agriculture mounted a campaign in 1984 to attract high-ability students who hadn't taken Voc Ag (non-traditional Ag enrollees), but so far only 5% of its non-traditional Ag students come from urban backgrounds.

APRIL EGG PRODUCTION and LAYER NUMBERS DOWN

U.S. egg production totaled 5.66 billion during April 1988, down 2 percent from the 5.79 billion produced a year ago. Production included 4.96 billion for table and 693 million for hatching eggs. The total number of layers during April averaged 274 million, down 2 percent from the 280 million a year ago. April egg production per 100 layers was 2,065 eggs, compared with 2,069 a year ago.

All layers in the U.S. on May 1, 1988 totaled 273 million, down 2 percent from the 279 a year ago. The 273 million layers consisted of 235 million for table or commercial type eggs and 37.1 million for hatching eggs. Rate of lay per day on May 1, 1988, averaged 68.1 per 100 layers, compared with 68.4 on May 1, 1987 and 69.5 on April 1, 1988.

Laying flocks in the 20 major egg production states produced 4.75 billion eggs during April, down 2 percent from the 4.84 billion produced a year ago. The number of layers averaged 229 million, down 2 percent from a year ago.

The 30 quarterly states estimates are based on month-to-month percent change in the 20 states making monthly surveys. These monthly states accounted for about 84 percent of the U.S. egg production and layer numbers during the 3-month period, December 1987 through February 1988.

MAY 1 POTATO STOCKS UP 20 PERCENT

Potato stocks on May 1, 1988, totaled 71.6 million cwt., up 20 percent from last year and 10 percent above two years ago. Stocks accounted for 21 percent of fall production in the 15 storage States compared with 19 percent a year ago. Storage is heaviest in the West where much of the crop is committed to processors. Several States are either finished or winding down shipping operations for the season.

The six **Western States** stored 55.5 million cwt of potatoes on May 1, up 17 percent from last year and 23 percent above two years ago. Idaho at 27.5 million cwt and California at 1.10 million cwt are the same as they were last year. **Montana** is winding down its seed deal with 300 thousand cwt left. Colorado stocks of 6.5 million cwt represents one-third of its production and were 53 percent above last year. Washington with 12.6 million cwt and Oregon with 7.50 million cwt, mostly for processing, are up 45 and 29 percent, respectively.

Disappearance from harvest to May 1 totaled 262 million cwt, up 6 percent from last year, but 6 percent below the 1985 crop. Shrinkage and loss accounted for 26.9 million cwt of this total, up 7 percent from last year's 25.1 million cwt, but 41 percent below two years ago when 45.6 million cwt were lost.

Processing plants used 111 million cwt of potatoes this year to date, up 5 percent from last year and 1 percent above two years ago. April processing took 12.5 million cwt, down 8 percent from last year and is the second consecutive month processing has fallen below year ago levels.

NUMBER OF WORKERS and WAGES UP

During the week of April 10-16, 1988, there were 2.98 million people working on farms and ranches in the United states. This number was up 5 percent from the 2.82 million workers during the comparable survey week in 1987. Included in the workforce were 1.32 million self-employed farm operators, 476,000 unpaid workers, and 958,000 workers hired directly by farm operators. Agricultural Service employees accounted for the remaining 224,000 workers. All categories of workers were up from the April 1987 survey week.

Hired farm workers received an average of $5.00 per hour during the April 1988 survey week, up 10 cents from a year earlier. Workers paid an hourly wage earned $4.78 per hour compared with $4.67 last April. Field and livestock workers earned $4.76 and $4.51, respectively. Last year they averaged $4.70 and $4.32.

Self-employed persons worked an average of 45.5 hours during the April 1988 survey week, up 1.9 hours from the comparable week in 1987. Unpaid workers averaged 36.4 hours, 0.3 hours more than last year. Hired workers put in 39.5 hours compared with 40.3 hours in April 1987.

Perquisites and other benefits such as housing and food were provided to 45 percent of the hired workers. Housing was provided to 13 percent of the workers, unchanged from last year.

THINGS ARE LOOKING UP FOR WHEAT

The expected **U.S. wheat carryover** on June 1 this year at 1.2 billion bu., is down 35% from the record carryover of 1.9 billion bu. on June 1, 1986. World wheat stocks will also be smaller on June 1, the first decline in 6 years.

U.S. wheat exports in the marketing year ending May 31 this year are expected to total 1.6 billion bu.--up 75% from 2 years ago, and the 2nd highest on record. The **U.S.** share of **world wheat trade** has grown from 29% 2 years ago to 42% this year. The U.S. has captured virtually all the 20-million-ton increase in world trade over the last 2 seasons.

We're also **using more wheat here at home.** Wheat used for food will reach 750 million bu. in this marketing year--a record. Total wheat use--at home and for export--will reach 2.7 billion bu. this marketing year--also a record. This record wheat use will exceed production by more than 600 million bu. this year. That's equivalent to the production of 16 million acres.

What about the **wheat marketing year starting June 1**? We'll likely harvest a winter wheat crop of about 1.62 billion bu. in 1988, with an expected yield of 40.7 bu. per acre -- the second highest on record. Total winter and spring 1988 wheat output could be about 2.17 billion bu., up 3% from 1987. Still, we're expecting to use 2.6 billion bu. of U.S. wheat at home and abroad in the year starting June 1. That's 450 million bu. more than we will likely harvest in 1988. That will cut U.S. carryover on June 1, 1989, to about 796 million bu.

Expected wheat carryover next June 1 is equal to 30% of use--the lowest stocks-to-use ratio since 1974. Good bottom line news for wheat growers: USDA projects 1988-89 prices at $2.80 to $3.20 per bu., compared with $2.55 in this current year ending May 31.

RAINS NEEDED

This week's crop weather report shows spring planting is virtually done -- 10 days to 2 weeks ahead of normal for this date. The big concern on everyone's mind is the moisture situation. Precipitation since April 1 has been below normal for about half of the weather stations.

Soil moisture is rated 57% short but is highly variable, depending upon location. The North Central and Eastern areas are hurting, but the rest of the state is currently in fairly good shape.

Winter wheat is rated over half poor to fair and about 46% good to excellent. Timely rains are needed to germinate and sustain growth of spring planted crops. Prospects deteriorated this last week because rain was too light and spotty to be of much help.

A look at the livestock situation shows about 60% of the cattle and sheep have been moved to summer range. Stockwater supplies are a problem in some areas.

MAY 1 WINTER WHEAT FORECAST

Montana's 1988 winter wheat production is forecast to be 28 percent under last year. Total production at 57.2 million bushels is based on conditions as of May 1. The expected yield of 26 bushels per acre is down 10 bushels from 1987, while acres for harvest at 2.2 million are unchanged from 1987. Recent rains have improved prospects since May 1, but much of the important winter wheat growing areas remain dry or have little moisture in reserve. The crop has been kept mostly in fair to good condition by cool weather in the drier areas.

Winter wheat production for the U.S. is forecast at 1.62 billion bushels, 4 percent more than 1987. Harvested area is placed at 39.8 million acres, up 1 percent. Yields average 40.7 bushels per acre, the second highest on record.

Kansas production at 357.2 million bushels is down almost 3 percent while Oklahoma's production at 181.3 million bushels is up almost 40%. The states of Washington, Oregon, Idaho, Montana, and California will produce 276 million bushels, down 16 percent from last year.

MARCH MANUFACTURED DAIRY

Montana dairy plants produced 156,000 gallons of **ice cream** during March 1988 -- a decrease of 13 percent from March 1987. **Butter** output totaled 131,000 pounds, down 13 percent from a year ago. **Creamed cottage cheese** production of 288,000 pounds was down 20 percent from last year.

U.S. butter production was 116 million pounds, 10 percent above March 1987, but 1 percent below February 1988. **Creamed cottage cheese** production was 58.6 million pounds, 3 percent below last March but 9 percent above February this year. March **ice cream** production at 76.4 million gallons was down 1 percent from last year. There were 4.49 million gallons of **sherbet** produced, up 19 percent from March 1987.

PASTURE & RANGE FEED CONDITION

Montana's range and pasture feed condition on May 1 is rated poor to fair and ranks among the lowest ratings on record for this early spring date. Both drouth and cold wether have been hard on pastures and ranges in much of the state. Timely rains are critical to the development of ample grazing for the coming year.

1/ District data funded by the Montana Wheat & Barley Committee.

MONTANA HAY STOCKS

Hay stocks on Montana farms as of May 1, were 1.2 million tons, down 9 percent from May 1, 1987. This year's carryover is about 28 percent of last year's production. The 1987-88 feeding season's weather was mild with little snowcover on winter grazing areas.

EGG RECEIPTS DECLINE

The value of Montana eggs produced in 1987, at $8.5 million, declined 9 percent from a year earlier. Egg production was 205 million dozen, up 2 percent from 1986, but reduced prices more than offset the increased output. Eggs averaged 50 cents per dozen in 1987 while the average price in 1986 was 56 cents per dozen.

Chicken sold in 1987, excluding broilers, brought producers $149,000. The average price received, mostly for spent laying hens, was 6 cents per pound.

The combined value of production from eggs, broilers and turkeys and the value of sales from chickens, in 1987 for the U.S. was $11.2 billion, down 10 percent from the $12.4 billion in 1986. Of the combined total, 55 percent was from broilers, 29 percent from eggs, 15 percent from turkeys, and 1 percent from other chickens. Value of egg production in 1987 was $3.18 billion, down 9 percent from the $3.51 billion in 1986. Eggs averaged 54.9 cents per dozen in 1987 compared with 61.6 cents in 1986.

2/ Includes death and other losses during the 12 month period.

APRIL
PRICES RECEIVED SLIGHTLY HIGHER

Mid-April crop prices were generally above prices received for March. Advances were led by hard spring and durum wheat which were up 18 cents, while winter wheat was up a nickel. The all barley price was down 9 cents, the only crop showing a decline. Alfalfa hay, $41.00 per ton, remains at last months level which was the lowest price since November 1978.

Cattle prices for April 15th were stronger when compared with March, while calves were off 30 cents. Hogs were down 20 cents and the limited sales of sheep and lambs showed a sharper decline. Milk, eggs and wool all were down from last month, but wool at $1.53 is well above the $1.00 received in April 1987.

The April 1988 index of prices received by Montana farmers and ranchers, at 161 percent of its January-December 1977 average, advanced 1 point from March. The index was 18 points above April 1987.

The April all farm products index of prices received by U.S. farmers was unchanged from March at 130 percent of its January-December 1977 average. Prices were higher for soybeans, cattle, hay, and oranges and were lower for lettuce, eggs, milk and strawberries. The index was 5 points (4.0 percent) above a year ago.

The April index of prices paid by U.S. farmers for commodities and services, interest, taxes, and farm wage rates was 168 percent of its 1977 average. The index was 3 points (1.8 percent) above January 1988 and 6 points (3.7 percent) above April a year ago. Higher prices for feeder pigs, fertilizer, ag chemicals, tractors, and other machinery contributed most to the increase from January.

QUARTERLY AGRICULTURE SURVEYS

Just another form to fill out or a phone survey to answer after a hard day's work? The answer is an obvious yes, but with that "yes' a farm operator should know that this is the most important survey he could participate in during the coming year.

Over **70,000 farmers** across the country provide basic information that keeps the wheels of agriculture rolling smoothly for everyone from seed dealers to exporters. Decisions in marketing whether it's for wheat, beef cows or seed potatoes will eventually depend on the basic farm level data provided on a **Quarterly Agricultural Survey.** The survey is the **bench mark** that producers and others watch to identify trends in acreage, production, stock levels, farrowing intentions and livestock inventories.

A little **background information** about how the survey is done should help in understanding why it has such an impact. Like many "polls" the survey uses a statistical sample which is designed to make estimates about the general population. In the case of next month's June Agriculture Survey, the sample of farm operators will provide an indication of what crops have been planted and how much grain is stored on farms in Montana and the U.S.

The **survey design** provides accuracy at the state level within 5 percent of the actual value. At the national level the accuracy is within 1 percent. To minimize the sampling error, farms in the state are grouped by size and/or commodities present on the farm. Farms which have large acreage, storage capacity or livestock inventory have a higher probability of being selected. Large operations represent about 10 percent of the total sample. The remaining 90 percent represent the "average farms" in the state.

Continued in next column

The Quarterly Agricultural Survey will **collect data** on crops, grain storage and hogs during June, September, December and March. The cattle surveys are done in January and July. Smaller operations should only be sampled two or three times during the year. Because the largest operations are few in number they may be contacted every quarter. Their contribution to agricultural production cannot be measured by statistical means and must be added to the expanded data from smaller farms. Every effort is made to minimize the number of contacts made asking for survey information.

Normally, farm operators are mailed a letter prior to the survey. The letter explains the purpose of the survey and asks for cooperation. It also points out that all information reported is confidential, protected by federal statutes and will only be used in combination with other reports.

Yes, the Quarterly Agricultural Survey is just another survey, but as the source for the closely watched **"Crop Report"** or **"USDA Hog Report,"** it's importance can't be ignored.

MONTANA SHEEP & LAMB LOSSES – 1987

Montana sheepmen lost 137,000 sheep and lambs to weather, predators, disease and other causes in 1987, 4 percent more than a year earlier. The 1987 losses were valued at $8.4 million, an increase of 32 percent from the previous year.

Predators caused a $2.3 million loss, non-predator factors caused losses of $4.8 million and losses due to unknown causes were $1.3 million. Coyote predation remained the single largest cause of death with a $1.6 million loss, which is 19 percent of the total value of death losses.

There were 30,500 lambs killed by all predators, down 13 percent from last year. Sheep killed by predators totaled 6,400, down 11 percent.

Lambs lost to weather, disease, and other non-predator causes totaled 48,500, up 17 percent from 1986. Sheep losses to non-predator factors totaled 31,300, 3 percent more than last year.

There were 13,000 lambs lost to unknown causes, up 24 percent from 1986, and losses of sheep to unknown causes were 7,300, the same as last year.

If you would like additional published data on predator losses, call or write our office.

APRIL 1 POTATO STOCKS

Western states potato stocks were set at 78.7 million cwt, 10 percent above last year and 12 percent above two years ago. **Idaho** stocks of 40.0 million cwt were the same as last year. **Washington** and **Oregon** were up 20 and 22 percent, respectively. **Colorado** stocks of 8.60 million cwt were 37 percent above last year. **California** storage was the same as last year and **Montana** gained 4 percent.

Disappearance from harvest to April 1 in the 15 major states totaled 228 million cwt, up 7 percent from last year but 5 percent below the 1985 crop. **Shrinkage and loss** accounted for 24.5 million of this total, up 5 percent from last year's 23.3 million cwt but 40 percent below two years ago when 40.4 million cwt were lost.

Processing claimed 99.0 million cwt of potatoes so far this crop year, up 7 percent from last year and 2 percent above two years ago. March processing used 13.8 million cwt, down 10 percent from last year.

HELENA, MONTANA 59620

MARCH RED MEAT PRODUCTION DOWN 6 PERCENT

Montana slaughter plants produced 1.4 million pounds of red meat in March 1988. The current production is up 19 percent from last month, but down 6 percent from March 1987.

There were 1,400 cattle slaughtered compared with 1,700 head slaughtered a year earlier. Total liveweight of the cattle slaughtered was down 14 percent from last year. Hog slaughter, at 2,500 head, was up 200 head compared with March 1987; total liveweight was up 7 percent.

Commercial red meat production for the **United States** in March 1988 totaled 3.35 billion pounds, up 5 percent from March 1987. January-March red meat production, at 9.67 billion pounds, was up 2 percent from last year. The percentage changes from 1987 accumulated production by individual components were: beef, down 1; veal, down 13; pork, up 7; lamb and mutton, up 12. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

1987 MEAT ANIMALS PDI

Montana's total marketings of meat animals decreased slightly during 1987 to 1,111.0 million pounds, 3 percent below the 1,145.1 million pounds marketed in 1986. Cash receipts from these marketings, at $690.4 million, increased nearly 19 percent from a year earlier.

The increase in cash receipts were led by cattle receipts of $631.8 million, up 18% from last year. Total hog cash receipts increased 44% from last year to $35.3 million in 1987 and total sheep receipts were $23.3 million, an increase of 17 percent.

The U.S. total marketings of meat animals increased slightly during 1987 as decreased cattle marketings were offset by larger hog and sheep marketings. With higher prices received for cattle, hogs and sheep, the resulting total cash receipts jumped to $44.7 billion, up 14 percent from 1986.

The percentage breakdown of contributions to total U.S. cash receipts from marketings of meat animals by species in 1987 were: cattle and calves, 76 percent; hogs and pigs, 23 percent; sheep and lambs, 1 percent.

VOTING ON BEEF REFERENDUM

The U.S. Department of Agriculture has issued a final rule governing the procedures for conducting the Beef Referendum as authorized by the Beef Promotion and Research Act of 1985.

Referendum **voting will be conducted in county Extension offices** during normal business hours on **May 10, 1988.**

All cattle producers who owned or acquired cattle and importers of cattle, beef or beef products during the period of October 1, 1986, through March 31, 1988, are eligible to vote. This also includes, 4-H, FFA and other youth who owned cattle during the designated time period.

The Agricultural Stabilization and Conservation Service will count ballots, determine the eligibility of challenged voters and ballots and report Referendum results.

MONTANA MILK PRODUCTION, JAN-MAR 1988

Montana dairymen produced 84 million pounds of milk in the first quarter of 1988, an increase of 11 percent from a year earlier, but unchanged from the last quarter of 1987. This is the 3rd consecutive quarter that Montana milk production has exceeded the previous year's output. In those 3 quarters, all milk cows have remained unchanged at 25,000 head while production per cow, now at 3,350 pounds, has moved upward in relation to a year earlier.

Grain and other concentrates fed to milk cows April 1, 1988 were unchanged from January 1 at 15.5 pounds per cow. The cost of that feed moved up 20 cents per cwt. from January, averaging $6.40 per cwt.

The quarterly production of milk **for the U.S.** was 36.1 billion pounds, 4 percent above January-March 1987. The average number of cows in the U.S. during the January-March quarter was 10.3 million head, 1 percent below January-March 1987, and was about the same as October-December 1987.

MARCH EGG PRODUCTION DOWN 1 PERCENT

U.S. egg production totaled 5.96 billion during March 1988, down 1 percent from the 6.02 billion produced a year ago. Production included 5.26 billion for table and 707 million for hatching eggs. The total number of layers during March averaged 278 million, down 2 percent from the 282 million a year ago. March egg production per 100 layers was 2147 eggs, compared with 2132 in March 1987.

All layers in the U.S. on April 1, 1988 totaled 275 million, compared with 282 million a year ago. The 275 million layers consisted of 238 million for table or commercial type eggs and 36.9 million for hatching type eggs. Rate of lay per day on April 1, 1988 averaged 69.5 eggs per 100 layers the same as on April 1, 1987 and 69.1 on March 1, 1988.

Laying flocks in the 20 major egg production states produced 5.00 billion eggs during March, down 1 percent from the 5.05 billion produced a year ago. The number of layers during March averaged 232 million, compared with 235 million a year ago.

The 30 quarterly states estimates are based on month-to-month percent change in the 20 states making monthly surveys. These monthly states accounted for about 84 percent of the U.S. egg production and layer numbers during the 3-month period, December 1987 through February 1988.

CATTLE ON FEED

Cattle and calves on feed April 1, 1988 for slaughter in the **13 quarterly states** totaled 9.37 million head, up 6 percent from April 1, 1987 and 5 percent above 1986.

The cattle on feed inventory included 6.08 million **steers** and **steer calves**, 7 percent above last year and 9 percent above 1986. This group represented 65 percent of the total April number on feed, unchanged from last year but up 2 percentage points from 1986. **Heifers** and **heifer calves** accounted for 3.25 million, up 6 percent from a year ago and down 2 percent from 1986.

Placements of cattle and calves on feed during the January-March quarter totaled 5.80 million, up 2 percent from last year and 10 percent above the comparable period in 1986. Other disappearance of 390 thousand head leaves net placements at 5.41 million.

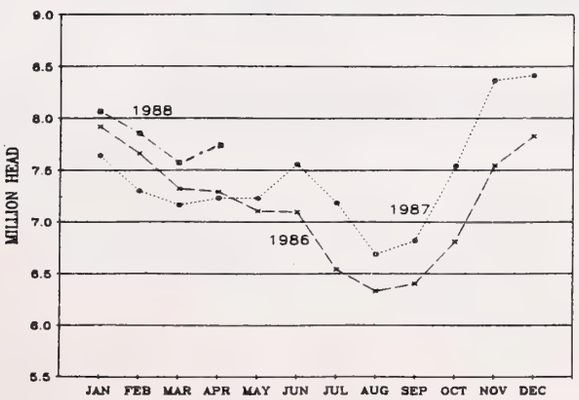
Marketings of fed cattle for slaughter during January-March totaled 5.81 million, 1 percent more than both 1987 and 1986.

Cattle feeders **expect to market** 5.93 million head during the April-June quarter of 1988. This would be **6 percent** more than the second quarter marketings in 1987 and **2 percent** above 1986.

Cattle on feed April 1, 1988 in the **7 monthly states** totaled 7.73 million, 7 percent more than the previous year and 6 percent more than two years ago. **Placements** in feedlots during March totaled 1.83 million, 7 percent above last year and 11 percent above 1986. **Marketings** during March totaled 1.57 million, up 1 percent from March 1987 and down 1 percent from 1986. **Other disappearance** during March was 106 thousand head, 19 percent above last year and 23 percent above 1986.

The **January-March quarterly marketings** for the 7 states, at 4.86 million were fractionally higher than 1987 and 1 percent above 1986. Expected 7-state marketings for the April-June 1988 quarter are estimated at 5.05 million, up 6 percent from 1987 and up 3 percent from 1986.

CATTLE ON FEED
7 STATES



VALUE OF U.S. FARMLAND REBOUNDS

This year's report on farmland values was recently released by USDA. It held mostly good news for farmers and ranchers. Montana's farmland value averaged $164 per acre as of February 1, 1988, down 2 percent from a year earlier. Even though any decline may be discouraging to producers, most are optimistic that recovery is on the way. Just a year ago, values were down a whopping 18 percent in Montana, so this year's 2 percent decline shows values have definitely leveled off.

U.S. farmland values are also encouraging. Results of the 1988 survey peg U.S. prices at $564 per acre, up 3 percent from a year ago. This is a turnaround from last year when U.S. values were down 8 percent. A look at values by state shows recovery has moved from the East Coast westward. Land values in most Eastern states through the Dakotas, Nebraska and Kansas were above year earlier levels. However, recovery has not yet reached the Western states. We're optimistic the a turnaround will be forthcoming.

FEBRUARY SLAUGHTER DOWN 11 PERCENT

Montana slaughter plants produced 1.1 million pounds of red meat in February 1988. This production is down 11 percent from the previous month and is down 11 percent from February last year.

The number of cattle slaughtered, at 1,200 head, was down 400 head from last year, and total liveweight down 23 percent. Hog slaughter, at 2,100 head, was up 200 head compared with one year ago; total liveweight was up 13 percent.

Commercial red meat production for the United States in February 1988 totaled 3.07 billion pounds, up 7 percent from February 1987. January-February red meat production, at 6.31 billion pounds, was nearly the same as last year. The percentage changes from 1987 accumulated production by individual components were: beef, down 2; veal, down 14; pork, up 5; lamb and mutton, up 2. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

1987 WOOL PRODUCTION DOWN SLIGHTLY

Montana wool growers produced 5,193,000 pounds of wool in 1987, down less than 1 percent from 1986. Number of sheep and lambs shorn, at 525,000 head, was up 5 percent.

Average fleece weight was 9.9 pounds compared with 10.5 pounds the previous year.

The 1987 output represents the 5th consecutive year in which production fell below the previous year. It is a mere 14 percent of the peak production of 38.2 million pounds shorn in 1931. Since 1931, it has been mostly down hill for wool output as the number of sheep and lambs shorn fell from 3.9 million to slightly more than one-half million.

In the last 56 years, average fleece weight has not changed much, ranging from a low of 9.1 pounds in 1947 to a high of 10.6 in 1985.

FEBRUARY MANUFACTURED DAIRY

Montana dairy plants produced 94,000 gallons of **ice cream** during February 1988 -- a decrease of 17% from February 1987. **Butter** output totalled 131,000 pounds, down 5% from a year ago. **Creamed cottage** cheese production of 282,000 pounds was up 5% from last year.

U.S. butter production in February was 117 million pounds, 20 percent above February 1987 but 6 percent below January 1988.

Creamed cottage cheese production was 53.7 million pounds, 2 percent above February 1987 and 5 percent above January 1988.

February ice cream production at 63.2 million gallons, was down 4 percent from last year. There were 3.17 million gallons of sherbet produced, up 8 percent from February 1987.

1988 PLANTING INTENTIONS

Montana farmers intend to plant 4,575,000 acres of **spring grains** in 1988 - a decline of 12 percent from last year. All grain crops, including the 2.3 million acres of **winter wheat** seeded last fall which equals the plantings for last year's crop, shows a total decrease in grain acreage of 8 percent.

Producers intend to seed 2.0 million acres of **hard red spring wheat**, and 200,000 acres of **durum**, compared with 2.4 million acres of hard red spring wheat planted in 1987 and 195,000 acres of durum.

Barley growers intend to plant 2.05 million acres in 1988, down 11 percent from last year's acreage of 2.3 million. **Oats** seeded are expected to increase 6 percent to 250,000 acres, while **corn** plantings are expected to decline 6 percent to 75,000 acres. **Dry bean** acreage is expected to be down 14 percent. **Hay** producers expect to harvest 2.3 million acres or 5 percent more than in 1987.

For the nation, **winter wheat** planted acres are estimated at 48.6 million acres, down slightly from 1987. Durum wheat farmers expect to seed 3.73 million acres, up 12 percent. **Other spring** wheat acreage is expected to total 12.8 million acres, off 7 percent from a year ago.

Barley producers intend to plant 10.3 million acres in 1988, down 7 percent from last year. **Oat** producers intend to plant 16.3 million acres in 1988, down 9 percent from 1987.

Dry edible bean intentions call for 1.38 million planted acres in 1988, down 23 percent from last year and 18 percent below two years ago. **Corn** growers intend to plant 66.9 million acres in 1988, up 2 percent from last year.

MARCH 1 GRAIN STOCKS - MONTANA & U.S.

Montana wheat stored in all storage positions totaled 116.0 million bushels, down 4 percent from March 1, 1987. March 1 stocks are 35 percent below the December 1 stocks. There were 60.0 million bushels of winter wheat, 4 percent less than last year and 56.0 million bushels of spring wheat, also down 4 percent from March 1, 1987.

Barley stocks in all positions were 52.0 million bushels, down 31 percent from last quarter. Barley stocks were not included in the March 1, 1987 survey.

In the U.S., all wheat stocks in all positions March 1, 1988 is estimated at 1.91 billion bushels, down 15 percent from March 1, 1987. Farm stocks are 737 million bushels, down 7 percent from a year ago. Off-farm stocks total 1.17 billion bushels, 20 percent less than last March 1. The indicated December-February disappearance from all positions is 597 million bushels, 41 percent higher than the disappearance during the comparable quarter last year.

Durum wheat in all storage positions March 1, 1988 is estimated at 107 million bushels, down 17 percent from March 1, 1987. Farm stocks are placed at 64.0 million bushels, or 60 percent of all durum stocks. The on-farm stocks are 12 percent less than last March 1, while off-farms stocks are down 25 percent. The indicated quarterly disappearance from all positions is 13.8 million bushels, 45 percent less than the disappearance from the comparable period a year ago.

Corn stored in all positions on March 1, 1988 is estimated at 7.63 billion bushels. Of the total stocks, 4.42 billion bushels were stored on the farm and 3.21 billion bushels were stored off the farm. The December 1987-February 1988 indicated disappearance is 2.14 million bushels, 4 percent above the December 1986-February 1987 disappearance of 2.06 billion bushels.

MARCH AG PRICES

Montana farm commodity prices generally moved down from February to March. **All wheat** averaged a nickel lower at $2.76, and **beef cattle** were down 20 cents per cwt. at $70.40. **Steers and heifers** slipped 70 cents at $78.00; **calves** were off 10 cents at $90.40. **Cow** prices continued to move up, registering a 90 cent gain at $52.50. This is $5.10 above March 1987, but still $5.90 below the record high price set in May 1979.

Sheep prices, (mostly slaughter ewes) were down $4.00 per cwt. at $29.50. **Lambs** were down $3.20 from last month at $77.00. **Hogs** moved up $2.50 to average $42.60. **Wholesale milk** averaged $12.05 per cwt., down 31 cents from February. **Eggs** and **wool** were higher than last month.

Alfalfa hay averaged $41.00 per ton, down $3.00 and is the lowest since November 1978. **Barley** was the only grain price moving up from February at $1.78.

The March 1988 index of prices received by Montana farmers and ranchers was unchanged from the previous month at 161 percent of its January-December 1977 average. The livestock index held steady with last month, while the crops index was down 1 point. All crop items declined except barley which was up one cent per bushel.

The March all farm products index of prices received by **U.S.** farmers was unchanged from February at 130 percent of its January-December 1977 average. Higher prices were received for lettuce, cattle, eggs, and broilers while prices for hogs, milk, wheat, and sweet corn were lower. The index was 9 points above a year ago.

Calf prices dropped slightly from February to March, but were at the second highest level since June 1979. The price of all beef cattle was the highest since May 1979. Hog and wheat prices declined from a month earlier, while corn prices were up slightly.

HIGHLIGHTS:

Quarterly Egg Production
Cattle on Feed
1987 Red Meat Production
March Potato Stocks
February Milk Production
Wheat Utilization

DECEMBER-FEBRUARY EGG PRODUCTION DOWN FROM 1987

Montana poultry flocks produced 49 million eggs in the December-February quarter, down 4 percent from the same quarter last year, but up 2 percent from the previous quarter. The average number of layers on hand during the recent quarter was down about 1 percent from a year ago. The average rate of lay per 100 layers was 68.3 eggs, down from 71.5 eggs a year ago.

The nations's laying flocks produced 17.6 billion eggs during the December 1987 through February 1988 quarter, up 2 percent from the corresponding quarter a year ago. Production included 15.6 billion for table eggs and 2.05 billion for hatching eggs. Layers for the quarter averaged 283 million, up fractionally from the 282 million a year ago. February 1988 consisted of 29 days, compared with 28 days a year ago.

All layers in the U.S. on March 1, 1988 totaled 280 million, compared with 282 million a year ago. The 280 million layers consisted of 243 million for table or commercial type eggs and 37.4 million for hatching type eggs. Rate of lay per day on March 1, 1988 averaged 69.1 eggs per 100 layers compared with 68.0 for both March 1, 1987 and February 1, 1988.

Laying flocks in the 20 major egg production states produced 4.70 billion eggs during February, up 5 percent from the 4.48 billion produced a year ago. The number of layers during February averaged 236 million, unchanged from a year ago.

CATTLE ON FEED

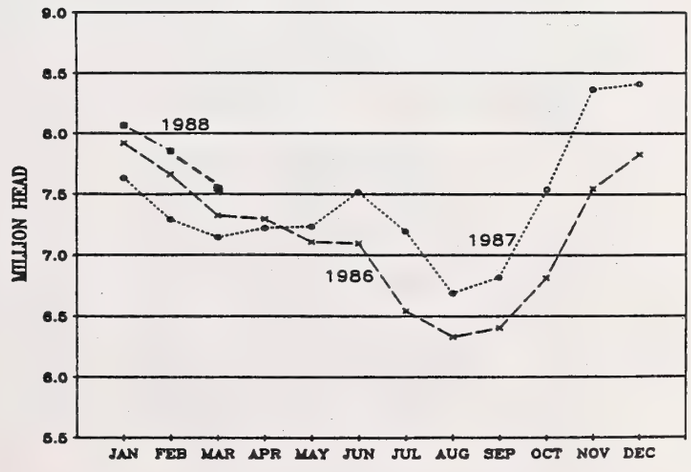
Cattle and calves on feed March 1, 1988 for slaughter market in the 7 States preparing monthly estimates totaled 7.57 million head, up 6 percent from a year ago and up 3 percent from March 1, 1986.

Marketings of fed cattle during February totaled 1.53 million, 3 percent above last year and 4 percent above February two years ago.

Placements of cattle and calves on feed in the 7 States during February totaled 1.37 million, down 5 percent from last year but up 12 percent from February 1986. Net placements of 1.24 million for February are 7 percent below last year but 10 percent above 1986.

Other disappearance totaled 126 thousand head, compared with 105 thousand during February 1987 and 92 thousand during February 1986.

CATTLE ON FEED
7 STATES



1987 RED MEAT PRODUCTION

Montana's 1987 red meat production totaled 18.2 million pounds, down 12 percent from 1986. There were 22,200 head of cattle slaughtered, down 21 percent from a year earlier. Slaughter of 1987 hogs totaled 27,200 head compared with 28,500 in 1986. There were 2,900 head of sheep and lambs slaughtered equalling last year's output.

Red meat production for the United States during 1987 totaled 38.7 billion pounds, down 2 percent from 1986. Production included beef, veal, pork, lamb and mutton slaughter in commercial establishments and on farms.

Beef production was 23.6 billion pounds, down 5 percent from 1986. Veal production was 429 million pounds, down 18 percent from 1986. Pork production was 14.4 billion pounds, up 2 percent from 1986. Lamb and Mutton production totaled 316 million pounds, a decrease of 6 percent from 1986. Lard production, 862 million pounds, was down 1 percent.

1/ Includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms. 2/ Includes total beef, veal, pork, lamb and mutton, excludes farm slaughter. 3/ Months may not add to totals due to rounding.

Commercial cattle slaughter during 1987 totaled 35.6 million head, down 4 percent from 1986, with Federal inspection comprising 96.7 percent of the total. Calf slaughter, at 2.81 million head, down 17 percent from the previous year with 95.2 percent under federal inspection. Hog kill totaled 81.1 million head, up 2 percent from 1986, with federal inspection comprising 97.3 percent. Commercial sheep and lamb slaughter 5.20 million head, down 8 percent from 1986 with federal comprising 97.0 percent.

Average live weight of cattle slaughtered commercially in 1987 was 1105 pounds, up 5 pounds from 1986. The calf average live weight was 249 pounds for 1987, a decrease of 2 pounds from the previous year. Average live weight for hogs increased 1 pound to 247. Sheep and lambs averaged 119 pounds live weight, down 2 pounds from 1986.

MARCH POTATO STOCKS

The potato stocks inventory for Montana on March 1, 1988 was 1.9 million cwt., 1 percent above last year's inventory.

Stocks in storage represent 84 percent of the total 1987 production.

Potato stocks in the 15 fall storage states totaled 138 million cwt on March 1, 1988. This is up 7 percent from last year but 1 percent below two years ago. Remaining stocks account for 41 percent of fall production this year compared with 42 percent a year ago. Holdings in most states are above a year ago; notable exceptions are Idaho, Michigan, Wisconsin, and Pennsylvania, where stocks are below last year.

Western states potato stocks totaled 98.5 million cwt on March 1, up 6 percent from last year and 8 percent above 1986. Idaho stocks at 49.0 million cwt were down 2 percent but each of the other 5 western states were above a year ago. Colorado gained 29 percent; California was up 4 percent. Washington and Oregon were up 12 and 17 percent, respectively.

Disappearance from harvest to March 1 totaled 195 million cwt this year, up 9 percent from last year. Shrinkage and loss at 22.2 million cwt was up 4 percent from last year's 21.3 million cwt, but nearly 40 percent below two years ago when losses were 34.6 million cwt. February disappearance of 29.2 million cwt was 13 percent above last year.

Cumulative processing this year totaled 85.2 million cwt in the 8 major states, up 11 percent from the same period a year ago. February processing of 13.3 million cwt was 5 percent above a year ago.

PROTEIN: COSTS VARY BY PRODUCT

You're short of money between paychecks, and you're wondering how to save on food and get the most protein for your money? Well, have an egg sandwich on enriched white bread, spread on a little peanut butter, and have a strip of beef liver. Now you've just eaten four of the cheapest sources of protein around -- ranging from 20 to 29 cents per 20 grams of protein.

That doesn't appeal to you, and you want to move up? Okay, get some ready-to-cook whole chicken, canned tuna, ground beef, or turkey. That's the next cheapest quartet -- ranging from 32 to 35 cents per 20 grams of protein.

Think you can pay a bit more? Okay, the next quartet: Fluid whole milk, ground chuck, chicken breast, or beef chuck roast. Cost -- 35 to 50 cents for 20 grams of protein.

Now your paycheck has come in and money's no object? All right, buy pork sausage, center cut pork chops, sliced bacon, or beef rib roast. You'll get 20 grams of protein for 91 cents to $1.16. How much is 20 grams of protein? That's about one-third of the daily amount recommended for a 20-year-old man.

But let's say you like sausage, chops, bacon, and rib roast better than more economical peanut butter, bread, and liver? Go ahead and buy what you like to eat. Enjoy it! Our food is the best buy around. You can't top it anywhere in the world.

FEBRUARY

MILK PRODUCTION UP 6 PERCENT

Milk production in the 21 selected states totaled 9.74 billion pounds, up 6 percent above production in these states in February 1987. The extra day in February 1988 would account for about a 4 percent increase with the same daily rate.

Production per cow in the 21 selected states averaged 1126 pounds for February, 74 pounds more than February a year ago.

The number of cows on farms in the 21 selected states was 8.65 million head, 18 thousand less than January 1988 and 117 thousand less than February 1987.

During the October-December 1987 period the 21 states accounted for 85.0 percent of the U.S. production. If producers in the remaining 29 states not surveyed on March 1 followed the same production pattern as the 21 states, the U.S. production would be 11.5 billion pounds for February 1988.

AG HEALTH BEING CHECKED

What are the real and latest facts on the financial health of American agriculture? Currently, the National Agricultural Statistics Service and the Economic Research Service are surveying a 1% sample of the Nation's farmers to get the answers. We call it the Farm Costs and Returns Survey.

Trained interviewers are asking farmers about their income, expenses, cost of production, rental arrangements, debtors, interest payments, and their balance sheets. The aim: Find what kinds of farmers and farm sizes are under financial stress and where they are geographically.

Interviewers will ask farmers about seeding rates, fertilizer rates, custom work, and field practices. They'll ask about soil preparation, planting, cultivating, spraying, harvesting, crop losses, and marketing -- to capture the costs of every operation.

What will happen when it's all done in mid-March? Computers will crunch the numbers, and the paper from each survey will be destroyed so it can't be traced to any one farmer. Then the combined results will be published for all to see.

NATIONAL AGRICULTURE DAY:

A Salute to Our Nation's Agriculture

Agriculture Day (March 20, 1988) is an annual recognition of the economic activity (**farmers, ranchers,** and **businesses**) that provide the U.S. food supply. We have the **most plentiful** and **dependable** supply of **nutritious** food, in the **greatest variety,** for the lowest average share of people's incomes, of **anywhere in the world.**

o **"Agriculture"** in the broad sense encompasses production inputs made for **farmers, farming itself,** and the **processing, transportation, and retailing** that move food and fiber from the farm to consumers. That economic activity **employs 21 million people** (17.9% of U.S. work force) and accounts for 16.6 percent of the Nation's Gross National Product.

o **2.2 million** American farmers **provide** food and fiber for **251 million** people (203 million in the U.S. and 48 million overseas).

o **One** American farmer provides food and fiber **for 114** people -- 92 in the U.S. and 22 overseas. That figure of 114 is up from 73 in 1970 and 46 in 1960.

o A farmer spends $484 to produce the food for one person.

o People in the U.S. can **purchase** their **food** for an average outlay of **14.4 percent** of their **after-tax income.** That is down from about 20 percent 25 years ago. Eating at home takes 9.7 percent of after-tax income; eating out takes 4.7 percent.

o **Farmers get 25 cents** of the consumers' food dollar spent for food raised on U.S. farms, **down from 32 cents** 20 years ago.

MDA's NEWEST SERVICE: AGRICULTURAL MARKETING BULLETIN BOARD

The Montana Agricultural Statistics Service reports are now available on the Montana Department of Agriculture's Agricultural Marketing Bulletin Board (AMBB). The reports which are prepared for hard copy distribution will now be loaded on the AMBB for immediate access by the public.

The AMBB carries information regarding current market quotes, both daily and weekly, from markets around the state and in northern Wyoming. These reports cover major farm commodities, cattle, and sheep. With the addition of the statistical information, producers and buyers of agricultural products will be better able to track the trends of the markets and act according to these trends. The AMBB also includes a listing of over 300 agricultural businesses from beef packing plants to processors of huckleberry candy, state agricultural organization annual meetings, a buy/sell section and a message board.

The Agricultural Marketing Bulletin Board has been operating for three months and has attracted over 150 users. It was developed in response to a growing need to find new markets and enhance existing markets for the wide range of agricultural products grown and made in Montana. The market and statistical reports were added at the public's request, and have been enthusiastically received.

To access the AMBB and the new Agricultural Statistics Service reports you need only have a computer with a phone modem. Communication with the system is as simple as making a phone call. To link with the computer dial (406)-444-5411. Your modem should be set to the following protocol: Databits - 8, Parity - None, Stop Bits - 1, Duplex - Full, Emulation - None.

For further information concerning the AMBB call (406) 444-2402 or write:

JANUARY MANUFACTURED DAIRY

Montana dairy plants produced 97,000 gallons of **ice cream** during January -- a **13 percent increase** from January 1987. **Butter** output totaled 113,000 pounds, **down 41 percent** from a year ago. **Creamed cottage cheese** production, at 270,000 pounds was **down 6 percent** from last year.

U.S. butter production in January was 125 million pounds, **14 percent above** both January and December 1987. **Creamed cottage cheese** production was 51 million pounds, **8 percent below** January 1987 but **3 percent above** December. **January ice cream** production at 54.5 million gallons, was **down 5 percent** from last year. There were 2.69 million gallons of **sherbet** produced, **down 8 percent** from January 1987.

JANUARY
MILK PRODUCTION UP 3 PERCENT

Dairymen in **Montana** produced 331 million pounds of milk in 1987, down 2 percent from the 338 million pounds produced in 1986. The average number of cows milked during the year decreased from 27,000 head in 1986 to 25,000 cows in 1987. The average rate of production per cow increased to 13,240 pounds from 12,519 pounds per cow in 1986. There were 2,500 farm operations in Montana that had one or more milk cows on hand during the year, excluding cows used to nurse calves. The number of operations in the state were unchanged from the previous year.

Milk production for the **U.S.** during 1987 totaled 142 billion pounds, down 1 percent from 1986. The output per cow, at 13.8 thousand pounds, was 526 pounds above 1986 rate. The annual average number of cows was 10.3 million head, 4 percent below the 1986 average. The number of farm operations in the U.S. with one or more milk cows on hand during the year, excluding cows used to nurse calves, was 233,320 farms, down from 252,910 in 1986.

JANUARY MILK PRODUCTION UP 3 PERCENT

Milk production, during January 1988, in the **21 selected States** totaled 10.2 billion pounds, 3 percent above production in these same States in January 1987.

Production per cow in the 21 selected States averaged 1177 pounds for January, 54 pounds more than January 1987.

The number of cows on farms in the 21 selected States was 8.67 million head, unchanged from December 1987 but 138 thousand head below January 1987.

During the October-December 1987 period the 21 States produced 85.0 percent of the U.S. production. If producers in the remaining 29 States not surveyed on February 1 followed the same production pattern as the 21 States, then the U.S. production would be 12.0 billion pounds for January.

FEBRUARY 1988 PRICES RECEIVED

Montana farmers and ranchers received a **mix of higher and lower prices** for the month of February. **Winter wheat, durum wheat, spring wheat,** and **oat prices** continued to strengthen for the month, while **barley** prices declined slightly.

Alfalfa hay and **other hay** prices **plunged** to the lowest level in 10 years. For **livestock, steers** and **heifer** prices have climbed to a **record high** of $83.00 per cwt, and **cow, beef cattle,** and **calf** prices are the highest since the spring of 1979. **Lamb** and **hog** prices are down from last month's levels. **Wool** prices moved up a dime and are at a **record high** $1.10 per pound.

The **February index of prices received** by Montana farmers and ranchers for all farm products, at 160 (1979 = 100), was **2 points higher** than the January index, **and 19 points higher** than February 1987. The **all crops index,** at 116, was **1 point above** last month's level, and **9 points higher** than last year. The **livestock and products index,** at 201, was **5 points higher** than last month and **30 points higher** than one year ago.

In the **U.S.,** the **all farm products index** of prices received by farmers for February **decreased 1 point** from the previous month to 130 percent of its 1977 average. Compared with a year earlier the index was up 8 points.

The **February all crops index** was 110, **down 5 points** from January but **up 11 points** from a year earlier.

The **livestock and products index,** at 150, was **up 3 points** from January and **6 points above** February a year ago. The increase from last month was due to higher prices for cattle, calves, and hogs which more than offset declines in milk, poultry, and egg prices.

JANUARY

EGG PRODUCTION UP 1 PERCENT

U.S. Egg production totaled **5.96 billion** during **January 1988, up 1 percent** from the 5.92 billion produced a year ago. Production included 5.26 billion for table and 701 million for hatching eggs. The total **number of layers** during **January** averaged 283 million, **unchanged** from a year ago. January egg production per 100 layers was 2109 eggs, compared with 2089 in January 1987.

All layers in the U.S. on February 1, 1988 totaled **283 million,** compared with 284 million a year ago. The 283 million layers consisted of 244 million for table or commercial type eggs and 38.1 million for hatching type eggs. **Rate of lay** per day on February 1, 1988 averaged **68.0 eggs** per 100 layers compared with 66.9 on February 1, 1987 and 68.1 on January 1, 1988.

Laying flocks in the **20 major egg production States** produced **5.01 billion eggs** during January, **up 1 percent** from the 4.95 billion produced a year ago. The number of layers during January averaged 237 million, compared with 236 million a year ago.

The **30 quarterly States** estimates are based on month to month percent change in the 20 States making monthly surveys. These monthly States accounted for about 83 percent of the U.S. egg production and layer numbers in 1987.

LOOKING AHEAD AT AGRICULTURE

A short twelve years from now it will be the year 2000 -- the 21st century! What will agriculture be like then? During this century we've gone from horse and buggy days to air-conditioned cars, trucks and tractors.

There has been a dramatic increase in agricultural productivity. One farmer now produces enough to feed himself and 113 others. The number of U.S. farms has decreased from over 6 million to about 2 million today!

What can we look for in the future? Will changes occur as rapidly as in the past? How fast research develops new techniques and farmers and ranchers adopt new innovations depends on the profitability opportunities in agriculture.

We certainly can see some exciting research breakthroughs as we learn more about biotechnology and particularly the capabilities of genetic engineering. We're likely to see more productive livestock and crops, but what we eat isn't expected to change very much. But, if changes in lifestyles are as dramatic as they have been during the last century we're in for some surprises.

HIGHLIGHTS:

JANUARY SLAUGHTER
CATTLE ON FEED
POTATO STOCKS
HONEY PRODUCTION
ANNUAL AVG. WAGE RATES

JANUARY SLAUGHTER DOWN 9 PERCENT

Montana slaughter plants produced 1.3 million pounds of red meat in January 1988. This production is down 16 percent from the previous month and down 9 percent from the January 1987 production.

The number of cattle slaughtered, at 1,400 head was down 500 head from last year, and total liveweight down 14 percent. Hog slaughter, at 2,400 head, was up 200 head compared with one year ago, and total liveweight was up 14 percent.

Commercial red meat production for the United States in January 1988 totaled 3.24 billion pounds, down 5 percent from January 1987. Beef production, at 1.94 billion pounds, was down 8 percent from last year. Pork production, at 1.24 billion pounds, was unchanged from a year earlier. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

CATTLE ON FEED

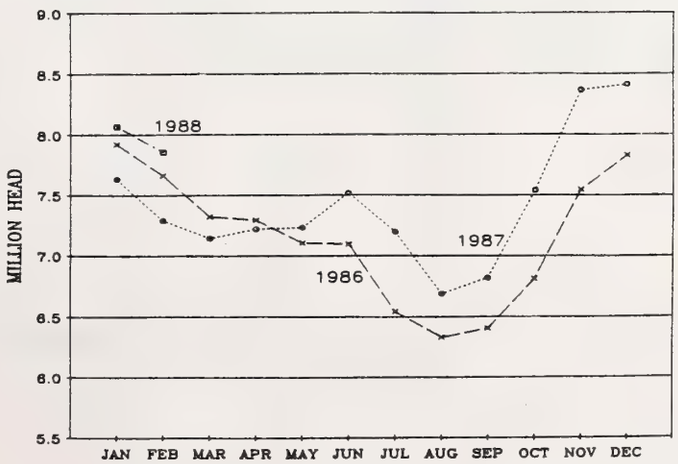
Cattle and calves on feed February 1, 1988 for slaughter market in the 7 states preparing monthly estimates totaled 7.86 million head, up 8 percent from a year ago and up 3 percent from February 1, 1986.

Marketings of fed cattle during January totaled 1.76 million, 2 percent below last year but 1 percent above January two years ago.

Placements of cattle and calves on feed in the 7 states during January totaled 1.66 million, up 4 percent from last year and up 5 percent from January 1986. Net placements of 1.55 million for January are 6 percent above last year and 4 percent above 1986. This is the largest January placements since 1974.

Other disappearance totaled 111 thousand head, compared with 127 thousand during January 1987 and 87 thousand during January 1986.

CATTLE ON FEED
7 STATES



ANNUAL AVERAGE WAGE RATES

The U.S. 1987 annual average rate for **all hired workers** was $4.87 compared with $4.70 the previous year. The combined annual rate for **field and livestock workers** averaged $4.57 per hour, 15 cents an hour more than in 1986. In Oregon and Washington (Pacific Region), field and livestock workers averaged $5.26 per hour, up 74 cents from the previous year. Increased wage rates for **hourly and piece rate workers** during the October 1987 survey week accounted for most of this increase.

The average rate for field and livestock workers in Colorado, Nevada, and Utah (Mountain II Region) dropped 90 cents from the previous year to $4.29 per hour in 1987. This drop was due mainly to a lower proportion of salaried (other methods of pay) livestock workers in the 1987 survey sample.

NEW EMPHASIS ON SUSTAINABLE AGRICULTURE

Recent news from USDA says more **research and education** will be aimed at low-input, **alternative farming methods.** What does this mean? It means USDA will be examining ways to produce food and fiber in a way that is **harmless to humans** and the **environment** and **sustainable for future generations.** It probably means a reduction in the use of chemical pesticides and commercial fertilizers.

It means going back and **revisiting methods of farming** many of us learned in high school vocational agriculture classes -- using **legume crop rotations** and **animal manure.** Researchers are focusing on **biological methods** to control weeds, diseases, insects and other pests.

State Experiment Stations are expected to take a leadership role along with the **Extension Service** and **USDA agencies.** Dust off those old textbooks folks, maybe they're **not obsolete** after all!

The annual average for California, Florida, Hawaii, The Southern Plains, and Mountain III regions is based on data collected for Jan, Apr, July, and Oct. The annual average for the remaining regions and the U.S. is based on data collected for Apr, Jul, and Oct 1987.

HONEY PRODUCTION UP 38 PERCENT

Montana Honey Production for 1987 (for producers with five or more hives) amounted to **9.69 million pounds**, up 38 percent from 1986. The State's beekeepers had **95,000 producing colonies**, down 14 percent from 1986. **Average yield** was 102 pounds compared with 64 pounds the year before. **Stocks on hand** December 15 were 1,066,000 pounds or 11.0 percent of production. The **price received** for the 1987 honey crop averaged 46 cents per pound.

Nationally, honey production for 1987 amounted to **227 million pounds**, up 13 percent from 1986. The number of **colonies producing** this amount was **3.19 million**, compared with 3.21 million in 1986. The 1987 **average yield** per colony of 71.1 pounds represents a 14 percent increase over 1986. **Stocks** were at 33.1 million pounds or 14.6 percent of production. In 1986 stocks were 27.2 million pounds or 13.6 percent of production. **Prices** for the 1987 honey crop averaged 50.7 cents per pound, down 0.4 cents from the 1986 price of 51.1 cents per pound.

MONTANA
POTATO STOCKS DOWN 2 PERCENT

The total **potato stocks** inventory for Montana on February 1, 1988 was estimated at **2.0 million cwt.**, 2 percent below last year's inventory. Stocks in storage represents 84 percent of the total 1987 production.

February 1, 1988 **potato stocks** for the U.S. are estimated at 167 million cwt, **up 8 percent** from last year but 3 percent below two years ago. Half of fall potato production is still on hand this year, the same proportion as a year ago. **Storage** potatoes are 81 percent **russet** by type, 16 percent **white**, and 3 percent **red.**

Potato stocks in the **6 western states** stand at 117 million cwt, **8 percent more** than last year and 5 percent more than two years ago. **Idaho** stocks of 57.0 million cwt are even with last year and slightly above two years ago. **Washington** at 28.3 million cwt stored and **Oregon** with 14.2 million cwt are up 16 and 12 percent, respectively. **Colorado**, with 12.2 million cwt was up 25 percent. **California** stocks totaling 3.10 million cwt gained 15 percent over a year ago; while **Montana** shed holding 2.00 million cwt were 2 percent below last year. Of the 6 western states, only California had fewer potatoes this year than were on-hand two years ago.

Disappearance in the 15 states from harvest time to the present totaled 166 million cwt, **up 9 percent** from last year, but was 4 percent short of two years ago. **Shrinkage and losses** totaling 20.5 million cwt are **up 4 percent** from the 19.6 million cwt last year but are 30 percent below two years ago when losses were 29.2 million cwt. As a percent of disappearance, losses are running 12.3 percent this season compared with 12.8 percent last year and 16.9 percent for the 1985 crop.

JANUARY CATTLE INVENTORY

Montana's January 1, 1988 inventory of **cattle and calves**, at 2,350,000 head, is down 2 percent from January 1, 1987. The annual survey of Montana's ranches and farms shows **total cattle on hand** January 1 down for the fourth consecutive year and the lowest since January 1, 1963. The record high inventory was set in 1974 with 3,380,000 head.

Beef cows that have calved declined 2 percent to 1,275,000, but **replacement heifers** at 255,000 head, increased 9 percent from a year ago. **Milk cow** numbers increased to 25,000 from 24,000 on hand January 1, 1987. **Milk cow replacement heifers** at 7,000 head was unchanged from last year. Other heifers weighing 500 pounds or more increased 10 percent to 156,000 head. There were 254,000 **steers** weighing 500 pounds or more, an increase of 11 percent from 1987. **Calves** weighing less than 500 pounds, at 306,000 head, are down 20 percent from last year. There were 1,280,000 calves born in Montana in 1987, 7 percent fewer than were born during 1986.

All cattle and calves in the **United States**, as of January 1, 1988, totaled 99.0 million head, down 3 percent from the 102 million on January 1, 1987 and 6 percent below the 105 million two years ago. This continued the recent downward trend in cattle inventories begun in 1983 and was the first inventory below 100 million since 1961.

All cows and heifers that have calved, at 43.3 million, were down 2 percent from 44.3 million a year ago, down 3 percent from 44.8 million two years ago and the lowest since 1959.

The **1987 calf crop** was estimated at 40.0 million, down 3 percent from 1986 and 2 percent from 1985.

JANUARY SHEEP INVENTORY

There were 538,000 **sheep and lambs** on hand in Montana on January 1, 1988. This was 3 percent above last January's inventory. The **average value** of the sheep increased to $99.50 from $82.00 per head in 1987.

Ewes 1 year old or older increased 3 percent to 380,000 head, while **ewe lambs** over 3 months of age, at 106,000 remained unchanged from a year earlier. **Ram and wether lambs** 3 months plus dropped to 5,000 head compared with 11,000 last year.

Sheep and lambs on feed went up sharply to 35,000 head compared with 23,000 being fed January 1, 1987. This year's **lamb crop** of 440,000 lambs docked or branded is down 2 percent from the 1986 crop.

All sheep and lambs inventory in the **United States** on January 1, 1988 totaled 10.8 million head, up 4 percent from the 10.3 million head of a year earlier. The **value** of sheep and lambs on hand January 1, 1988 totaled $969 million, up 24 percent from a year earlier. The **average value per head** was $89.90, up $14.20 from a year earlier.

Stock sheep inventory increased to 8.99 million head on January 1, 1988, up 2 percent from 8.83 million last year. **Ewes** one year old and older, at 7.08 million head, increased 3 percent from a year earlier. **Ewe lamb** inventory on January 1, 1988 totaled 1.27 million head, down 2 percent from January 1, 1987.

The **1987 lamb crop** of 7.23 million head decreased 2 percent from the 1986 lamb crop. The **1987 lambing rate** was 106 per 100 ewes one year old and older, compared with 108 in 1986 and 103 percent in 1985.

DECEMBER RED MEAT PRODUCTION

Montana slaughter plants produced 1.5 million pounds of red meat in December 1987. This production is down 1 percent from the previous month and down 10 percent from the December 1986 production.

The number of cattle slaughtered, at 1,800 head, was down 500 head from last year, and total liveweight was down 20 percent. Hog slaughter, at 2,600 head, was up 200 head from last year, and total liveweight was 13 percent higher than a year ago.

Commercial red meat production for the United States in December 1987 totaled 3.38 billion pounds, up 4 percent from December 1986. January-December 1987 red meat production, at 38.5 billion pounds, was down 2 percent from last year. The percentage changes from 1986 accumulated production by individual components were: beef, down 3; veal, down 17; pork up 2; lamb and mutton, down 6. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

DECEMBER MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 71,000 gallons of ice cream during December -- a 49 percent decline from December, 1986. Butter output totaled 157,000 pounds, up 3 percent from one year ago. Creamed cottage cheese production, at 273,000 pounds was down 8 percent from last year.

U.S. butter production in December was 109 million pounds, 8 percent above December 1986 and 24 percent above November 1987. Creamed cottage cheese production was 49.4 million pounds, 4 percent below December 1986 and November 1987. December ice cream production at 60.1 million gallons was up 3 percent from last year. There were 3.06 million gallons of sherbet produced, up 1 percent from December 1986.

POTATO STOCKS UNCHANGED FROM 1987

The total potato stock inventory for Montana on January 1, 1988 was estimated at 2.1 million cwt., the same as a year earlier. Stocks in storage represents 89 percent of total 1987 production. January 1, 1988 potato stocks for the U.S. are estimated at 196 million cwt, up 8 percent from last year, but 3 percent below 1986. Stocks account for 59 percent of fall production this year - the same percent as last year. Storage is made up of 79 percent russet, 17 percent white, and 4 percent red potatoes.

Six western states stored 134 million cwt of potatoes on January 1, 1988, up 9 percent from last year and 4 percent above two years ago. Each of the western states had more potatoes in storage than last year, except Montana. Idaho stocks of 65.0 million cwt are up 3 percent from last year. Stocks in Washington totaled 32.9 million cwt, up 18 percent; while Colorado storage of 14.1 million cwt was up 20 percent. Oregon, with 16.1 million cwt, was up 8 percent; California was up 11 percent; and Montana was the same as last year.

Disappearance from harvest to January 1 in the 15 stocks states totaled 138 million cwt, 9 percent above last year but 3 percent below two years ago. Shrink and loss totaled 18.1 million cwt, up 4 percent from last year, but 27 percent below the 1985 frost damaged crop.

MAJOR SURVEY ON FARM FINANCIAL CONDITIONS BEGINS THIS WEEK

The fourth annual Farm Costs and Returns Survey, a major nationwide survey on costs of production and financial conditions throughout the farm sector, will begin this week and continue into late March. The 294 Montana farms and ranches selected for interviews have already been notified by letter. Across the nation, 24,000 farmers and ranchers will be contacted for survey interviews.

Interviewers will be collecting data on farm expenses, finances, capital purchases, and costs of production for 1987. The information will be used to determine farm production expenditures, measure farm income, and assess farm sector debts, assets, and cash flow -- key indicators of the economic well-being of farmers.

Survey findings will also be used to estimate costs and returns for Montana barley. USDA will publish the results of the survey in various reports scheduled for release beginning this summer.

CROP VALUES

A look at Montana's final 1987 crop production and value figures shows why farmers are a bit more optimistic this year. The value of all primary Montana crops totaled over $836 million in 1987, up 14 percent from 1986 and a whopping 69 percent above the drouth plagued 1985 crops.

Although the values for the last couple of years are impressive, they are well below 1981, '82 and '83 when crop values exceeded a billion dollars a year. Why the big drop in values for recent years? Production has been good for the last couple of years but prices are down. For example, all wheat averaged $2.69 during 1987 -- over a dollar a bushel below 1982.

Even though prices for most farm products are well below the levels of 1982, they are up from a year ago. Prices for all 1987 crops with the exception of hay, potatoes and dry beans were up. We're competing well on the world market as exports are up and price prospects are looking good. Let's hope things are turning around!

EGG PRODUCTION UP 2 PERCENT

Montana laying flocks produced 205 million eggs in 1987, 2 percent more than 1986 production. The average number of layers in flocks during 1987 was 789,000 birds compared with 790,000 birds a year earlier. The annual average production per layer on hand in 1987 was 260 eggs, up from 254 eggs per layer in 1986.

U.S. egg production during the year totaled 69.5 billion eggs, up 2 percent from the 1986 production of 68.4 billion eggs. Layer numbers during 1987 averaged 280 million, up 2 percent from 1986.

MILK PRODUCTION INCREASED 4 PERCENT

Montana's October-December milk production, at 84 million pounds, was 4 percent higher than the same period last year. Average milk production per cow, at 3,360 pounds, compares with 3,240 pounds per cow a year earlier. The 25,000 cows milked remained the same as the previous year.

Montana dairymen fed an average of 15.5 pounds of grain and concentrates per head per day, up from 14.5 pounds last year. The cost per hundredweight of this feed was $6.20, down 25 cents from a year ago.

The quarterly milk production for the U.S. was 34.9 billion pounds, 3 percent above October-December 1986. The average number of milk cows in the U.S. during the October-December quarter was 10.4 million head, 2 percent below a year earlier.

JANUARY PRICES RECEIVED

Montana farmers and ranchers received higher prices for most commodities in January 1988. Lamb prices at $83.00 per cwt have hit an all-time high. Average prices for steers and heifers at $79.80, is the highest since April 1979, and is the second highest price on record. Prices for sheep, hogs, beef cattle, and cows also strengthened. Crop prices, except durum wheat and barley, gained over last month's levels.

The January Index of All Farm Products for Montana, at 155, is 5 points higher than last month, and 18 points higher than last year.

The All Crops Index, at 116 is 1 point lower than last month, but 6 points higher than last year.

Livestock and Products Index, at 190, increased 11 points over last month, and is 28 points higher than one year ago.

Nationally, the All Farm Products Index of Prices Received by Farmers for January increased 3 points from the previous month to 130 of its 1977 average. Compared with a year earlier the index was up 9 points.

The Livestock and Products index, at 146, was up 5 points from December and 4 points above January a year ago. The increase from last month was due to higher prices for cattle, calves, hogs, broilers, and eggs. The All Crops Index was 114, up 1 point from December and up 14 points from a year earlier.

MONTANA CROP SEASON IN REVIEW

Montana's 1987 crop season started out with little or no precipitation during the winter months, but with good soil moisture carryover. As a result, the winter wheat crop came through the winter in good condition with little freeze or wind damage. The snowpack was only one-third of normal, and warm winds during late April dried soils. The early, dry spring pushed crop planting to an early finish. May was a hot, dry and windy month, prospects looked dim until good rains came the end of the month. However, grasshoppers hatched to plague crops in many areas and irrigation water was in short supply.

Frequent and timely showers during June, July and August provided good crop development. The excessive moisture slowed crop maturity and hindered harvest. Malting barley lost quality because of late rains and the sweet cherry crop was severely damaged.

Dry weather returned in early September which allowed a timely harvest. Winter wheat seeding was also completed early. Dry topsoil during the fall and early winter gave concern over emerged winter wheat but provided good grazing prospects.

Crop yields during 1987 for most crops were some of the best on record.

MONTANA HAY STOCKS HIGHER

Stocks of hay on Montana farms and ranches on December 1, totaled 4.8 million tons, 9 percent more than last December. Production of hay was nearly 3 percent less than a year ago. but a mild, open fall lowered hay feeding requirements prior to December 1.

WINTER WHEAT SEEDINGS DOWN 4 PERCENT

Montana farmers planted 2.2 million acres of winter wheat this past fall for harvest in 1988 -- down 4 percent from last year's 2.3 million acres. During the 5 year period, 1977-81, Montana farmers averaged 2.85 million acres of winter wheat. The next five years, 1982-86, the average was 2.46 million. The downward trend has been influenced by farm programs, several years of drouth, and an increase in spring wheat plantings.

The 1988 crop planting emerged to good stands, but soils have been dry most of the fall and early winter. However, warm temperatures and lack of wind has prevented damage. Presently, the crop is in fair to good condition.

The U.S. winter wheat seedings for 1988 harvest totals 48.3 million acres, off 1 percent from 1987. Acreages are generally down from last year in states west of the Mississippi and up east of the Mississippi. This is the lowest seeded level in 10 years.

NOVEMBER MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 75,000 gallons of ice cream during November -- a 36 percent decline from November 1986. Butter output totaled 141,000 pounds, down 11 percent from one year ago. Creamed cottage cheese production at 277,000 pounds was up 5 percent from last year.

U.S. butter production in November was 88.2 million pounds, 10 percent above November last year but 2 percent below October 1987. Creamed cottage cheese production was 51.2 million pounds, about the same as November 1986 but 7 percent below October 1987.

November ice cream production, at 58 million gallons was unchanged from last year. There were 2.83 million gallons of sherbet produced, up 10 percent from November 1986.

MONTANA

GRAIN STOCKS HIGH

Montana's wheat and barley stocks remained at near record levels on December 1, although disappearance has been heavy since September 1. Wheat stocks in all positions are down 22 percent from September while barley stocks have fallen 20 percent. Nearly 84 percent of the disappearance in wheat stocks since September 1, have been from farm storages.

Wheat stocks are 9 percent more than a year ago. There is no comparable barley stocks estimate for last year.

The higher wheat stocks level should give Montana farmers an advantage this coming year because global stocks are declining and the U.S. should gain a larger share of the export market.

Over half of Montana's 23,300 farmers and ranchers were contacted during December and early January to finalize state and county crop figures and to count livestock by classes.

We appreciate the courtesy and excellent cooperation you have provided to our field and telephone interviewers. We hope 1988 is an outstanding year for Montana agriculture!

Thank you!

Lyle Pratt

MONTANA HOG INVENTORY UP 21 PERCENT

The inventory of hogs and pigs in Montana on December 1, 1987 was estimated at 230,000 head, up 21 percent from a year ago. The December inventory is the largest since 250,000 were on hand in 1980. Market hogs, estimated at 200,000 head, are up 18 percent from last year, while breeding hogs at 30,000 are up 43 percent. The total pig crop for 1987 was 394,000 head, up 22 percent from last year.

Nationally, the U.S. inventory of all hogs and pigs is estimated at 53.8 million head on December 1, 1987. This is 6 percent above a year ago and 3 percent above December 1, 1985.

-- Breeding hog inventory, at 7.02 million, is 5 percent above last year and 4 percent above two years ago.

-- Market hog inventory, at 46.8 million, is 6 percent above a year ago and 3 percent above two years ago. The U.S. pig crop for 1987 totaled 87.8 million head, 7 percent above 1986 and 2 percent above the 1985 pig crop.

-- December 1986 - May 1987 pig crop, estimated at 43.1 million head, is up 7 percent from the comparable period a year earlier and 1 percent above the comparable 1985 period.

-- June-November 1987 pig crop, estimated at 44.7 million head, is 6 percent above June-November last year and 3 percent above the June-November 1985 crop.

PRICES RECEIVED GENERALLY LOWER IN DECEMBER

The prices received by Montana farmers and ranchers were generally lower in December primarily because of softer grain and hay prices. However, the average price for steers and heifers, at $77.00, is the highest since September 1979. Higher cow marketings reduced the price level for beef cattle. Prices for durum, spring wheat, barley, hay, sheep, lambs and hogs declined, while winter wheat, oats, and calve prices advanced.

The December All Farm Products Index, at 147, is 4 points lower than last month, but 20 points higher than last year.

The Livestock and Products Index, at 174, is 7 points lower than last month, but 27 points higher than last year's level.

The All Crops Index stands at 117, 1 point lower than last month, but 11 points higher than last year.

NOVEMBER RED MEAT PRODUCTION

Montana slaughter plants produced 1.5 million pounds of red meat during November. Production was 7 percent less than the October production but about the same as last year during November.

Cattle slaughter was 1800 head, down 14 percent from last year. Total liveweight of cattle slaughtered was 1.95 million pounds, down from 2.12 million pounds last year. Hog slaughter was up 25 percent, 2500 head compared with 2000 head last year. Both cattle and hogs showed increases in the average liveweight per head slaughtered.

Commercial red meat production for the United States in November 1987 totaled 3.20 billion pounds, up 7 percent from November 1986. January-November red meat production, at 35.1 billion pounds, was down 2 percent from last year. The percentage changes from 1986 accumulated production by individual components were: Beef, down 3; Veal, down 18; Pork, up 1; Lamb and Mutton, down 7. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

CATTLE ON FEED IN 7 STATES

UP 7 PERCENT FROM LAST YEAR

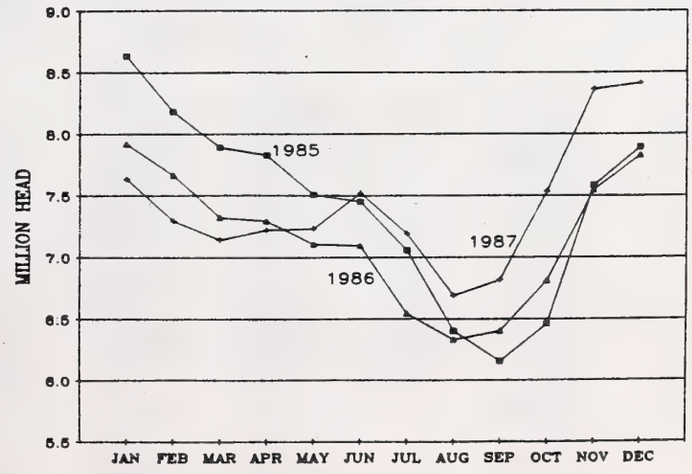
Cattle and calves on feed December 1, 1987, for slaughter market in the 7 States preparing monthly estimates totaled 8.41 million head, up 7 percent from both a year ago and December 1, 1985.

Marketings of fed cattle during November totaled 1.46 million, 1 percent above last year and 6 percent above November two years ago.

Placements of cattle and calves on feed in the 7 States during November totaled 1.61 million, down 11 percent from last year and down 9 percent from November 1985. Net Placements of 1.51 million for November are 13 percent below last year and 11 percent below 1985.

Other disappearance totaled 103 thousand head, compared with 87 thousand during November 1986 and 76 thousand during November 1985.

CATTLE ON FEED
7 STATES



POTATO STOCKS

Montana potato producers have 2,200,000 cwt of potatoes in storage as of December 1, compared with 2,150,000 on hand at this time last year. The December 1 stocks represent 93% of the 2,370,000 cwt. produced this year, while the December 1, 1986, stocks accounted for 96% of that year's production. Most of Montana's potatoes in storage will be sold for seed in many of the major potato production areas of the U.S.

December 1, 1987, potato stocks for the **U.S.** are estimated at 224 million cwt, up 7 percent from last year, but 5 percent below 1985. Stocks account for 67 percent of fall production this year compared with 68 percent last year. Storage is made up of 78 percent **russet**, 18 percent **white**, and 4 percent **red** potatoes.

Fall potato production in the U.S. was estimated at 343 million cwt, a gain of 8 percent over last year but 3 percent short of 1985. Area for harvest is set at 1.09 million acres, up 5 percent from last year but 5 percent below 1985. The average yield is a record high 314 cwt per acre, up 7 cwt from last year and 6 cwt above 1985.

The **9 Western States** potato production was estimated at 227 million cwt, up 9 percent from last year and fractionally above the 1985 crop. Harvest acreage is set at 620 thousand acres, up 8 percent from last year but 2 percent below 1985. Average yield per acres swelled to 366 cwt, 4 cwt above last year and 9 cwt above two years ago. Production in **Washington** and **Colorado** hit record highs with 67.0 million cwt and 19.5 million cwt, respectively. **Idaho** growers produced 99.7 million cwt, up 11 percent from last year. **Oregon** production is set at 25.9 million cwt, up 12 percent. **Nevada, Utah,** and **Wyoming** each produced fewer potatoes than last year.

All Potato production for the nation in 1987 (Winter, Spring, Summer and Fall) totaled 386 million cwt, up 7 percent from last year but 5 percent short of the 1985 crop. Harvested area totaled 1.28 million acres, up 5 percent from 1986 but 6 percent below 1985. The average yield climbed to 301 cwt per acre, up 5 cwt from last year and 2 cwt above 1985.

NOVEMBER MILK PRODUCTION

Milk production in the 21 selected States totaled 9.65 billion pounds. This is 3 percent above production for November 1986 in these same States.

During the July-September period the 21 selected States produced 85.4 percent of the U.S. production. If the producers in the 29 States not surveyed for December 1, followed the trend shown by the reporting States, the U.S. production would be about 11.3 billion pounds for November.

Production per cow in the 21 selected States averaged 1098 pounds during November, 42 pounds above November 1986. Milk cows in the 21 States averaged 8.78 million head, 1 percent less than November 1986 but 1000 head above October 1987.

TURNAROUND IN FARM PRODUCTION EXPENSES

Farmers will have sliced **$60 billion** off their debt in the 1985-88 period. Phenomenal. Granted, some of that has been written off. But note the historical change: Farm debt previously had climbed steadily year after year **since World War II** into the 1980's.

Farmers also spent less on farm production expenses in each of the last 3 years: 1985, 1986, and in 1987. When was the last time that farm production expenditures had decreased? **Not since 1953!**

This year cash farm income and net farm income are both setting **new records.** Where is the boom...the unbridled spending? What we have here is a **major change** in what farmers are doing with their dollars. Let's take a closer look at what happened between 1977 and 1984, and then what happened in the three-year period between 1984 and 1987 (figures are rounded; 1987 estimated):

What we have is a **monumental performance** of belt tightening, corner cutting, bailing wire repairs, living off inventory, paying down debts, and curbing new borrowing. Agriculture, as they would say, is not a **"lean machine".**

Meantime, rural towns and businesses have also suffered the shock. There was no "joy in Mudville" while this cost-cutting was going on; nor is there joy there yet, as farmers in 1987 have continued to cut expenses deeper.

Given today's outlook for increased **farm exports,** the expected decline in **carryover** stocks, and the leaner, stronger base in agriculture, the birds in the old farmyard tree should begin to sing a happier tune--and they might even drop off at the town square to sing a song or two.

Meantime, farmers' biggest market--U.S. **domestic demand**--has been increasing and setting records each year. If the U.S. economy continues to expand, and farm exports grow, there are better days ahead for farmers and rural towns.
USDA Executive Notes, December 18, 1987.

HAVE A

HAPPY NEW YEAR!

EXPORT PROSPECTS IMPROVE

Going into the New Year, those in agriculture have good reason to be optimistic, even though most are very cautious. Let's look at some of the good things that we see happening.

First of all, USDA recently hiked the farm export prospects by another 4 million metric tons and $1 billion. That pegs total export value at $32 billion, up 14% from the 1986-87 total. Montana wheat farmers should benefit because wheat and flour are the big gainers. In fact, U.S. producers could capture about 40% of the world wheat market in '87-'88. This strong demand has resulted in a decline in free stocks and improved prices.

Meanwhile, farmers have been busy cutting production costs. Since 1984, they have cut total production expenses by 18%. Biggest reductions were made in interest, fuel and fertilizer where costs were trimmed by about one-third. So it appears both prices and production costs are now moving in the right direction!

DON'T SCOFF AT THOSE RURAL SCHOOLS

"Prairie Center High" just might be a lot better than most people think, says Stuart A. Rosenfeld, Director, Southern Technology Council. Rural schools have **three things** going for them, he says: No. 1, rural schools are small enough in size that students have **quality** relationships, get motivated, and become involved in common goals. Students have greater opportunities to **take part** in activities, share positions of leadership, feel more important, and get more individual attention.

Big schools often turn impersonal and bureaucratic. Once you get beyond a few hundred students, the advantages of school size **disappear quickly**, says Rosenfeld. In his view, "The size at which schools can operate more effectively is closer to the average size of the **rural** school, not the urban school."

SEPTEMBER-NOVEMBER EGG PRODUCTION UNCHANGED FROM 1986

Montana poultrymen produced 48 million eggs during the September-November quarter equaling production for the same quarter last year, but down 4 million eggs (8 percent) from the previous quarter. The average number of layers on hand was 768,000, down 12,000 birds from the same quarter in 1986. The rate of lay averaged 62.5 eggs per 100 layers compared with 61.5 a year earlier.

The Nation's laying flocks produced 17.4 billion eggs during the September-November quarter, up 2 percent from the corresponding quarter a year ago. Layers for the quarter averaged 282 million, up 2 percent from the 278 million a year earlier.

All layers on December 1, 1987 totaled 285 million, up 2 percent from a year ago. Layers on December 1 consisted of 248 million for table eggs and 36.3 million layers for hatching eggs. Rate of lay on December 1 for all layers, averaged 68.3 eggs per 100 layers compared with 68.6 a year earlier.

Merry Christmas !

This year held mostly good news for those involved in Montana agriculture. We're thankful for the bountiful harvest of high quality grain, good hay and pasture crops and higher livestock prices. Lower production costs along with higher returns have helped relieve the credit crunch for many -- yet others are still under severe economic pressure with no way out.

This has been a year of change for our office staff. Bud Lies, Randy Van Winkle and Jerry Thorson transferred to other Statistical Offices while Carol Smith, Michelle Sutliff, and Linda Pratt moved on to new positions. We do appreciate their contributions to our service.

We welcome Curt Lund, Steve Susemihl, Perry Game, Vicki McCall, Jane Jimeno, Kayla McOmber, and Wendy Bruski to our staff.

We want to especially thank all of you who have participated in our surveys this year. Response was the best ever! We're dedicated to providing you with the best information available to help you make those difficult decisions.

We look forward to serving you during 1988. Merry Christmas and Happy New Year!

OCTOBER

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 97,000 gallons of ice cream during October -- a 32 percent decline from October 1986. Butter output totaled 136,000 pounds, down 29 percent from one year ago. Creamed cottage cheese production at 277,000 pounds was down 13 percent.

U.S. butter production in October was 90.2 million pounds, 6 percent above October last year and 15 percent above September 1987. Creamed cottage cheese production was 55.2 million pounds, 9 percent below October last year and 1 percent below last month.

October ice cream production, at 65.4 million gallons was down 7 percent from October 1986. Ice milk production was 26.9 million gallons, up 10 percent from last October. There were 2.96 million gallons of sherbet produced, down 6 percent from October 1986.

FOCUS ON PRICES

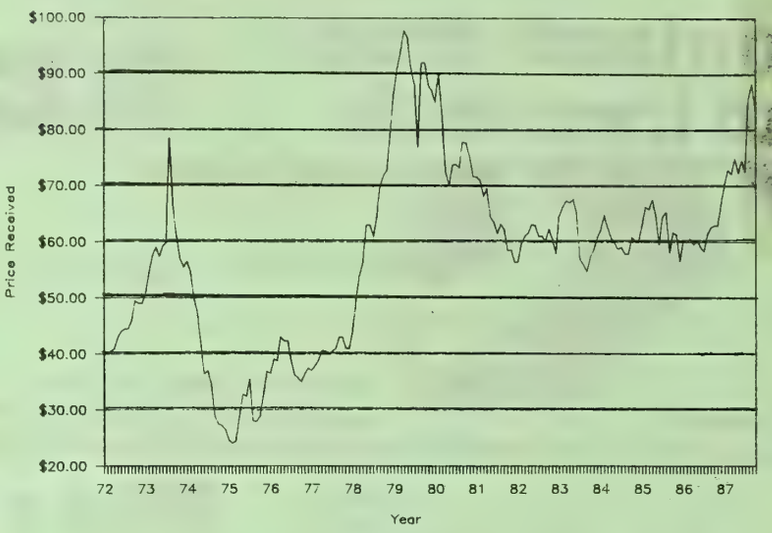
November crop prices for Montana are stronger than October and a year ago at this time. **Winter wheat** at $2.55, is up 5 cents from October. **Durum** is up 4 cents from October to $3.40. **Spring wheat** jumped 9 cents to $2.75, while **barley** edged upward 2 cents from October to close at $1.64. November prices for **hogs** fell sharply, $8.00 from October, to $35.00. In November of last year, hogs were going for $44.60. The Montana prices received index fell to 150, down 3 points from October, due mainly to decline in markets for livestock products. Nationally, producers fared better market-wise, compared with October, as the ratio of prices received index to prices paid index rose 2 points.

Montana livestock producers have enjoyed near record high prices this fall. Food and feed grains producers in Montana received low prices for their commodities compared with past records, but prices received the last few months have strengthened from a year earlier.

As the second half of 1987 progressed, the price received for steers and heifers rose, peaking in October at $74.00 per cwt., $6.40 short of the record set in April 1979. Since that all time high, producers have received a low of $51.70 in October of 1983.

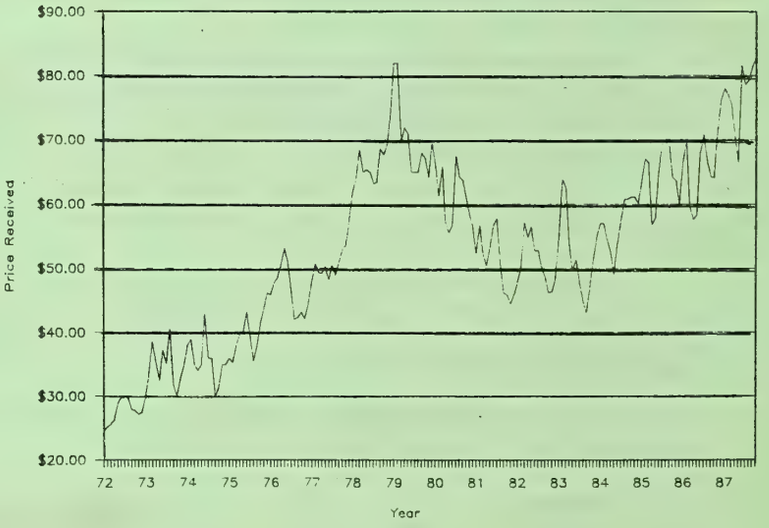
Producers in September were paid $88.30 for **calves**, which represents the peak for 1987 prices so far, but short of the 1979 record of $97.80. Operators received a low of $54.70 in September 1983.

Prices Received For Calves



The October price for **lambs** set a new record at $82.60. The second highest record price, $82.00, came in January and February of 1979 and dropped to a low of $43.00 in September 1983. Sheep producers in February 1987 experienced the second highest price ever, $29.90, to be topped only by $33.70 in December of 1985.

Prices Received For Lambs



Hog prices for 1987 peaked at $53.90 in July, while the 1986 peak came in August at $53.20. After bottoming out at $31.50 in September 1985, prices received for hogs in the summers of 1986 and 1987 approached the $57.40 record set in September 1982.

Producers enjoyed high prices for **alfalfa hay** in the mid 1980's with a record price of $90.00 set in June 1984, February, March, and April 1986. The price received for alfalfa hay in 1987 has basically bottomed out to lows which compare with the lows of the mid-1970's and the early 1980's.

Starting in 1974, small grain producers witnessed **record high prices** with the advent of Soviet grain purchases, fuel shortages, and limited grain supplies. As the 1970's wore on, market prices of **small grains** became more volatile.

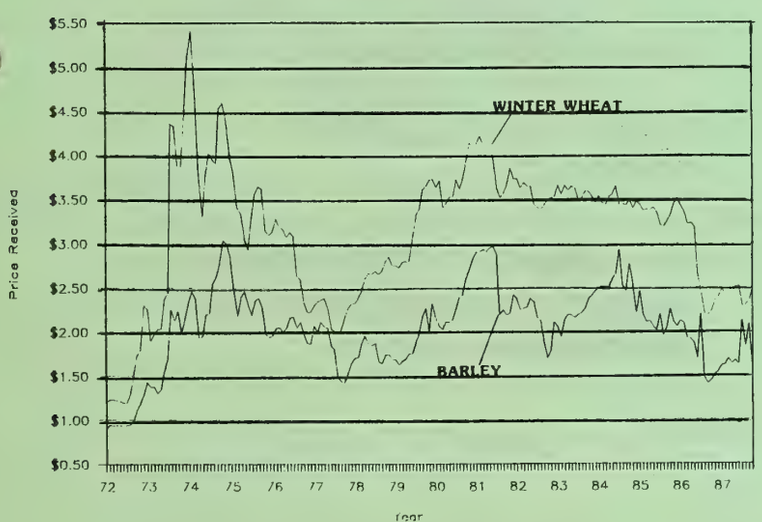
Prices Continued . . .

With large price fluctuations following the record high of $5.40 in February 1974, the price of **winter wheat** bottomed out at $1.99 in August 1977. The price of winter wheat strengthened in the late 1970's and stayed strong until June 1986. September 1986 saw the lowest winter wheat price, $2.19, since August 1977. Prices for winter wheat rose moderately at the close of 1986 and through the first half of 1987. They faltered in late summer and are now starting to rise again.

Spring wheat prices had a record high of $5.33 in February 1974 and a low of $2.19 in August 1977. Prices then rose, staying strong through May 1986, but fell a sharp $1.40 to $2.43 by September of 1986. Prices for spring wheat moved up moderately over the next 8 months, but then fell to $2.31 in July 1987. Spring wheat prices have been on the rise since then.

Montana **barley** producers have been buffeted by a regular, wide range of prices. From a record high of $3.04 in November 1974, the price fell to $1.43 in October 1977. Barley prices then rose to $2.97 in June 1981, but slipped to $1.70 in October 1982. With resiliency, they rose to $2.93 in July 1984, yet slipped in September 1986 to a new low of $1.41.

Prices Received For Small Grains



GORBACHEV'S VISIT PERKS INTEREST IN SOVIET AGRICULTURE

- The Soviet Union has 50,000 large, government operated farms. We have 2 million independent farm businesses or 40 farms to every one Soviet farm.
- About 20-25 percent of the Soviet farm output never reaches consumer because of poor transportation and storage facilities.
- Soviets ration meat - about 2 lbs. per person per month. Their average citizen spends 1/4 of income on food compared to less than 15 percent in the U.S.

FARM INCOME UP IN '86

A look at Montana's farm income situation shows why many have had trouble staying in business, but sharp improvement was seen in 1986. Montana's net farm income rose over $500 million from 1985 to 1986. The $235 million earned in 1986 was the highest since 1975 and follows three consecutive years of net losses. These figures show that each of Montana's 23,600 farms had net income of $9,941 in 1986.

The sharp improvement in 1986 was mostly due to an increase in government payments and a build up in farm product inventories. Cash receipts from marketings were actually down, and at the lowest level since 1977.

Improvement in net income was also made possible by a rollback in production expenses of about 11 percent during the past two years. Costs of feed, fuel, fertilizer and interest were sharply lower while other expenses held steady.

Government payments hit a record high $366 million in 1986, up 65% from 1985. If government payments were subtracted from net income, farmers would have lost about $5,600 per farm instead of netting $9,941.

Total cash receipts from farm marketings totaled $1,144.8 million in 1986, the lowest sales figure in ten years. Lower crop prices nearly offset a big increase in grain marketings while livestock marketings fell following two years of herd liquidations.

HIGHLIGHTS:

October Red Meat Production
Cattle on Feed
Farm Labor
CRP Halfway to Goal

OCTOBER RED MEAT PRODUCTION DOWN 18% FROM 1986

Montana slaughter plants produced 1.7 million pounds of red meat in October 1987. This production is up 12 percent from the previous month but down 18 percent from the October 1986 production.

The number of cattle slaughtered, at 2,100 head, was down about 600 head from last year, and total liveweight was down about 24 percent. Hog slaughter, at 2,400 head, was down about 200 head from last year, and total liveweight was 7 percent below last year.

Commercial red meat production for the U.S. in October 1987 totaled 3.53 billion pounds, up 1 percent from October 1986. January-October red meat production, at 31.9 billion pounds, was down 3 percent from last year. The percentage changes from 1986 accumulated production by individual components were: beef, down 4; veal, down 18; pork, nearly the same; lamb and mutton, down 8. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

CATTLE ON FEED IN 7 STATES UP 11 PERCENT FROM LAST YEAR

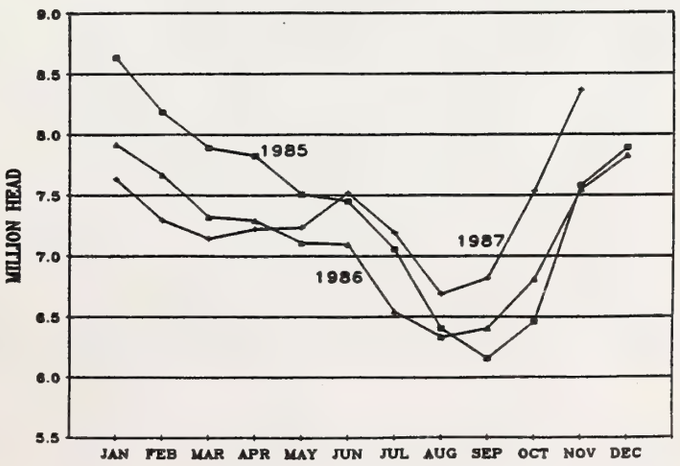
Cattle and calves on feed November 1, 1987 for slaughter market in the 7 States preparing monthly estimates totaled 8.36 million head, up 11 percent from a year ago and 10 percent above November 1, 1985. This is the largest November number on feed since 1978.

MARKETINGS of fed cattle during October totaled 1.69 million, 6 percent above last year and 7 percent above October two years ago. This is the largest number of October marketings since 1978.

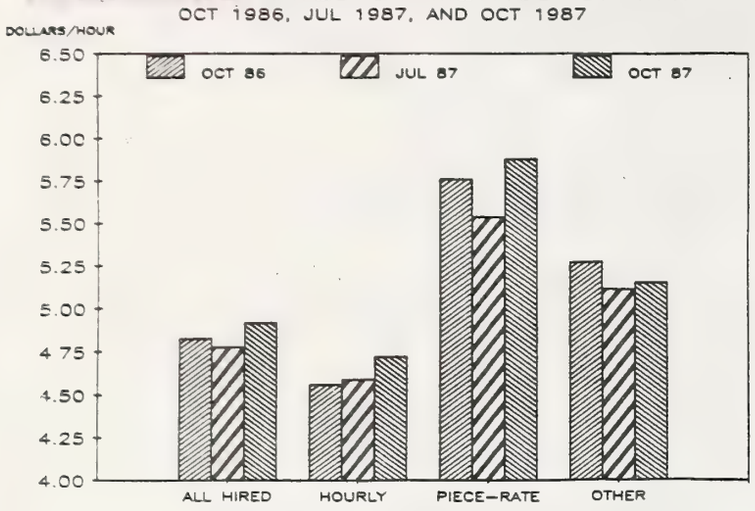
PLACEMENTS of cattle and calves on feed in the 7 States during October totaled 2.60 million, up 8 percent from last year but down 6 percent from October 1985. NET PLACEMENTS of 2.52 million for October are 8 percent above last year but 6 percent below 1985.

OTHER DISAPPEARANCE totaled 85 thousand head, and compares with 81 thousand during October 1986 and is equal to the other disappearance during October 1985.

CATTLE ON FEED
7 STATES



U.S. WAGE RATES BY METHOD OF PAY
OCT 1986, JUL 1987, AND OCT 1987



NUMBER OF WORKERS UP - WAGE RATES INCREASE

A total of 3.07 million people worked on the Nation's farms and ranches during the week of October 11-17, 1987. This number compares with 3.04 million workers during the comparable survey week in 1986. The workforce was made up of 1.32 million self-employed farm operators, 524,000 unpaid workers and 997,000 workers hired directly by farm operators. Rounding out the total were 227,000 agricultural service employees. Self-employed and hired worker numbers were both up 3 percent and 2 percent from last year, respectively. Unpaid workers and service workers were down.

The all hired farm worker wage rate in October was $4.92 per hour, up 9 cents from a year earlier. Workers paid on an hourly basis earned $4.72 per hour compared with $4.56 last October. Wage rates for field and livestock workers were $4.80 and $4.27, respectively. During October 1986, field workers made $4.61 while livestock workers earned $4.37.

During the October 1987 survey week, self-employeed persons worked an average of 46.6 hours, 2.1 hours less than in the comparable week in 1986. Unpaid workers, who worked 15 hours or more during the week, put in 37.3 hours compared with 37.0 a year earlier. Hired workers spent an average of 40.5 hours doing agricultural work, up 0.6 hour from October of last year.

Perquisites and other benefits such as housing and food were provided to 44 percent of the hired workers. Housing was furnished to 13 percent of the workers, unchanged from the October survey period a year ago.

FARM ACTIVITIES DURING SURVEY WEEK

Corn and soybean harvests were intense during the survey week of October 11-17, 1987, even though rain slowed these activities in a few Corn Belt States.

Seventy-six percent of the Nation's corn corp was harvested compared with a 5-year average of 38 percent. Soybeans were 77 percent harvested compared with a 43 percent average. Winter wheat seeding advanced 8 points during the week to 87 percent completion, 13 points ahead of normal. Cotton was 46 percent harvested, 14 points above average. Slow maturity restricted cotton harvest in New Mexico, Oklahoma, and Texas.

Fall vegetable harvest and winter planting continued on schedule in Florida and fresh fruit harvest was on the increase. California grape and valencia orange harvests were virtually complete while desert grapefruit and fairchild tangerine harvests gained momentum. A hot, dry fall delayed Washington's apple harvest and concentrated picking of the crop into a shorter than normal period which peaked during the survey week.

CRP HALFWAY TO GOAL

The most recent signup period for the Conservation Reserve Program (CRP), in July 1987, brought total signup to over 200,000 contracts covering almost 23 million acres. Contracts have been signed to retire about 2 million acres in fiscal 1986, 13.4 million in fiscal 1987, and 2.3 million in fiscal 1988.

During the July signup, 0.4 million acres for 1987 and 4.9 million for 1988 were accepted by USDA, but as yet they have not been contracted. Typically, about 7 percent of the acres accepted are not contracted.

Rental rates increased steadily from just over $42 per acre in the first signup period to over $51 by the fourth, then dropped to $48 in the most recent period. Much of the increase can be explained by changes in the geographical location of the acreage bid, and by farmers' increasing knowledge of their area's maximum acceptable rental rate, or bid cap.

For instance, following the first three signup periods, enrollment in the Corn Belt - where bid caps are highest - was only about 9 percent of the U.S. total. After the fourth signup, though, the Corn Belt accounted for over 15 percent. Enrollment in the Mountain region, where bid caps are relatively low, was over 27 percent of total U.S. enrollment following the third signup, but dropped to 21 percent after the fourth signup.

480 Million Tons of Soil Saved from Erosion

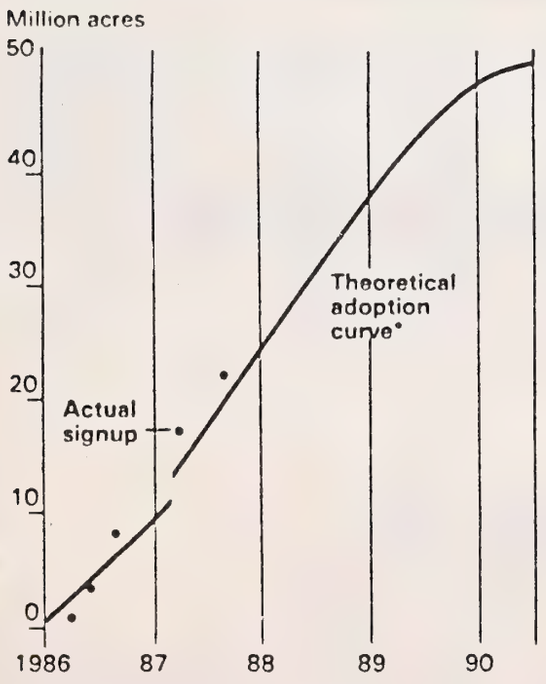
Annual erosion savings continued to decline, from 27 tons per acre in the second signup period to 19 tons in the fourth signup. The average for all acres enrolled to date is just over 21 tons per acre. Thus, the 23 million acres enrolled provide erosion savings of roughly 480 million tons annually.

The erosion savings are obtained by establishing permanent cover or implementing other specific soil conservation practices on the enrolled acreage. About 85 percent of the acres enrolled are to be covered with grass or legumes - about one-third of these native species. A little more than 5 percent will be placed in trees. About 4 percent will be used for wildlife habitat, while the remainder is already in grass or legumes or other conservation practices.

Participation in the CRP continues to be highest in the Northern Plains, Southern Plains, Mountain, and Pacific regions. The Mountain region enrolled over 51 percent of its available acreage (eligible acreage is constrained by the 25-percent per county limit unless an exception has been provided.)

The next highest level of participation occurs in the Pacific region, with over 43 percent of the available acreage enrolled, followed by the Northern and Southern Plains with just over 40 percent. Participants in the Northern Plains enrolled the greatest absolute amount, about 5.2 million acres, followed by the Mountain, Southern Plains, and Corn Belt regions with 4.8, 3.7, and 3.3 million acres, respectively.

CRP Signup Strong But Slowing



*Upward shift in theoretical adoption curve is due to expanded eligibility criteria adopted in February 1987

The percentage of cropland enrolled and the concentration of participation have a greater impact on the local, state, and regional economies than total acreage enrolled or the level of participation. The higher the percentage of cropland enrolled, and the greater the regional concentration, the greater the impact.

Only 576 of the 3,026 counties in the United States enrolled more than 6 percent of their total cropland in the CRP. Of these counties, 49 enrolled more than 25 percent of their total, based on total cropland estmates from the 1982 Census of Agriculture.

However, total cropland includes land used to produce hay, fallowed and idled land, and land where crop production failed. Because economic activity is based upon the volume of crops produced and marketed, the percentage of harvested cropland enrolled may be a better indicator of the magnitude of the impact.

Some 779 counties have enrolled more than 6 percent of harvested cropland, while 170 of these counties have enrolled more than 25 percent. Texas has 37 counties, or about 20 percent of its counties, with more than 25 percent of harvested cropland enrolled.

Other states with a large number of counties enrolling more than 25 percent of harvested cropland inlcude Colorado (15), Mississippi (13), Montana (11), and Kansas (10). Although New Mexico has only 7 counties with more than 25 percent of harvested cropland enrolled, these counties represent half the agricultural cropland in the state. Thus, the states just listed are likely to feel the greatest impact on their economies.

Two factors are primarily responsible for the concentration with states and regions. First, participation is greatest in areas with the greatest amount of eligible (highly erodible) cropland. The Corn Belt and Northern Plains regions have the most eligible cropland, over 40 percent of the U.S. total. However, the Mountain and Southern Plains regions, which have the third and fourth most eligible cropland, have the highest proportion of eligible to harvested cropland, with 36 and 31 percent, respectively.

Payment-to-Cash Rent Ratio Strongly Influences Participation

The second factor strongly influencing participation is the annual rental payment relative to the average cash rent in the area. The larger the annual rental rate compared with the average cash rent, the greater the participation.

To encourage participation in the program, the annual CRP rental payment must be at least as high as the cash rent a producer currently receives. This annual payment must cover the cash rent lost by enrolling, the cost of establishing and maintaining a permanent cover, and the risk associated with accepting a rental payment that will be less than future earning potential of the land. The average establishment cost is about $40 per acre, with an annual maintenance cost of about $12 per acre.

In general, participation is higher than the national average when the ratio of the annual CRP rental rate to average cash rent is 1.5 or greater. Exceptions to this occur in the Northeast and Pacific regions, as well as Minnesota and North Dakota.

Clearly, the continued increase in cash rents and land values in the Northeast region provides an explanation for that area's failure to follow the rule of thumb. Minnesota's Reinvest in Minnesota (RIM) conservation program, with state inducements augmenting Federal payments, may explain its heavy participation with lower bid-to-rent ratios.

The next (sixth) signup is scheduled in February 1988.

PASTURE AND RANGE CONDITION

Montana's pasture and range condition on November 1 was rated mostly fair. Drier weather has reduced conditions statewide. Currently, at 78 percent of normal, the pasture and range condition is less than last month's 82 percent, and last year's 88 percent rating. Northwestern counties generally have the poorest conditions, while conditions in the south and east remain good to excellent.

NOVEMBER 1, 1987

Montana Pasture & Range Condition by District as a Percentage of Normal

Southwest	65	98	82
South Central	50	84	75
Southeast	42	74	84
STATE	54	88	78

PORK SHORTFALL BENEFITED BEEF

Beef producers benefited from smaller pork production. In the second quarter, beef output was 8 percent below a year earlier because of a 20-percent reduction in cow slaughter and a 2-percent drop in fed cattle marketings.

Beef production would have been even lower, but to make up for reduced pork supplies, packers bid up prices for fed cattle to get feeders to market them ahead of schedule. Fed cattle in the High Plains area were marketed 20 to 40 pounds lighter than a year earlier.

Prices for Choice fed steers at Omaha rose from near $60 per cwt in the winter quarter to over $70 in mid-spring. Fed cattle marketings began to rise in July because of large feeder cattle placements during the first half of 1987. Although prices declined to the middle $60's, cattle feeders continued a brisk marketing pace on the increasing supply of fed cattle.

The market will have to contend with record total meat production this fall and through at least 1988, if not well into 1989. This increase occurs as poultry production continues to expand and pork production continues the expansion begun this summer. Broiler and turkey prices are already well below a year ago, and hog prices declined sharply in late summer.

Beef production is expected to decline seasonally this fall to 4 percent below a year earlier. Fed beef supplies will decline but remain above a year earlier through mid-1988, while nonfed slaughter is expected to decline further. Further reductions in beef production will be very positive for the cattle sector. However, expanding supplies and lower prices of competing meats will intensify competition within the livestock sector.

1986 MAY HAVE BEEN THE BOTTOM

The low point in the farm economy may have been fiscal 1986. Farm expenditures by the Government, as measured by net CCC outlays, reached an alltime high of $25.8 billion.

This happened in a year when farm foreclosures were high, the amount of debt at risk was extremely large, land values were dropping, and the export news was mostly bad. Farmers were harvesting near-record crops to sell at lower prices to a shrinking market. Crop receipts in 1986 were down $11 billion from 1985.

This all sounds discouraging for farmers, but farm income was record high last year, partly because income protection was in place. In 1986, net cash income was $52 billion, of which direct Government payments constituted $11.8 billion. Farmers were also helped by lower cash expenses.

The income picture is even better in 1987. Net cash income is forecast to be $54-$58 billion, helped by additional support, lower expenses, strong livestock receipts, and expanding exports. However, $14-$16 billion of this total is direct Government payments.

One feature of the farm act was to freeze target prices at 1985 levels in 1986 and 1987 and allow loan rates to drop. This maintained income protection while stimulating export and domestic sales. Target prices will fall slightly in 1988. Despite a flurry of new farm legislation introduced in 1987 to amend the 1985 act, it seems to be meeting the first of its original goals - income and exports are up.

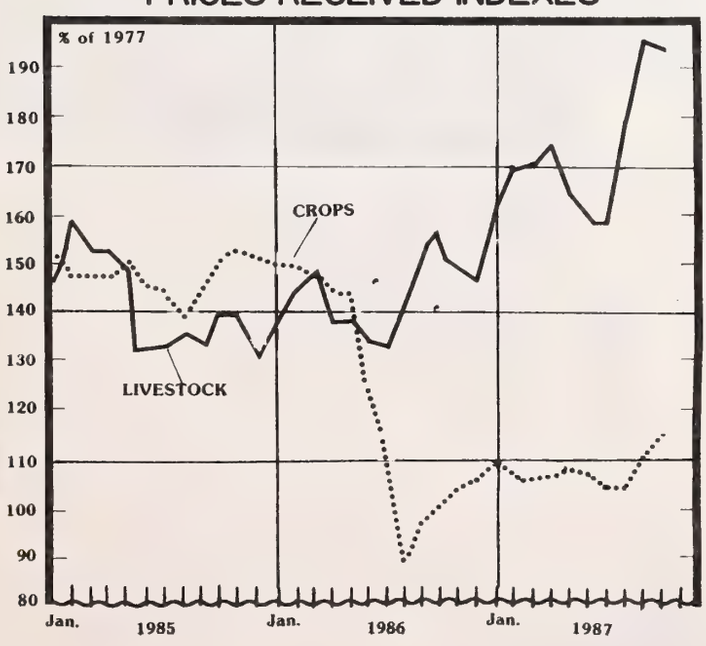
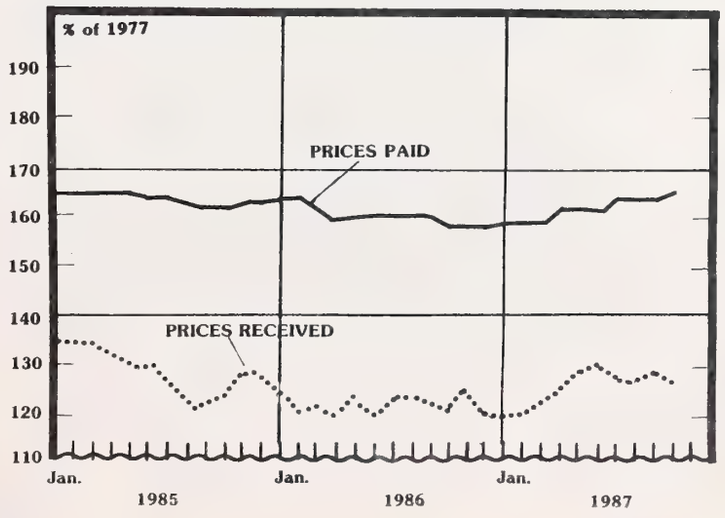
MONTANA CROP & LIVESTOCK PRICES RECEIVED INDEXES



UNITED STATES INDEX NUMBERS OF PRICES PAID & PRICES RECEIVED



SEPTEMBER MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 142,000 gallons of ice cream during September - a 4 percent increase from September 1986. Butter output totaled 116,000 pounds which was down 31 percent from one year ago. Creamed cottage cheese production at 315,000 pounds was up 4 percent.

The U.S. butter production in September was 78.1 million pounds, 3 percent below September last year, but 16 percent above August 1987. Creamed cottage cheese production was 55.9 million pounds, 3 percent below last year and last month.

September ice cream production, at 76.8 million gallons was up 3 percent from September 1986. Ice milk production was 28 million gallons, up 7 percent from last September. There was 3.8 million gallons of sherbet produced, up 4 percent from September 1986.

AG PRICES

Montana farm prices remained mostly strong in October, with lamb prices reaching a new record high. Farm prices in the state remain well above last year for most commodities. Compared with the previous month, prices for barley, beef cattle, sheep, calves, and eggs had modest declines while hog prices were reduced sharply. All other commodity prices increased or stayed the same.

The October All Farm Products Index of Prices Received, at 156 points (1977=100) is unchanged from last month's level, but is 26 points higher than last year.

The Livestock and Products Index, at 194, is 3 points lower than last month, but 37 points higher than last year.

The All Crops Index stood at 115 for the month -- 4 points higher than last month and 15 points higher than last year.

MONTANA BEEF SITUATION POSITIVE

Meat is still the main course when it comes to meals served in this country. That's why consumers watch meat prices closely when filling their shopping carts.

Since last spring, meat supplies have been smaller than expected and prices higher. Pork production fell short of expectations and pork prices went up. That also helped Montana's beef producers. Beef packers bid up prices to move more beef into the marketplace.

Cattle feeders have plenty of low-priced feed available and they are looking for good calves to feed. They are paying the highest prices since 1979 here in Montana.

Beef supplies are expected to remain tight as ranchers rebuild herds. But, beef at the meat counter will continue to receive stiff price competition from pork and poultry.

Broiler and turkey supplies are up, so prices will probably drop lower. In fact, Thanksgiving turkeys should be a bargain this year. At the same time, lean beef is being recognized as important to a balanced, healthful diet. Of course, we knew that all along!

LIVESTOCK SLAUGHTER - SEPTEMBER 1987

Montana slaughter plants produced about 1.5 million pounds of red meat in September 1987. This production was down 9 percent from the previous month and was down 34 percent from the September 1986 production.

The number of cattle slaughtered, at 1,800 head, was down about 1,300 head from last year. Total liveweight was down 39 percent from one year ago. Hog slaughter at 2,400 head, was down 4 percent from last year while total liveweight was down 7 percent.

Nationally, commercial red meat production in September totaled 3.33 billion pounds, up 2 percent from September 1986. January-September red meat production, at 28.3 billion pounds, was down 3 percent from last year. The percentage changes from 1986 accumulated production by individual components were: Beef, down 4; Veal, down 18; Pork, down 1; Lamb and Mutton, down 8. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

FOR YOUR INFORMATION

Several times each year we receive a note from a farm or ranch operator telling us they requested the survey results but they never got it. Has this ever happened to you? If so, perhaps this explanation will help.

Lets go back to the beginning. Our office conducts mail and telephone surveys to collect basic data used in estimating crop and livestock production, inventory, and price. When we contact you we usually ask if you would like to receive the survey results. If yes, your name is placed on the list to receive a copy of this publication, the "Montana Crop & Livestock Reporter", containing a story and sometimes a table showing the survey results that includes your data.

The "Montana Crop & Livestock Reporter" is issued twice each month. Some of you have asked to receive every issue, while others only receive an issue when it contains data of interest or survey results that you have requested.

Although survey results are always carried in the "Reporter", we have periodically issued special reports when the volume of information is high. Examples are: quarterly surveys on crop production, grain stocks and farm finance.

We try to provide you with the best possible service within our budget allocation. Please call us if you have questions or comments.

Lyle H. Pratt, State Statistician

WORLD WHEAT CROP DOWN

World wheat production in 1987/88 is forecast to **fall 4 percent from** 1986/87 to 506 million tons, but the crop is still the **third largest on record.** Total foreign production is down 5 percent to 448 million tons. The big crop, combined with large carry-in stocks, will ensure continued strong competition and low export prices.

CATTLE ON FEED UP 10 PERCENT

Cattle and calves on feed October 1, 1987 for slaughter in the 13 Quarterly States totaled 8.99 million head, up 10 percent from October 1 last year and 13 percent above 1985.

The cattle on feed inventory included 5.90 million steers and steer calves, 14 percent above last year and 20 percent above 1985. This group represented 66 percent of the total October number on feed compared with 63 percent in 1986. Heifers and heifer calves accounted for 3.06 million, up 2 percent from both a year ago and 1985.

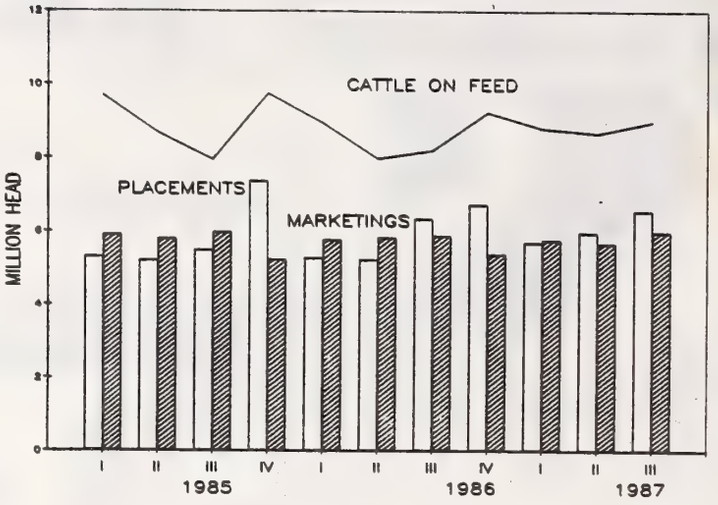
PLACEMENTS of cattle and calves on feed during the July-September quarter totaled 6.56 million, up 3 percent from last year and 20 percent above the comparable period in 1985. This is the largest third quarter placements since 1978. OTHER DISAPPEARANCE of 245 thousand head leaves NET PLACEMENT at 6.31 million.

MARKETINGS of fed cattle for slaughter during July-September totaled 5.99 million, 2 percent more than a year ago and slightly above 1985.

EXPECTED MARKETINGS FOR OCTOBER-DECEMBER 3%

Cattle feeders expect to market 5.51 million head during the October-December quarter of 1987. This would be 3 percent more than the fourth quarter marketings in 1986 and 6 percent more than in 1985.

CATTLE ON FEED, PLACEMENTS, MARKETINGS
BY QUARTERS FOR 13 STATES

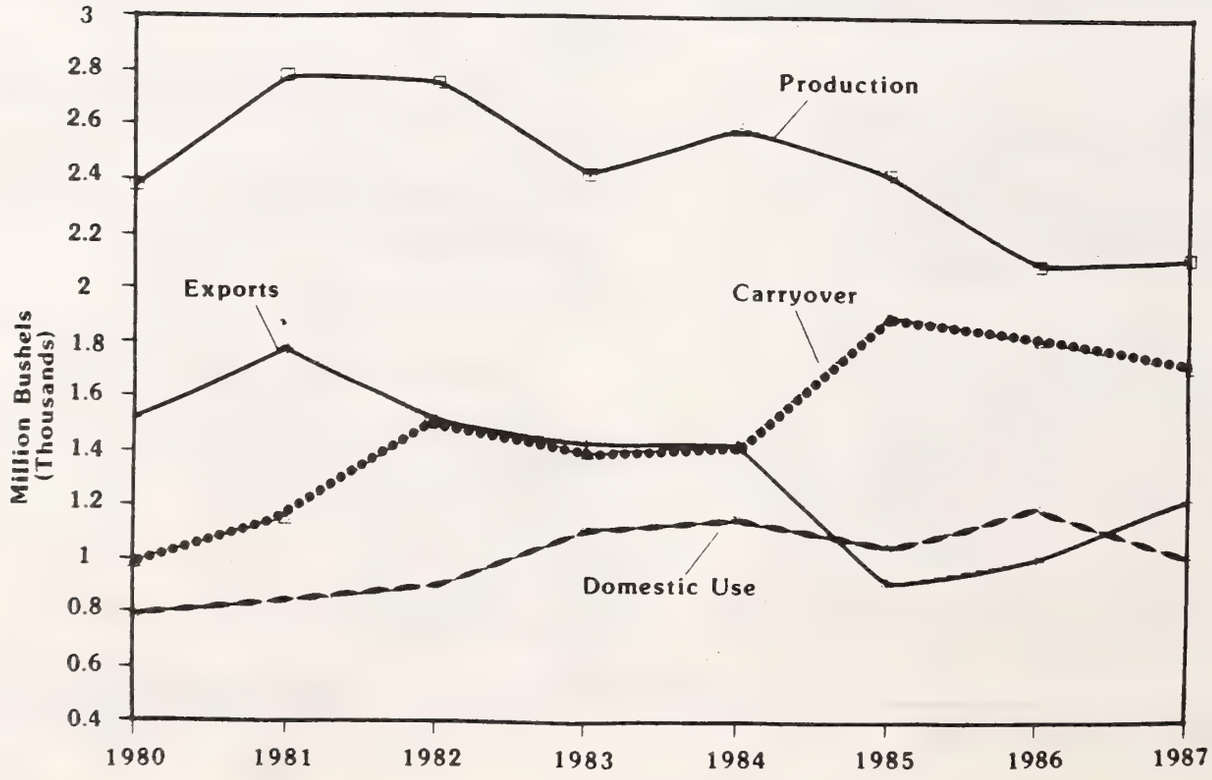


FEEDER DEMAND STRONG

Cattle herd liquidation over the last 5 years has largely ended in 1987, but expansion is not likely until at least 1988. However, a 4-percent reduction in beef production in 1987 has already resulted in fed cattle prices rising to an average of more than **$6 per cwt above a year ago.** These higher prices, plus a 30-percent drop in feed costs, have brought in a strong demand for the reduced supply of feeder cattle. Prices for stocker-feeder cattle in various weight groups at Kansas City show increases of $9 to $13 per cwt over 1985-86 averages.

U.S. WHEAT

Production, Use, and Carryover



MILK PRODUCTION

Montana's milk production during the third quarter of 1987 was 86 million pounds. This production reflects a 1.2 percent increase from the July-September period for 1986. Milk cow numbers declined 1,000 head from last year to 25,000.

Grain and other concentrates fed to milk cows on October 1 averaged 15.5 pounds per head, an increase of 2.0 pounds from last year. The cost per hundredweight of these feeds dropped 35 cents to $6.20/cwt.

Nationally, milk production was up slightly at 35.8 billion pounds, compared with 35.6 in the period of July-September 1986. The average number of cows in the U.S. during the July-September quarter was 10.4 million head, 2.7 percent below July-September last year.

MORE FORAGE FOR FEWER CATTLE

Forage conditions this year are good in almost all areas, particularly compared with the poor conditions in many places in 1982-86. Drought hit much of the Southern Great Plains in 1982-84 and the Southeast in the summer of 1986. Drought and poor forage conditions were also troublesome in parts of the West, most notably this past summer in the Pacific Northwest and California.

Pasture and range feed conditions on September 1 were rated 76, 3 points below a year ago but 3 above the 1976-85 average. While conditions are very favorable in most areas, the **drought in the far Western states continues.** Parts of the Southeast have also been dry, but recent rains should provide needed moisture to establish small grain pasture for fall and winter grazing.

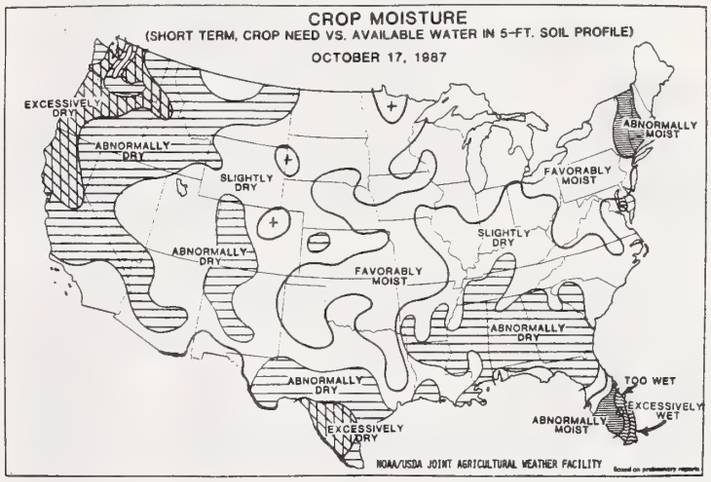
EXPORTS RISE

The forecast for U.S. agricultural exports in fiscal 1987 is for a value of $28 billion and a volume of 129 million tons. **Volume is up 18 percent** from a year earlier, but with lower prices, **value** is up less, **at 6 percent.** Still, the export trade balance is up about $2 billion. Exports are expected to expand again in 1988, gaining in both value and volume, as world agricultural trade rises and the United States maintains or widens its trade share.

MONTANA IS DRY

Montana's weather has been mostly dry since early September. By the end of October over two-thirds of the state had short topsoil moisture. Subsoil moisture was still mostly adequate. The dryness has not yet damaged winter wheat stands that were rated in late October as 1 percent poor, 33 percent fair, 58 percent good, and 8 percent excellent.

Dryness covers much of the western United States. In Montana, dry weather is good for livestock care, but leaves winter wheat vulnerable to wind and freeze damage.



BANK FAILURES INCREASE

Although net cash income is setting another record in the $54-$58 billion range this year, and the credit crunch appears to have passed its peak, bank failures are not abating. Commercial bank **failures** during the first half of this year **increased 50 percent** from a year earlier. Failures of banks in rural areas during January-June were the highest of any 6-month period in the 1980's. However, the proportion of rural bank failures to total failures is slightly below its 1985 peak.

PASTURE & RANGE

Montana's pasture and range condition on October 1 was reported to be good to excellent. At 82 percent of normal the pasture and range condition compares with last month's 85 percent and last year's 82 percent. Some variation in pasture and range conditions exist statewide with the Northwest, Central, and Southcentral districts rated poor to fair, while the rest of the state rated good to excellent.

OCTOBER 1, 1987

Montana Pasture & Range Condition

By District as a Percentage of Normal

DISTRICT	1985	1986	1987
Northwest	75	97	77
North Central	69	89	82
Northeast	30	74	85
Central	60	89	78
Southwest	61	91	87
South Central	43	78	78
Southeast	48	63	86
STATE	54	82	82

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 141,000 gallons of ice cream during August -- 28 percent less than in August 1986. Butter output for August totaled 92,000 pounds which was down 13 percent from one year ago. Creamed cottage cheese production at 312,000 pounds was down 8 percent.

Nationally, butter production was 67.6 million pounds, 3 percent below August last year and 11 percent below July 1987.

Creamed cottage cheese production was 57.5 million pounds, 6 percent below August last year and 3 percent below July 1987.

Ice cream production, at 85.3 million gallons was down 2 percent from August 1986. Ice milk production was 33.3 million gallons, up 3 percent from last August. There was 4.66 million gallons of sherbet produced, down 2 percent from August 1987.

AG PRICES

Agricultural prices received by Montana farmers and ranchers maintained a 3 month upward trend for most commodities in September. The All Farm Products Index (1977=100) for September at 152 is 10 points higher than the August index, and 25 points higher than last year. Higher livestock prices continue to support much of this general increase.

The Livestock and Products Index at 194, is 17 points above last month and 39 points above last year. Prices received for beef cattle, steers-heifers and calves are the highest since 1980.

The All Crops Index also strengthened to 106 -- 2 points higher than last month, and 9 points higher than last year's level. All crop prices increased from last month except those for barley and hay.

MONTANA RANKS THIRD IN WHEAT PRODUCTION

Montana's 1987 wheat crop was one of the best ever. Only the crops of 1976, 1981 and 1982 were better, but the 1987 crop was good enough to rank third nationally! This year's all wheat yield at 32.2 bushels was second to the record 33.6 bushels produced in 1982.

The October 1 estimate of 2.2 million acres of winter wheat harvested is up 200,000 from both last year and the previous estimate. Changes were based upon results from the September Agricultural Survey. Hard spring wheat harvested acres, at 2.3 million, were unchanged, but were 300,000 acres less than 1986. Durum wheat harvested acreage, at 190,000 was down 10,000 from last month, but up 30,000 from 1986.

WORLD WHEAT TRADE

Total world wheat trade (July-June) is forecast at 94 million tons, 5 percent above 1986/87, but still 13 million tons below the 1984/85 record. Following last season's record crop, Canada had over 12 million tons of wheat in storage at the beginning of the year. These stocks should permit 1987/88 Canadian exports to nearly match 1986/87 shipments of 21 million tons. But Australia's stocks are much smaller than last year, and exports will drop with the smaller crop.

U.S. exports continue to expand with the assistance of Government programs. New U.S. initiatives extended under the Export Enhancement Program between July and the end of August include 1 million tons to China, 500,000 tons each to the Philippines, Poland, Egypt, and Morocco, and 300,000 tons each to Algeria, Brazil, and Colombia. U.S. shipments (July-June) for 1987/88 are expected to gain 18 percent to 33.5 million tons (1.2 billion bushels).

MONTANA'S RECORD BARLEY CROP RANKS SECOND IN U.S.

Barley produced in Montana set a new record. The yield of 45 bushels per acre was surpassed only by 1982's 49 bushels per acre. This year's production was 11 percent above the previous record set last year and, again, pushes Montana to second - behind North Dakota - in barley production.

Barley production is down slightly from the previous estimate because harvested acreage was reduced by 100,000 acres, but this reduction was offset by an increase of 2.0 bushels per acre in yield.

WHEAT STOCKS UP 13 PERCENT

Montana wheat stocks in all storage positions on September 1, 1987, totaled 212 million bushels, up 13 percent from a year ago. The current stocks level is the second highest on record.

Barley stocks in all positions reached 92.6 million bushels. There were no comparable stocks estimate made for barley in September of 1986.

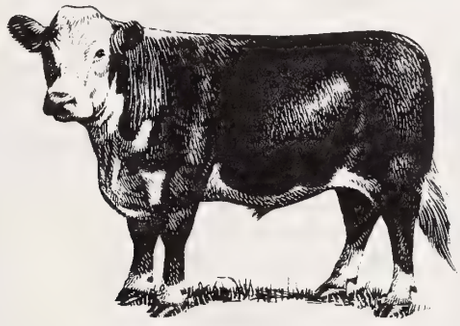
Quarterly Egg Production



RED MEAT DOWN 2 PERCENT

Montana slaughter plants produced about 1.6 million pounds of red meat in August 1987. This production was down 2 percent from the previous month and is down 17 percent from the August 1986 production.

The number of cattle slaughtered, at 1,900 head, was down about 700 head from last year. Total liveweight was down 27 percent from one year ago. Hog slaughter at 2,600 head, was up 4 percent from last year while total liveweight was up 3 percent.

Nationally, commercial red meat production in August 1987 totaled 3.13 billion pounds, down 1 percent from August 1986. January-August red meat production, at 25.0 billion pounds, was down 4 percent from last year. The percentage changes from 1986 accumulated production by individual components were: Beef, down 4; veal, down 19; pork, down 2; lamb and mutton, down 8. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

CATTLE ON FEED UP

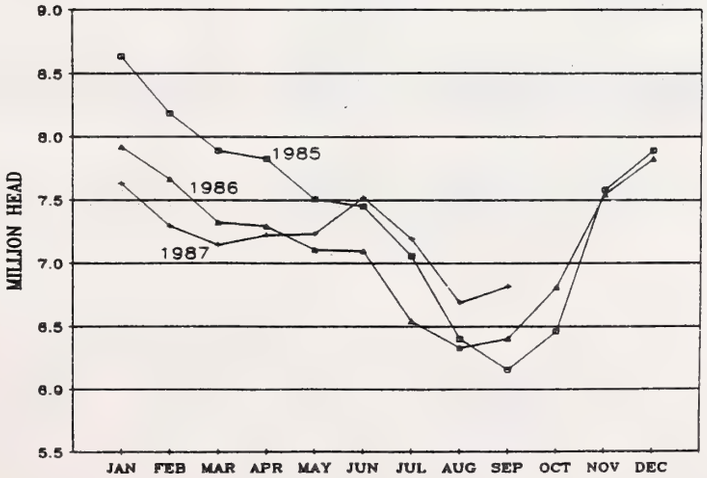
Cattle and calves on feed September 1, 1987 for slaughter market in the 7 states preparing monthly estimates totaled 6.82 million head, up 6 percent from a year ago and 11 percent above September 1, 1985.

MARKETINGS of fed cattle during August totaled 1.70 million, 2 percent above last year and fractionally above August two years ago making this the largest August total since 7 states estimates were begun in 1972.

PLACEMENTS of cattle and calves on feed in the 7 states during August totaled 1.90 million, up 5 percent from last year, 26 percent above August 1985, and the largest number of August placements since 1972. NET PLACEMENTS of 1.83 million for August are 6 percent above last year and 26 percent above August two years ago.

OTHER DISAPPEARANCE totaled 68 thousand head, compared with 70 thousand during August 1986 and 62 thousand during August 1985.

CATTLE ON FEED
7 STATES



WHEAT & BARLEY MOVEMENT

Montana **wheat** shipped to out-of-state destinations in December 1986 - May 1987 at 59.0 million bushels was more than double the same period last year. Wheat exports from the state reflected production increases as most areas recovered from the 1985 drought.

Movement into eastern destinations, at 1.6 million bushels, was down 19 percent while shipment of 56.3 million bushels of wheat to western destinations was up 129 percent from a year earlier. Other destinations, mostly south and southeast of Montana at 1.1 million bushels, were down 25 percent from last year.

Wheat shipments to western destinations accounted for 95 percent of all out-of-state shipments, which compares with 88 percent in the December 1985 - May 1986 period.

Rail movements amounted to 83 percent of total shipments in the 1986-87 period compared with 73 percent the previous year.

Montana **barley** shipped to out-of-state destinations December 1986 - May 1987 was a record 31.4 million bushels. Rail movement accounted for 93 percent of total shipments, and 84 percent of the rail shipments went to western destinations.

In spite of increased total barley movement, truck shipments were down 24 percent from the comparable six-month period of 1985-86.

1/ This report is based on data reported by commercial elevators and licensed truckers. The reported data were expanded to represent 100 percent coverage of elevator capacity. 2/ Includes durum. 3/ Other and unknown.

Grain Movement statistics are made possible through funds provided by the Montana Wheat & Barley Committee through the Montana Department of Agriculture.

AUGUST MILK PRODUCTION - 21 STATES

Milk production in the 21 selected states totaled 10.3 billion pounds. This was 1 percent more than production in these same states for August 1986.

During the April-June period the 21 selected states produced 85.2 percent of the U.S. production. If producers in the 29 states not surveyed for September, followed the trend shown by the reporting states, the U.S. milk production would total about 12.0 billion pounds for August.

Production per cow in the 21 selected states averaged 1,171 pounds during August, 38 pounds above August 1986. Milk cows in the 21 states averaged 8.77 million head, 2 percent less than August last year and were virtually unchanged from the previous month.

WHEAT STOCKS UP 13 PERCENT

Montana wheat stocks in all storage positions on September 1, 1987, totaled 212 million bushels, up 13 percent from a year ago. The current stocks level is the second highest on record.

Winter wheat stocks totaled 105.6 million bushels -- up 9 percent from last year, and all spring wheat totaled 106.4 million, up 18 percent from September 1, 1986.

Barley stocks in all positions reached 92.6 million bushels. There were no comparable stocks estimate made for barley in September of 1986.

Nationally, wheat stocks in all positions on September 1, 1987, total 2.96 billion bushels, 6 percent less than stocks on hand September 1, 1986. Off-farm stocks are placed at 1.81 billion bushels, or 61 percent of all stocks. The off-farm level is 3 percent less than a year earlier. Wheat stored on farms is 1.15 billion bushels, down 11 percent from September 1 last year.

Durum wheat stored in all positions on September 1, 1987, is placed at 147 million bushels, down 17 percent from storages on September 1, 1986. Farm stocks total 94.1 million bushels, down 25 percent from last September 1. The indicated June-August 1987 disappearance from all positions is 38.5 million bushels, off one percent from the same period a year ago.

Old crop corn stored in all positions on September 1, 1987, is estimated at 4.88 billion bushels. Of the total stocks, 2.28 billion bushels were stored on the farm and 2.60 billion bushels were stored off the farm. Indicated disappearance from all storage positions during June-August 1987 totaled 1.45 billion bushels, up 53 percent from the comparable period last year.

HOG INVENTORY UP 9 PERCENT

Inventory of all hogs and pigs on September 1, 1987, in the 10 states conducting quarterly hog surveys is estimated at 42.8 million head, 9 percent above last year. This is 2 percent larger than September 1, 1985, and the highest September 1 inventory since 1984.

The June-August 1987 pig crop was 17.5 million head, 11 percent above last year and 3 percent more than two years ago. There were 2.26 million sows that farrowed during June-August, up 11 percent from a year earlier and 3 percent more than the same period two years ago.

Hog producers in the 10 quarterly states intend to farrow 2.31 million sows during September-November of this year. This is up 7 percent from the actual farrowings during the comparable period in 1986, and 2 percent above 1985. Farrowing intentions for the December 1987-February 1988 quarter are 2.11 million head, 8 percent above a year earlier and 13 percent more than two years earlier.

QUARTERLY EGG PRODUCTION UNCHANGED FROM 1986

Montana's poultrymen produced 52 million eggs during the June-August quarter equaling output for the same period last year, but down 2 percent from the previous quarter. The average number of layers on hand, at 788,000, is down about 1 percent from 1986. The rate of lay on September 1 averaged 66.0 eggs per 100 layers compared with 65.6 in 1986.

The nation's laying flocks produced 17.2 billion eggs during the June through August 1987 quarter, up 1 percent from the 17.0 billion produced during the corresponding quarter a year ago. Number of layers for the quarter averaged 277 million, 2 percent greater than the 273 million a year earlier.

All layers on September 1, 1987, totaled 278 million, up 2 percent from the 273 million a year ago. Layers on September 1 consisted of 242 million for table eggs and 36.6 million layers for hatching eggs. Rate of lay on September 1, for all layers, averaged 67.2 eggs per 100 layers, compared with 67.5 a year earlier.

Meat Consumption Patterns Change

MONTANA FARMERS HARVEST LARGE CROPS

Farmers expect to harvest 144.5 million bushels of wheat this year, up 4 percent from last year, and a crop that ranks well above the 10 year average of 129.7 million. Acres for harvest at 4.5 million are 5 percent below last year and 8 percent below the 1977-86 average. The expected yield of 32.1 bushels per acre is the second highest on record.

Winter wheat production at 72.0 million bushels is up 13 percent from 1986, hard spring wheat at 66.7 million is down 5 percent, and durum at 5.8 million is up 4 percent.

For the nation, total wheat production is forecast at 2.11 billion bushels, up 1 percent from 1986 but down 1 percent from the August 1 forecast. Durum production is expected to be down 5 percent from both 1986 and August 1. Other spring wheat is down 3 percent from 1986 and 1 percent from August 1.

Montana's record large barley crop of 94.6 million bushels is unchanged from a month ago and is 11 percent larger than the 1986 crop. Oats production is forecast at 6.24 million bushels compared with 4.14 million last year. Production of all hay at 4.1 million tons is down 5 percent from 1986. Sugarbeet producers expect to harvest 1,082,000 tons in 1987 compared with 1,020,000 tons last year.

AUGUST PRICES

The 1987 August All Farm Products Index of Prices Received by Montana farmers and ranchers increased 6 points from July. The index, at 139 percent of its 1977 average, stands 17 points higher than one year ago. Much of this overall increase was due to stronger livestock prices as crop prices for the period generally declined.

The Livestock and Products Index increased 14 points from July to reach 171 for August. All prices for commodities measured in this index increased, with the exception of wool, which remained unchanged. The largest monthly increase in livestock commodities were for beef cattle at $58.50/cwt, up $6.60 and lambs, $82.00/cwt., up $3.50. The August Livestock and Products Index was 27 points higher than one year ago.

The August Crops Index decreased one point from July to 104 percent. Prices for durum, barley, oats and hay were lower in August, while winter and spring wheat prices were higher. The August All Crops Index was 5 points higher than one year ago.

CONSUMERS SHIFT MEAT PREFERENCES

U.S. consumers have changed the mix of meats they buy at the supermarket. Beef and veal consumption fell 16 pounds per person from 1976-86; pork consumption, however, rose 4 pounds and poultry consumption jumped 21 pounds.

Part of the pattern change is due to the relative price of beef and veal, pork, and poultry. Pork and poultry prices have increased much less than beef and veal. During the 10-year period, beef and veal prices jumped 65%; pork 37%, and poultry, 49%. In relation to beef and veal, poultry prices have declined.

MONTANA THIRD IN CRP ACRES

Montana farmers and ranchers have enrolled a total of 1,762,000 acres in the Conservation Reserve Program (CRP) after five signup periods.

This is the third highest acreage in the nation following Texas and Kansas. Acres signed-up represent 20.5 percent of Montana's highly erodible cropland and about 11 percent of the total cropland. Average rental price paid to Montana participants was $37.31 per acre.

Counties are limited by program rules to enrolling no more than 25 percent of their total cropland. This is to limit adverse economic impact in those counties. Counties at or near the 25 percent level are Carter, Fallon, Golden Valley, Musselshell and Petroleum.

The U.S. is half way to its goal of signing 40-45 million acres of highly erodible cropland into the 10-year Conservation Reserve Program. In the fifth signup, conducted last month, farmers bid an additional 5,288,694 acres into CRP. USDA accepted 90 percent of the 5,862,948 acres offered. The 10 states bidding in the most land in this 5th signup were North Dakota, Montana, Kansas, Texas, South Dakota, Minnesota, Missouri, Iowa, Oklahoma, and Colorado, in that order.

Nearly 23 million acres are now in the CRP Program. Of these, 17,707,306 acres were signed in the first four signups (3 last year and 1 earlier this year). There are 101,535,800 highly erodible U.S. cropland acres eligible for the program; of those, 22.6% -- 22,996,000 -- are now in the CRP Program.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 163,000 gallons of ice cream during July -- 26 percent less than in July 1986. Butter output for July totaled 97,500 pounds which was down 11 percent from last year. Creamed cottage cheese production at 327,000 pounds was down 9 percent.

Nationally, butter production was 79.1 million pounds, 1 percent below July last year and 5 percent below June 1987.

Creamed cottage cheese production was 58.2 million pounds, 8 percent below last year and 2 percent below June 1987.

Ice cream production, at 93.6 million gallons was up 2 percent from July 1986. Ice milk production was 37.0 million gallons, up 5 percent from last July. There was 5.41 million gallons of sherbet produced, down 6 percent from July 1986.

LIVESTOCK SLAUGHTER

Montana slaughter plants produced 1.7 million pounds of red meat in July 1987. This production was up 2 percent from the previous month and is down 10 percent from July 1986.

The number of cattle slaughtered, at 2,100 head was down 500 head from last year. Total liveweight of these cattle was down 12 percent from one year ago. Hog slaughter, at 2,200 head, was down 8 percent from last year and total liveweight was 6 percent below last year.

Nationally, commercial red meat production in July 1987 totaled 3.16 billion pounds, down 4 percent from July 1986. January - July red meat production, at 21.9 billion pounds, was down 4 percent from last year. The percentage changes from 1986 accumulated production by individual components were: Beef, down 5; Veal, down 17; Pork, down 3; Lamb and Mutton, down 9. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

CATTLE ON FEED IN 7 STATES UP

Cattle and calves on feed August 1 for slaughter market in the 7 states preparing monthly estimates totaled 6.69 million head, up 6 percent from a year ago and 4 percent above August 1, 1985.

MARKETINGS of fed cattle during July totaled 1.69 million head, slightly above last year and 1 percent above July two years ago. This is the greatest number marketed during July since 7 state estimates were begun in 1972.

PLACEMENTS of cattle and calves on feed in the 7 states during July totaled 1.26 million, down 18 percent from last year but 17 percent above July 1985. NET PLACEMENTS for July, of 1.19 million, are 20 percent below last year but 17 percent above July two years ago.

OTHER DISAPPEARANCE totaled 74 thousand head, compared with 64 thousand during July 1986 and 61 thousand during July 1985.

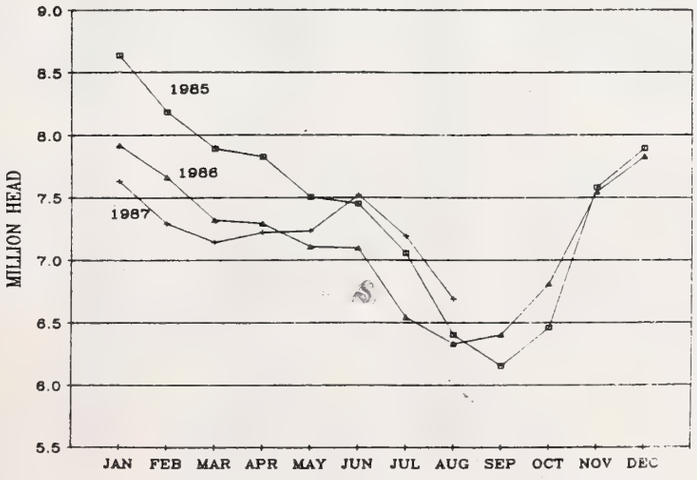
7 STATES



NUMBER OF WORKERS UNCHANGED - WAGES UP

During the week of July 12-18, 1987, there were 3.47 million people working on farms and ranches in the United States. This number was unchanged from July 1986. The workforce was comprised of 1.35 million self-employed farm operators, 587,000 unpaid workers, and 1.27 million workers hired directly by farm operators. Agricultural service employees accounted for the remaining 258,000 workers.

The wage rate for all workers hired directly by farm operators was $4.78 per hours, up 21 cents from July last year. Workers paid on an hourly basis earned $4.59 per hour compared with $4.46 last July. Field workers received an average of $4.60 per hour, up 21 cents from the July 1986 week. Livestock workers earned $4.29 per hour compared with $4.15 a year earlier.

During the July survey week, self-employed farm operators worked an average of 47.1 hours, 0.2 hours less than the comparable week in 1986. Unpaid workers averaged 39.0 hours, 0.1 hour less than last year. Hired employees worked 37.9 hours compared with 37.0 hours during July of last year.

Benefits, such as housing and meals, were provided to 45 percent of the hired workers during the July 1987 survey week. Data from the 1986 farm costs and returns survey showed that the value of perquisites including insurance and retirement benefits, FICA and other compensation taxes, housing, and other non-cash benefits represented 14 percent of the total farm and ranch labor expenditures.

FARMLAND VALUES

After falling for 5 straight years, U.S. land values showed some stability in early 1987. Surveys taken since February indicate that the downturn may have been halted. A May 1 survey of rural appraisers and several surveys by Federal Reserve Banks in April noted a leveling in values in areas where values were still falling late last year. As of February 1, 1987, the value of U.S. farm and ranch land averaged $548 an acre, down from $595 a year earlier and 33 percent below the 1982 peak of $823.

Optimism about the land market stems from expectations of another year of high net cash income and low interest rates. Net cash income is expected to rise mainly because of reduced expenditures and higher Government payments, which will offset lower commodity receipts. Interest costs will decline with reduced farm debt and lower rates. Although interest rates may climb this year, they are below 1986 levels. Higher net cash income and reduced interest rates on farm mortgages will enable more farmers to finance land purchases. Also, high rent-to-value ratios may attract nonfarm investors to the farm real estate market.

The large supply of farmland on the market could put downward pressure on values. Although prices were maintained on land sold by the Farm Credit System early this year, millions of acres acquired by lenders remain to be disposed of, and new land is still being added to lender inventories. In addition, downward pressure on values could intensify if price supports or other Government programs are cut back, because much of the anticipated rise in farmers' net cash income this year is based on Government payments.

Overall, farmland values for the remainder of 1987 and early 1988 probably will continue to show stability. In the longer run, values will be influenced by technological changes and forces in the U.S. and global economy. Farmland values probably will increase somewhat toward the end of the decade, but large changes are not expected.

20 STATE EGG PRODUCTION & LAYER NUMBERS UP

Laying flocks in the nation's 20 major egg production states produced 4.80 billion eggs during July 1987, up 1 percent from the 4.75 billion produced a year ago. Production included 4.19 billion table or commercial type eggs and 610 million hatching eggs. The number of layers producing table and hatching eggs during July averaged 229 million compared with 227 million a year ago. Egg production per 100 layers for the laying flock was 2,093 eggs compared with 2,095 for 1986.

All layers on August 1, 1987, in the 20 states totaled 230 million, 1 percent above the 227 million a year earlier. The 230 million layers consisted of 199 million for table or commercial type eggs and 31.8 million for hatching eggs. Rate of lay on August 1, 1987, for all layers, averaged 66.9 eggs per 100 layers, the same as a year ago.

During the 3-month period, March through May 1987, the 20 monthly states produced 83.6 percent of the U.S. egg production. If producers in the remaining 30 states not surveyed on August 1 followed the same production trend indicated by the 20 states, U.S. egg production would have totaled about 5.74 billion for July compared with 5.70 billion for July 1986. The monthly states accounted for about 83.2 percent of the average number of layers during the last quarter. If producers in the remaining 30 states followed the same trend, the average number of layers in the U.S. during July would have totaled about 276 million, compared with 272 million a year ago.

JULY MILK PRODUCTION - 21 STATES

Milk production during July 1987 in the 21 selected states totaled 10.4 billion pounds. This was about the same as production in these same states a year earlier.

During the April-June period the 21 selected states produced 85.2 percent of the U.S. production. If producers in the remaining 29 states not surveyed for August 1, followed the trend shown by the reporting states, the U.S. milk production would total about 12.2 billion pounds for July. Production per cow in the 21 selected states averaged 1,188 pounds during July, 29 pounds above July 1986.

The average number of milk cows during July 1987 in the 21 selected states was 8.79 million head, 14 thousand head more than a month earlier but 247 thousand head fewer than July 1986.

SMALL GRAIN PROSPECTS EXCELLENT

The 1987 Montana **wheat** crop is forecast at 142.0 million bushels, up nearly 3 percent from a year earlier and the largest crop since 1982. Producers expect an average yield of 31.6 bushels per acre compared with 29.1 last year and 33.6 in 1982. **Winter wheat** production forecast at 72.0 million bushels moved up 6.0 million bushels from July's forecast and is 13 percent larger than the 1986 crop. The average yield is 36.0 bushels per acre compared with 32.0 bushels realized last season. The first forecast of **hard spring wheat** is 64.4 million bushels with an average yield of 28.0 bushels per acre. A year ago producers harvested 70.2 million bushels and averaged 27.0 bushels per acre. **Durum wheat** production at 5.6 million bushels is up 30 percent from 1986. The expected yield, at 28.0 bushels per acre, is one bushel above the 1986 average.

Montana's **barley** crop is forecast at a record high 94.6 million bushels, up 11 percent from the previous record set in 1986. Yield is forecast at 43.0 bushels compared with 39.0 a year ago. **Oats** production, at 6.24 million bushels, compares with 4.14 million bushels produced in 1986. **All hay** production of nearly 4.1 million tons is down 5 percent from last year. **Sugarbeet** growers expect to harvest 1,082,000 tons in 1987 compared with 1,020,000 tons in 1986. **Corn** production is projected at 1.15 million bushels - nearly 23 percent less than last year's production. **Dry bean** production at 98,000 cwt. is up 1 percent from a year ago.

Nationally, **all wheat** production is forecast at 2.13 billion bushels, up 2 percent from 1986. Harvested area for grain, at 55.4 million acres is off 9 percent from a year ago. Yields are expected to average 38.4 bushels per acre, 4.0 bushels above last year's average.

The U.S. **barley** crop is expected to be 518.4 million bushels, down 15 percent from last year's record crop. Harvested acreage is expected to be 10.1 million acres compared with 12.0 million in 1986. Average yield is forecast at 51.2 bushels per acre, slightly above 1986.

WHEAT VARIETIES

Redwin remains top winter wheat variety: For the fifth year Redwin continues to be the most prominent variety of winter wheat grown in Montana. It was seeded on 457,200 acres or 21.8 percent of the state's 1987 winter wheat acreage. This is down nearly 100,000 acres from last year, but remains by a wide margin ahead of the second most popular variety. Redwin is grown for its winter hardiness and excellent protein level. It also has excellent milling and baking qualities.

Newana remains the number one spring wheat variety: Newana moved into first place in 1983. This year it is once again the most popular spring wheat grown in Montana. It was planted on 520,000 acres or 21.7 percent of the spring wheat acreage. Newana is a bearded semi-dwarf variety, resistant to loose smut and stripe and stem rust, but is susceptible to leaf rust.

Vic remains top durum variety: Vic continues to be the most popular durum variety grown in Montana with 112,200 acres or 53.4 percent of the total planted acreage. This is up nearly 24 points from 1986. Vic is of medium height with good disease resistance to stem rust and rootrot. It also shows moderate resistance to leaf rust and blackpoint.

This report was made possible by funds provided by the **Montana Wheat & Barley Committee.**

MONTANA BARLEY VARIETIES

The leading barley variety grown in Montana in 1987 is Hector, accounting for nearly one-third of all planted acreage, according to a June survey of growers. This is the sixth straight year the feed variety has been first. It was planted on 32.9 percent of the total barley acreage. In second place is Klages, the number one malt variety, increasing 18 percent from last year's planted acreage. Piroline, a variety formerly recommended for malt, is the third most popular variety. Clark, a malt variety, moved from third to fourth place, dropping its acreage 38 percent from last year. Hector, Klages, Piroline, Clark, and Harrington accounted for 80 percent of Montana's 1987 planted barley acreage.

MILK PRODUCTION DOWN

Montana dairymen produced 85 million pounds of milk in the second quarter of 1987. This production was 2 percent less than the production for the April-June period of 1986. Milk cow numbers declined from 27,000 head to 25,000 head, but production per cow was up more than 5 percent from last year.

On July 1, grain and other concentrates fed averaged 14.5 pounds per milk cow, up one-half pound per day per head. The average cost of these concentrates was down from $7.05 in 1986 to $6.20/cwt. this year.

Nationally, the quarterly production of milk for the U.S. was 37.3 billion pounds, 3 percent below the April-June period last year. The average number of milk cows in the U.S. during the April-June quarter was 10.4 million head, down 5 percent from the same period in 1986.

M = American Malting Barley Improvement Association recommended malting varieties for Montana 1987.

RAINS BOOST CROP PROSPECTS

The July 27th crop-weather report had mostly good news for Montana farmers and ranchers. Timely rains replenished soil moisture supplies and crops were rated mostly good to excellent. Harvest of grain and hay was delayed by the rains, but immature crops greatly benefited. We now expect that the grain crops have sufficient moisture to mature without undue stress.

Winter wheat was 52 percent ripe and 8 percent harvested. Maturity is running a week or so ahead of normal for this date. Spring wheat, barley and oats were about 10 percent ripe with harvesting just getting underway.

Hay harvest continued about on a normal schedule -- 21 percent of the alfalfa second cutting and 70 percent of the wild hay had been cut.

Grasshoppers continue to plague the state. Damage is heavy in some areas, but most producers are optimistic about prospects for good grain yields with higher protein content than a year ago.

We now need some sunny weather to mature the crops and allow the combines to roll!

MINK PELT PRODUCTION DOWN

Mink pelt production in the United States in 1986 totaled 4.08 million pelts, down 2 percent from 1985, Wisconsin, the major mink state, produced 1.13 million pelts.

By color class, the number of pelts as a percent of the total U.S. production was: standard - 39.5 percent; Demi-buff - 14.0 percent; Ranch wild - 10.2 percent; Mahogany - 9.0 percent; Pastel - 7.1 percent; Gunmetal - 5.4 percent; and white - 3.5 percent. The remaining color classes accounted for 11.3 percent.

Mink pelts sold during the 1986 crop year were valued at 158.6 million dollars, up 36 percent from 1985. The average price per pelt for the 1986 crop year was $38.90,compared with $28.00 in 1985 and $30.80 in 1984.

Female mink bred to produce kits in 1987 totaled 1.07 million, down 1 percent from 1986. Females bred for the two major color classes are: Standard - 498 thousand and Demi-buff - 120 thousand. Females bred in the leading states are: Wisconsin - 295 thousand; Minnesota - 140 thousand; and Utah - 138 thousand.

There were 977 mink farms producing pelts in 1986 compared with 1042 the previous year. Leading states were Wisconsin with 228 farms, Minnesota with 155 and Utah with 121 farms. Fourteen percent of the mink farms also raised fox, the same percentage as last year.

LIVESTOCK SLAUGHTER UP

Montana slaughter plants produced 1.6 million pounds of red meat in June 1987. This production was up 11 percent from the previous month and is up 3 percent from the June 1986 production.

The number of cattle slaughtered, at 1,900 head, was down about 300 head from last year, but the total liveweight of these cattle was up 11 percent because average slaughter weights increased. Hog slaughter, at 2,000 head, was down 13 percent from last year and total liveweight was 14 percent below last year.

Nationally, commercial red meat production in June 1987 totaled 3.10 billion pounds, down 2 percent from June 1986. January-June red meat production, at 18.7 billion pounds, was down 4 percent from last year. The percentage changes from 1986 accumulated production by individual components were: Beef, down 4; Veal, down 17; Pork, down 4; Lamb and Mutton, down 10. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

JAPAN REMAINS OUR BEST CUSTOMER

Although more than 150 countries import U.S. agricultural products, our top ten foreign customers accounted for 60 percent of U.S. export sales last year.

Japan was in its usual first place position, taking $5.1 billion worth of American farm goods. Its purchases included more than $1 billion in U.S. coarse grains, $877 million in oilseeds, and $667 million in red meats.

The Netherlands, which also trans-ships to other nations, was the destination of record for around $2.1 billion in products from U.S. farms. Oilseeds, feeds, and fodders were the major items.

Canada spent around $1.5 billion, roughly one-third of that on American fruits and vegetables. Other billion-dollar buyers were South Korea, Taiwan, Mexico, and West Germany.

Adding in Egypt, Italy, and Spain, the ten largest markets took $15.5 billion worth of U.S. agricultural products. Our total farm exports in 1986 came to $26.0 billion.

For the first time in several years, the Soviet Union was not among the top ten. Its purchases dropped from $1.9 billion in 1985 to $658 million in 1986.

CATTLE ON FEED UP

Cattle and calves on feed July 1, 1987 for slaughter in the 13 quarterly states totaled 8.67 million head, up 9 percent from July 1 last year but unchanged from 1985.

The cattle on feed inventory included 5.60 million steers and steer calves, 14 percent above last year and 7 percent above 1985. This group represented 65 percent of the total July number on feed compared with 62 percent in 1986. Heifers and heifer calves accounted for 3.03 million, virtually unchanged from a year ago but 10 percent below April 1, 1985.

Placements of cattle and calves on feed during the April-June quarter totaled 5.96 million, up 14 percent from last year and 15 percent above the comparable period in 1985. Other disappearance of 423 thousand head leaves net placements at 5.54 million.

Marketings of fed cattle for slaughter during April-June totaled 5.67 million, 3 percent less than a year ago and 2 percent below 1985.

WINTER WHEAT PRODUCTION

Montana wheat farmers expect to harvest 66.0 million bushels of winter wheat -- an increase of 3 percent from last year. The July 1 forecast is 11 percent greater than the June 1 estimate due to an increase in yield to 33 bushels and an upward revision in harvested acres.

In Montana, acres of winter wheat for harvest at 2.0 million are unchanged from 1986.

Nationally, winter wheat production is forecast at 1.57 billion bushels, 4 percent above the 1986 production.

1/ Terminals, mills, interior elevators. 2/ Montana stocks for winter wheat and all spring wheat separately are made possible through funds provided by the Montana Wheat and Barley Committee. 3/ Included in all spring wheat and all wheat. 4/ Not included in order to avoid disclosing individual operations. 5/ Included with other states starting April '86. 6/ Per program modifications: stocks estimates for barley and oats will only be made as of June 1 each year.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 119,000 gallons of ice cream in May 1987, 5 percent more than the previous month but 23 percent less than last year. Creamed cottage cheese output at 317,000 pounds was 12 percent below April and 5 percent below the previous year. Butter production totaled 114,000 pounds, 16 percent less than the previous month and 27 percent less than a year ago.

U.S. HOG INVENTORY UP 7 PERCENT

Inventory of all hogs and pigs in the U.S. on June 1, 1987, is estimated at 52.3 million head, 7 percent above a year ago and slightly above June 1, 1985.

--Breeding inventory is 10 percent above last year and slightly above two years ago.

--Market hog inventory is 7 percent above a year ago but nearly the same as two years ago.

The December 1986 - May 1987 U.S. pig crop was 43.2 million head, 7 percent above last year and 2 percent above two years ago.

June-November farrowings are expected to increase 8 percent from actual farrowings during the same period in 1986 and 3 percent above two years ago.

U.S. CATTLE COUNT DOWN 2 PERCENT

The nation's cattle herd at 112 million head is the smallest since mid-year estimates were begun in 1973 and is down 2 percent from a year ago. However, beef cows are fractionally higher and beef cow replacement heifers are unchanged from June 1986 which may mean the downturn is slowing or at an end.

Of the total inventory, cows make up 45.0 million (34.6 million are beef), heifers 17.1 million, steers 15.7 million, bulls 2.2 million, and calves 32.1 million head.

The total calf crop is expected to be 40.7 million head.

State estimates of cattle and calves are made once a year in January.

SWEET CHERRY PRODUCTION INCREASES

Montana's 1987 sweet cherry production is forecast to be 7.0 million pounds as of July 1, an increase of 119 percent over last year. The production estimate is 24 percent under 1985.

For the U.U., sweet cherry production is estimated to be 379.2 million pounds, 38 percent above 1986 and 43 percent above 1985.

CROP-WEATHER SITUATION
(for week ending June 21)

Montana's crops are being maintained fairly well by frequent but spotty shower activity and are in mostly good to excellent condition. However, soil moisture shortages were developing the middle of June, and there was little reserve to sustain crops in the event of hot and windy weather.

Crop progress is ahead of both last year and average which will help crops get through the hot weather that normally occurs in July.

Grasshopper damage appears to be a major threat to both crops and ranges expecially in the eastern parts of the state. Considerable damage has already occurred in those areas.

WHEAT SITUATION and OUTLOOK

The first indication of 1987 U.S. wheat production came in January when winter wheat farmers said they had seeded only 48 million acres, down almost 6 million from 1986 and the smallest since 1978. In March, spring wheat producers said they also intended to reduce planted area by an additional 1.5 million acres. This means that 1987's overall wheat area may be down 10 percent from 1986 and the smallest in 14 seasons. The cutback came about because the sixth successive acreage reduction program received heavy support from farmers, along with growing participation in the Conservation Reserve Program.

Generally mild weather conditions left minimal damage to winter wheat and aided swift seeding of spring wheat. The outlook suggests that 1987's yields may be up considerably from last season, producing a crop of between 2.0 and 2.2 billion bushels, compared with 2.09 billion in 1986. This illustrates weather's significant impact on efforts to relieve burdensome commodity supplies.

The expected larger harvest will maintain U.S. wheat supplies at 3.97 billion bushels, just below the all time high 4.01 billion bushels. Thus, the outlook for the 1987/88 marketing year hinges on expected increased demand. However, domestic disappearance is likely to show a decline, because the expected wheat/feed grain price spread will favor larger use of coarse grains in livestock feed rations. So, exports will be the pacesetter and the most important factor to aid the lowering of excess stock levels.

With the prospect of increased world wheat trade in 1987/88 and renewed U.S. selling to the Soviet Union and Chinese markets, the initial U.S. export forecast is 1.23 billion bushels -- a 20 percent increase over last season. Expectations of brisk early-season shipments from large Export Enhancement Program sales, in combination with the reduced marketable supplies of old-crop wheat, suggest loan-level harvest-time farm prices could strengthen as 1987/88 progresses. The seasons's farm price may average between $2.30 and $2.60 a bushel, compared with $2.40 last year.

Global 1986/87 wheat output hit a record 528 million metric tons. The 1987/88 season seems to point to another large harvest, although weather and reduced planting in some areas may preclude a new record. Trade will likely expand, particularly with a major harvest shortfall in the Soviet Union, but may not top the 100 million tons of the 1983/84 and 1984/85 seasons. Aggressive competition among exporters will likely continue as each seeks a share of the moderately expanding market.

Montana State Library
3 0864 1006 7714 8

WHEAT EXPORTS RISE SHARPLY

U.S. wheat and flour exports for fiscal 1987 are forecast at 31.3 million tons, up 11 percent from the previous forecast, and value is projected at $3.3 billion. Total world wheat trade is forecast to rise in fiscal 1987 due to increased import demand in China and the USSR. Much of the increase in U.S. sales is due to the Food Security Act of 1985 which lowered the loan rate and established the Export Enhancement Program (EEP). The EEP has allowed U.S. wheat and products to compete effectively in targeted markets where competitors previously undercut U.S. exports with subsidies. Largely because of the EEP, U.S. exports to Eastern Europe, China, the USSR and North Africa are expected to rise in fiscal 1987. The recent offer of 4 million tons of EEP wheat to the USSR is the largest initiative of the program. The grain agreement calls for shipments by the end of the fiscal year. Most of the 1 million tons of EEP wheat purchased by China is also expected to be shipped before the end of the fiscal year. With U.S. and foreign production and stocks remaining close to record levels, export markets will continue to be highly price competitive.

EGG PRODUCTION ABOVE LAST YEAR

Montana poultrymen produced 53 million eggs in the quarter ending May 31, 1987. The average number of layers on hand in the March through May period was down more than 1 percent from last year but a higher rate of lay pushed production 2 percent over the 1986 quarter.

The Nation's laying flocks produced 17.7 billion eggs during the March through May quarter, up 2 percent from the corresponding quarter a year ago. Layers for the quarter averaged 280 million, up 1 percent from the 277 million a year earlier.

All layers on June 1, 1987, totaled 277 million, up 1 percent from a year ago. Layers on June 1 consisted of 240 million for table eggs and 38 million layers for hatching eggs. Rate of lay on June 1, for all layers, averaged 67.4 eggs per 100 layers, compared with 68.1 a year earlier.

MORE BEEF TO JAPAN

Livestock, Dairy and Poultry exports are forecast at $4.8 billion in fiscal 1987, unchanged from last quarter's forecast, but an increase of $400 million from fiscal 1986. Exports are expected to rise in fiscal 1987 due to increased beef and veal exports to Japan and Brazil and poultry meat exports to Egypt, Iraq, and Japan. Beef exports to Brazil are the result of sales made to minimize the adverse effect of the Dairy Termination Program. EEP iniatives are expected to increase poultry sales to Egypt and Iraq.

CATTLE ON FEED IN 7 STATES

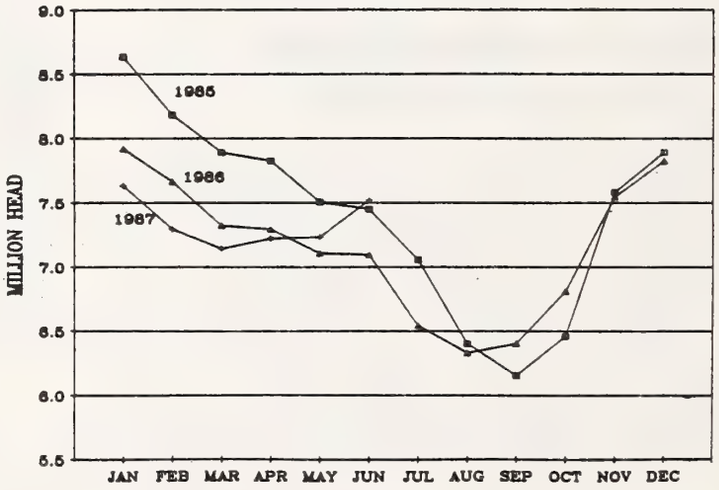
Cattle and calves on feed June 1 for slaughter market in the 7 states preparing monthly estimates totaled 7.52 million head, up 6 percent from a year ago and 1 percent above June 1, 1985.

Marketings of fed cattle during May totaled 1.52 million, down 7 percent from last year and 5 percent less than May two years ago.

Placements of cattle and calves on feed in the 7 states during May totaled 1.95 million, up 11 percent from last year and 17 percent above May 1985. This is the highest May placement total since 1978. Net placements of 1.81 million for May are 12 percent above last year and 17 percent above May two years ago.

Other disappearance totaled 143 thousand head, compared with 132 thousand during May 1986 and 128 thousand during May 1985.

CATTLE ON FEED
7 STATES



LIVESTOCK SLAUGHTER MAY 1987

Montana slaughter plants produced 1.5 million pounds of red meat in May 1987. This production was up slightly from the previous month, but was 15 percent less than the May 1986 production.

Cattle slaughter, at 1,800 head, yielded 15 percent less red meat than a year ago. The hog slaughter, also at 1,800 head, produced 24 percent less red meat than last year.

Nationally, commercial red meat production in May 1987 totaled 2.98 billion pounds, down 12 percent from May 1986. January-May red meat production, at 15.6 billion pounds was down 5 percent from last year. The percentage changes from 1986 accumulated production by individual components were: Beef, down 5; Veal, down 17; Pork, down 5; Lamb and Mutton, down 11. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

THE FARM ECONOMY MAY HAVE TURNED THE CORNER

There are signs that financial conditions affecting farmers may have finally begun to turn up. It appears that for the vast majority of agricultural producers, earnings on investments are now returning to levels consistent with the more stable, slow-growth 1960's and early 1970's.

"Good news amid bad" is often the situation during the initial stage of an ailing industry's recovery. This is because economic forces-such as a 60 percent fall in land values in the upper Midwest-also provide the foundation for eventual stabilization and recovery. In this case, the rebound will be based on farm real estate that has become a bargain compared with its price 4-5 years ago.

Land prices in the 1980's have fallen by one-half to two-thirds in parts of the western Corn Belt, and nearly two of every three stressed commercial-size farmers in the United States live in a 10-state region of the upper Midwest. Since this area has been the hardest hit by the farm economy crunch, it is a significant area to examine for signs of beginning recovery.

Therefore, an analysis was done on whether Midwest land values today can be supported by current crop prices and Government benefits. Data used come from the 1985 and 1986 USDA Farm Costs and Returns Surveys. The results are based on data received from approximately 400 corn and soybean farmers. Because the survey is probabilistically based, these 400 operators represent about 60,000 farms of similar size and type in Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Nebraska, Iowa, and Missouri.

The question analyzed was: Can management afford to pay current market values for farmland, given the production costs of this operation and current market interest rates? This question is critical to operators considering expansion or purchase of rented land, and to both operators and lenders examining the feasibility of debt restructuring.

HAVE LAND VALUES FALLEN ENOUGH IN RELATION TO CASH FLOW?

In 1987, for the first time since 1984, the typical corn/soybean farm in the Midwest could meet all cash expenses on a piece of land purchased at 11 percent interest with a 25 percent downpayment. For the sample of 400 farms, projected 1987 gross farm receipts average $112,400, including $25,100 in Government benefits. Total cash expenses, including interest on real estate, but not including principal repayment, are projected at about $112,000 per operation, so cash receipts would about equal cash expenses.

In contrast, survey data indicate that corn/soybean farms in the Midwest in 1984 averaged cash costs $41,200 higher than receipts.

Thus, the highest feasible ratio of real estate debt to value a farm can afford increased from about 35 percent in 1984 to about 75 percent in 1987, mainly because of the 40-45 percent decline in land values for the farms sampled. Although gross receipts per farm fell $20,000 between 1985 and 1987's estimated level, this is more than offset by a nearly $20,000 drop in real estate interest expense and an additional $10,000 decline in other cash expenses.

The importance of the large fall in land values during the middle 1980's, and the decline in interest rates that occurred during 1985 and 1986, is shown in the mirroring trend of declining interest burdens and the number of farms that can purchase land and still cover cash costs. Only about one in 10 corn/soybean farmers could have achieved positive cash flows from 1984 land purchases at market rates current then. But, by 1987, with the interest burden of buying a farm down over $30,000, three of five farms could fully meet the interest expenses associated with land purchases, assuming a 25-percent downpayment.

Farmland contracts providing seller financing are often available at interest rates of 7 to 10 percent. Projections indicate that most of the sample farms can meet interest payments, even on loans with no downpayment, if mortgage interest rates of 7-9 percent are available and land is priced at beginning 1987 values.

"It is, Sir, the people's Constitution, the people's government, made for the people, made by the people, and answerable to the people. The people of the United States have declared that the Constitution shall be their supreme law. We must either admit the proposition or deny their authority."

1/ Estimates for current year carried forward from earlier forecast.

MONTANA'S WINTER WHEAT PROSPECTS UNCHANGED

Montana's winter wheat production forecast on June 1 at 59.2 million bushels is unchanged from last month's estimate and down 7 percent from last year. Good moisture conditions last fall and a mild winter produced good stands this spring. Moisture was short and temperatures high until after mid-May. Good subsoil moisture in the main wheat growing areas kept the Montana crop from deterioration. The yield, forecast at 32 bushels per acre, is the same as last month. The current forecast of 32 bushels, compares with 32 in 1986; 16 in 1985; 27 in 1984; and the record high 38 in 1982.

Nationally, winter wheat production is forecast at 1.58 billion bushels, 2 percent above last month and 4 percent more than 1986. Yields are placed at 40.6 bushels per acre nationwide, second highest on record. Acreage for harvest, at about 39 million acres is unchanged from last month, but the expected yield is almost 1 bushel higher. Acreage for harvest is down almost 10 percent from last year, but projected yield is up almost 5 bushels per acre.

MONTANA FARM PRICES HIGHER

The Index of Prices Received by Montana farmers and ranchers in May was up 1 point* from April but 3 points above May a year ago.

Montana's All Farm Products Index was 144 percent of the January-December 1977 average. The small April to May increase reflects higher crop prices but generally lower livestock prices.

All crop items advanced except oats, which was down; and hay, which was unchanged. Steer and heifer prices, hogs and wool were the only livestock prices moving up.

The May U.S. All Farm Products Index of Prices Received by Farmers increased 4 points from April to 129 percent of its January-December 1977 average. Higher prices for beef cattle, hogs, corn, soybeans, and cotton were partially offset by lower prices for milk, eggs, and tomatoes. The index was 6 points above a year ago.

Meat animal prices were up sharply from a month earlier. Cattle and calf prices were at their highest levels since February and March 1980, respectively. The month-to-month gain in the hog price was $3.50 following a $3.40 increase from March to April. This brought the hog price to the highest level since September 1986. Prices of grains, oilseeds, and hay were up significantly from a month earlier.

Ratio 1/	77	77	80

1/ April 1986 Prices Paid Index. 2/ April 1987 Prices Paid Index

SWEET CHERRIES

Montana's sweet cherry crop is forecast to be 3,000 tons up 88 percent from last year's small picking. Pollination conditions were excellent and freeze damage, so far, has been minimal. For the nation, the crop is expected to be 150,700 tons, up 31 percent from last year.

LIVESTOCK and POULTRY OUTLOOK

Livestock and poultry producers are expected to have positive returns in 1987. Large supplies of grain, protein meal, and forage should moderate production costs. However, the fifth consecutive year of record-large total meat supplies probably will keep poultry and pork prices at or below last year's average. Reduced beef supplies should firm or improve prices received by many cattle producers in 1987.

Favorable feeding margins are likely to stimulate broiler, turkey, and hog production the most, with the cattle herd beginning to stabilize. Broiler production in first quarter was up 9 percent. The broiler hatchery supply flock will be 10 to 15 percent above last year this spring and summer, permitting continued production increases. Broiler output could increase nearly 9 percent this year with prices averaging in the upper 40-cent-per-pound range this summer and seasonally lower in the fall.

Red meat and poultry supplies are expected to be record large in 1987. Per capita retail weight consumption of red meat and poultry is expected to be about 216 pounds, up slightly from 1986. The increase continues a trend begun in 1982. Projected red meat and poultry consumption in 1987 is 12 pounds per person above the 1970-85 average. First-half supplies should be at or slightly below first-half 1986 levels. However, second-half production of red meat and poultry should be above a year ago.

First-quarter beef production was unchanged from a year ago as record heavy slaughter weights more than offset a 1 percent decline in cattle slaughter. As cattle numbers stabilize, the slaughter mix and thus average slaughter weights over all classes of cattle also shift. In the first quarter, a 2 percent increase in steer and heifer slaughter almost offset a 12 percent drop in cow slaughter. Beef cow slaughter was down 18 percent, while dairy cow slaughter declined 4 percent. Even sharper year-to-year reductions in cow slaughter, particularly dairy, will occur during the second and third quarters as measured against the large Dairy Termination Program (DTP) cow slaughter during these periods in 1986. Fed cattle marketings are expected to remain near the large levels of recent years. As the steer and heifer proportion of the slaughter mix rises relative to a year ago, so will average slaughter weights. During the 1980's, steer and heifer dressed weights have averaged about 200 and 110 pounds heavier than dressed cow weights, respectively.

PASTURES and RANGES IMPROVE

Montana's pastures and ranges were helped by rains and snow the last week of May. Drouth conditions that prevailed before that had retarded grass growth. Hardest hit was the Central district. Grasshoppers plagued the Eastern parts of the state where hatching conditions were ideal. Stockwater supplies are holding up well because of good carryover from last fall's rains. There has been little or no run-off this spring.

1986 COUNTY WHEAT ESTIMATES

The 1986 wheat county estimates are now available for distribution. We're publishing the "all wheat" figures in this publication, but estimates by class and cropping practice are available from the office upon request.

These estimates are the only county figures published for Montana. They are based on an acreage and production survey conducted last fall. About 5,300 questionnaires were tabulated including about 3,100 telephone calls made to producers in counties where mail returns were light. Thanks to those who provided information!

RAINFALL BOOSTS CROP PROSPECTS

Soaking rains during the past two weeks have improved the condition of Montana crops. Both winter and spring wheat were rated over 70 percent good to excellent on May 23 and recent widespread rains should further boost prospects. Pastures and ranges have also responded well to the improved moisture likely boosting the fair rating reported on the 23rd. More rain and sunshine will still be needed to maintain pasture grasses.

The timing for recent precipitation was very good. We saw some crops and pastures come under stress, but little permanent damage was done. Grasshoppers were hatching rapidly and feeding heavily on grains, hay and pastures and we had some reports of reseeding due to grasshopper damage. But, the cool, wet weather should slow the hatch and feeding activity.

Snow pack and streamflow is far below normal this year. How will this impact Montana agriculture? We expect a shortage of stream irrigation water. This will certainly impact farmers and ranchers who depend on this source -- especially if we receive less than normal rainfall during the next month. Overall, however, we don't expect this shortage of irrigation water alone would cause a disastrous reduction in Montana crop or pasture production. About 20 percent of the harvested cropland in Montana is irrigated and part of that acreage uses water from reservoirs that have adequate supplies.

Could we still see a drought comparable to 1985? It's possible, but very unlikely because subsoil moisture supplies are much better than in '85. In June 1985 we had hot, windy weather, little rainfall and very short subsoil moisture. Normal June weather could still result in good to excellent crops this year.

JUNE SURVEY UNDERWAY

We're now heading into our busy mid-year survey period. That means over 2,000 Montana farmers and ranchers will be contacted during the first two weeks of June to update the 1987 numbers. They will be contacted by phone, mail or by personal interview. Questions asked will cover planted acreage, grain stocks and livestock numbers.

The new numbers will include actual acres planted to all crops. The last information on spring grown crops was provided by the March intentions report. Those intentions may have changed due to weather, participation in government programs or for a number of other reasons.

It's important that we have accurate numbers to help farmers plan their marketing strategy. Participation remains voluntary for these surveys, but remember, accurate information depends on good cooperation, and you need accurate information to make those vital farm and ranch decisions.

NUMBER OF WORKERS DOWN FROM 1986 - WAGES UP

During the week of April 12-18, 1987, there were 2.82 million people working on farms and ranches in the United States. The count of workers was down 3 percent from a year ago. Included in the work force were 1.31 million self-employed farm operators, 445,000 unpaid workers, and 885,000 workers hired directly by farm operators. The additional 188,000 workers were agricultural service employees.

Hired farm workers received an average of $4.90 per hour during the April 1987 survey week, up 19 cents from a year earlier. Workers paid on an hourly basis earned $4.67 per hour compared with $4.52 in April 1986. Field and livestock workers earned $4.70 and $4.32, respectively. Last year their wages were $4.58 and $4.26.

Self-employed persons worked an average of 43.6 hours during the April 1987 survey week, the same as a year earlier. Unpaid workers averaged 36.1 hours, 1.4 hours more than last year. Hired employees worked 40.3 hours, up 1.5 hours from April 1986.

Perquisites and other benefits such as housing and food were provided to 46 percent of the hired workers. Housing was provided to 13 percent of the workers, unchanged from last year.

MAY 1 POTATO STOCKS

Montana potato stocks on hand May 1, 1987 totaled 400,000 cwt, up 800 percent from a year ago. The stocks on hand were 18 percent of production.

Nationally, May 1, 1987 potato stocks totaled 57.0 million cwt in the 15 fall storage states. This is down 13 percent from last year but 9 percent above two years ago. Nineteen percent of fall potato production is still on hand, the same percentage as a year ago. Eastern and Central States are down sharply from last year, while Western states show 1 percent more potatoes stored.

The three Eastern states held 3.50 million cwt, down 57 percent from last year and 33 percent below two years ago. Maine had 3.00 million cwt on hand, 58 percent less than last May. New York and Pennsylvania are practically finished for the season.

The six Central states' potato storage stands at 7.79 million cwt, down 34 percent from last year and 9 percent under two years ago. North Dakota stocks at 3.00 million cwt are down 21 percent; Wisconsin holdings of 2.30 million cwt are off 28 percent; while Minnesota's 1.80 million cwt dropped 42 percent from a year ago. Michigan, with only half a million cwt of potatoes on hand, was 67 percent below last year and Nebraska with 190 thousand cwt was off 30 percent.

The Western states held 45.8 million cwt of potatoes on May 1, 1987, up 1 percent from last year and 18 percent above two years ago. Idaho stocks of 25.5 million cwt are up 13 percent; Oregon storage with 5.80 million cwt is at last year's level; and Washington's 8.70 million cwt are down 10 percent. Colorado storage with 4.25 million cwt and California stocks of 1.10 million cwt are down 21 and 42 percent, respectively.

APRIL LIVESTOCK SLAUGHTER

Montana slaughter plants produced 1.5 million pounds of red meat in April 1987. This production was slightly higher than the previous month, but was 8 percent less than April 1986 production.

Cattle slaughter, at 1,800 head, was down 22 percent from last year. Hog slaughter was down 8 percent with 2,200 head slaughtered.

Nationally, commercial red meat production in April 1987 totaled 3.16 billion pounds, down 9 percent from April 1986. January-April red meat production, at 12.6 billion pounds, was down 3 percent from last year. The percentage changes from 1986 accumulated production by individual components were: Beef, down 2; Veal, down 15; Pork, down 3; Lamb and Mutton, down 11. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

SURVEY RESULTS

FARMLAND VALUES

Farmland values are watched closely by those both in and out of agriculture. They are a measure of the general health of the agricultural economy. That's why this year's figures were a shock to many who expected a leveling off of the declines we've seen in recent years. This year's report pegged Montana farmland at an average of $167 per acre on February 1st -- down a sharp 18 percent from a year earlier. This was a larger decline than we expected based on much improved production and income in 1986.

The $167 per acre figure for Montana land is the lowest value in 10 years.

Montana's 18 percent decline was much larger than the U.S. reduction of 8 percent and exceeded declines in surrounding states.

Regionally, only the Northeast showed an increase in 1986. The largest declines occurred in the Lake States, where farmland values fell 15 percent, and the Delta, where they dropped 16 percent. In the Corn Belt and Northern Plains, which suffered severe losses in the past 5 years, declines appear to be moderating. Also, there are reports of stable values in some areas of the Corn Belt.

The continuing downturn in values reflects the large acreage of land offered for sale relative to demand, concern about lower crop prices, and uncertainty over farm programs. These factors tend to offset the effects of relatively high cash farm income, lower interest rates, and reduced operating expenses.

SURVEY RESULTS

WINTER WHEAT PRODUCTION OFF 8 PERCENT

Montana's winter wheat crop is expected to total 59.2 million bushels -- 8 percent less than last year. The forecast is based on conditions reported by farmers as of May 1. The forecast yield of 32.0 is about normal for the state and the same as last year. Farmers reduced seeded acreage last fall because of wet conditions and anticipated government programs. Acres for harvest at 1.85 million are down 150,000 acres from last year.

Nationally, the May 1 winter wheat forecast, at 1.55 billion bushels, is up 2 percent from last year. Based on conditions as of May 1, growers expect to harvest about 39 million acres, down 10 percent, and the lowest level since 1978. All major winter wheat states indicated fewer acres for harvest. Texas and Oklahoma were down 11 percent and 14 percent respectively on production, while Kansas, Colorado and Nebraska indicated higher production this year, up 21 percent, 16 percent, and 5 percent respectively. All three states expect 40 bushels per acre yields or more.

Includes value of milk fed to calves.

PASTURE & RANGE FEED CONDITION

The mild, open winter coupled with last fall's good moisture greened up pastures and ranges early this year. However, growth was slow due to cool weather and very little moisture until mid-March. Rain and snow the last of March and the first part of April promoted good growth across most of the State. Warm weather and wind during the last week of April depleted topsoil moisture supplies and slowed pasture, range and hay growth. Farmers and ranchers have vivid memories of the 1985 drought year still fresh in their minds. Moisture is badly needed to promote growth and also provide stockwater for good pasture feed.

TOPSOIL MOISTURE 59 PERCENT SHORT

The crop-weather report released on May 9th had one urgent message, we need rain! The hot, windy weather has depleted much of the topsoil moisture and stress is beginning to show up in pastures and ranges. Topsoil moisture supplies were rated 59 percent short, up 13 percent from a week earlier.

The dry weather did allow farmers to make excellent progress planting spring crops. Spring wheat, barley, sugarbeets and oats were 73 to 86 percent seeded. Planting of other crops were as follows: Potatoes, 21 percent; corn, 70 percent and dry beans, 50 percent.

The condition of Montana's winter wheat crop was still rated 74 percent good, but had deteriorated from a week earlier. Grasshoppers were hatching in large numbers, expecially in the eastern third of the State and some hopper damage was already reported.

The livestock situation shows about 46 percent of the cattle, calves, sheep and lambs had moved to summer range. Movement this year is ahead of normal for this date. There is concern about this year's hay crop and reduced range grass because of shortages of irrigation water and little rain. Maybe it's time for a rain dance folks!

FARMLAND A VITAL RESOURCE

Farms are an important part of the nation's ecosystem. That fits in with the emphasis on the "Take Pride in America" campaign, which stresses responsibility for both public and private land.

Many of the nation's natural resources are either owned or influenced by farmers. Use of these lands influences the appearance of our rural landscape, the quality of our water and air, as well as the type and amount of wildlife.

Farmers have become more aware of the wisdom of land stewardship. Soils sustain the crops, livestock, and trees upon which a healthy agricultural economy depends. Careless management may lead to excessive erosion, water pollution, and other problems that generations of work may not be able to repair. The "Take Pride" campaign emphasizes protection of agricultural land as one of this country's most vital resources.

FARMLAND VALUES

FIELDWORK MADE GOOD PROGRESS

Late April's warm weather helped farmers make good progress tilling fields and seeding crops. Most spring seeding was close to 40 percent done at the end of last week. This is slightly behind average and quite a bit behind last year. Although soil moisture is adequate in most locations, about 20 percent of the state is reporting short topsoil moisture. Also, every location reported below normal precipitation April 1-25.

Calving and lambing are in final stages and both cattle and sheep death losses have been below normal this year.

SHEEP & LAMB LOSSES

Montana sheepmen lost 132,000 sheep and lambs in 1986 to weather, predators, disease and other causes - up 4 percent from 1985. The value of the loss was up 8 percent at $6.4 million. Predators were responsible for $2.1 million, non-predator factors caused $3.4 million, and unknown causes claimed $.9 million.

Coyote predation continued to be the single most important cause of death. They accounted for 23 percent of the total lost value.

Total predator caused losses in the lamb crop were down 15 percent from last year. Sheep lost to predators were down 32 percent.

Lambs lost to weather, disease and other non-predator causes were up 17 percent from last year. Sheep losses to non-predator factors were up 26 percent.

Lambs and sheep lost to unknown causes were up 15 percent.

POTATO STOCKS

Montana potato stocks on hand April 1, 1987, totaled 1.35 million cwt, up 23 percent from a year ago.

April 1, 1987, potato stocks totaled 91.7 million cwt in the 15 fall storage states. This is down 12 percent from a year ago, but 5 percent above 2 years ago.

Stocks in the six western states totaled 69.8 million cwt, down 1 percent from last year, but 14 percent above two years ago. Idaho stocks of 38.0 million cwt are 9 percent above last year and Montana (mainly seed) stocks of 1.35 million cwt are up 23 percent. The other four western states have fewer potatoes on hand than a year ago. Washington stocks of 14.6 million cwt are 10 percent below last year and Oregon's 7.8 million cwt of stocks are down 2 percent. Colorado at 6.3 million cwt is down 17 percent and California stocks of 1.7 million cwt are off 35 percent.

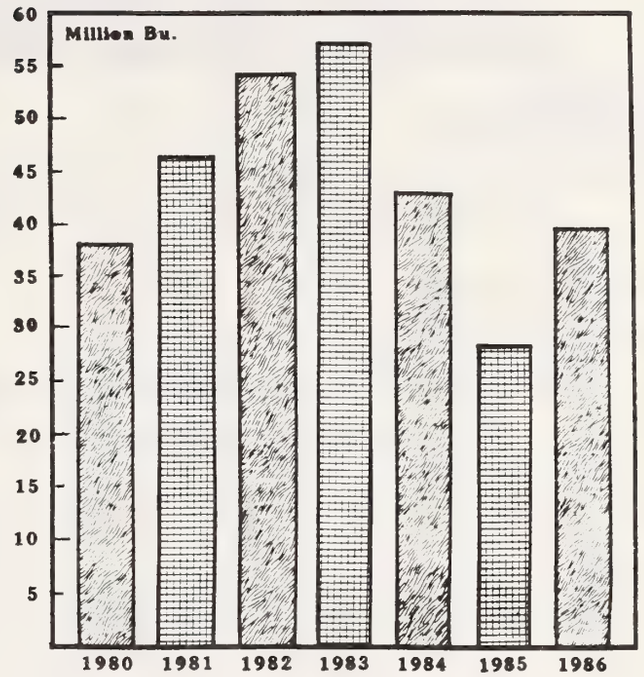
6 months June - November



EGG RECEIPTS UP

Montana 1986 egg production was valued at $9.4 million, 9 percent above last year in spite of a 1 percent decrease in egg production. The average price was 56 cents per dozen, 5 cents more than the previous year.

Chickens sold in 1986, excluding broilers, brought producers $189,000. The average price received, mostly for spent laying hens, was 8 cents per pound.

Nationally, value of egg production was $3.52 billion in 1986, up 8 percent from 1985. Egg prices averaged 61.6 cents per dozen in 1986, compared with 57.1 cents in 1985.

MILK PRODUCTION

Montana dairymen produced 76 million pounds of milk during the first quarter of 1987. The production was 10 percent less than the January-March period of 1986 and reflected a decline in the number of milk cows in Montana. Milk cow numbers fell from 28,000 head in 1986 to 24,000 head in January-March 1987. Largely due to the nation-wide dairy buy-out program.

Grain and other concentrates fed to milk cows on April 1 averaged 15.0 pounds per head, up slightly from last year. The price of these concentrates fell an average of 60 cents per hundredweight to $6.00 per hundredweight.

Nationally, the quarterly production of milk for the U.S. was 34.9 billion pounds, 4 percent below January-March 1986.

The average number of cows in the U.S. during the January-March quarter was 10.5 million head, 6 percent below January-March 1986, and 1 percent below October-December 1986.

SURVEY RESULTS

1987 PLANTING INTENTIONS

The March 1st acreage intentions report held some interesting news for Montana farmers. Acreage to be planted to all major crops plus hay acreage for harvest totaled 9,528 thousand acres, down 469 thousand acres or 5 percent from 1986.

WHEAT ACREAGE CUT 5 PERCENT

Wheat acreage is expected to total 4,770 thousand acres in 1987, down 5 percent from 1986 and the smallest acreage since 1973. Nationally, wheat acreage is forecast at 64.8 million acres down 10 percent from 1986 and the fewest acres in 14 years.

BARLEY ACREAGE OFF SHARPLY

Montana farmers intend to plant 2,300 thousand acres of barley, 4 percent less than a year ago. U.S. barley acreage is expected to be down a whopping 15 percent, with North Dakota, the largest producing state, off a sharp 17 percent.

The data for the March Intentions Survey was collected by phone from about 1600 Montana farmers between March 1st and 13th. Farmers that had bids pending in the most recent sign-up of the Conservation Reserve Program (CRP) were to answer assuming their bids would be accepted. Oat acreage was higher both statewide and nationally. Much of this crop may never be harvested because oats is commonly used as a cover crop for land placed in conservation programs.

Another reason planting intentions are down in Montana is because participation in this year's farm program requires a set-aside of 20 percent and 95 percent of producers are expected to sign up.

FIGURES COULD CHANGE

Remember, this survey covers intentions for all spring planted crops and these plans could change! Factors such as farm prices, costs and, of course, the weather could result in somewhat different figures when we see the next acreage report in early July.

MONTANA PLANTED ACRES

WOOL PRODUCTION DOWN, VALUE UP

Montana wool growers produced 5.2 million pounds of wool in 1986, 6 percent less than the previous year. Value of this year's wool clip increased, despite smaller production, as prices rose from 67 cents in 1985 to 74 cents per pound in 1986. Montana's 1986 wool clip value was $3.9 million.

Montana's rank among all wool producing states is 5th, in terms of total wool production. However, Montana growers produced the second heaviest average fleece weight, outranked only by Alaska. The average fleece weight for all U.S. producers was 7.81 pounds, while Montana averaged 10.5 pounds and Alaska was 10.6 pounds per fleece.

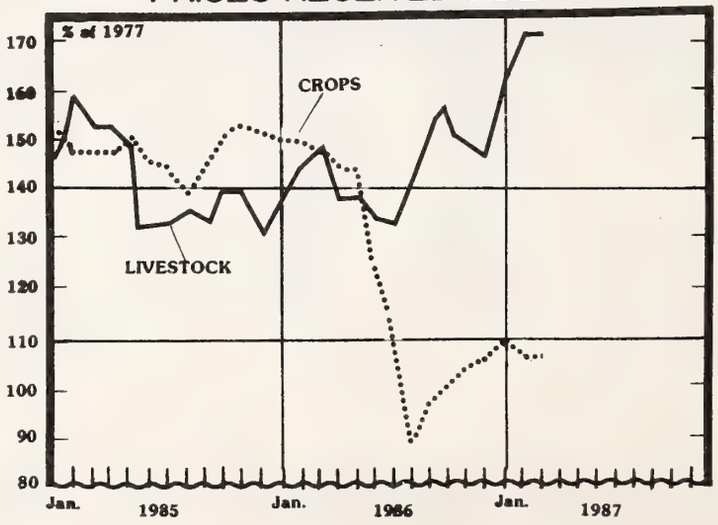
MONTANA DAIRY PRODUCTS

Montana dairy plants produced 113,000 gallons of ice cream in February, 22 percent less than the same month a year ago. Creamed cottage cheese production at 268,000 pounds was also down 22 percent from 1986. Butter churned was down 24 percent from last year at 138,000 pounds. American cheese production at 248,000 pounds was down 22 percent from the previous year.

MONTANA CROP & LIVESTOCK PRICES RECEIVED INDEXES



FIELDWORK GETTING STARTED

This year's first weekly crop-weather report shows field work is just getting started in Montana with very little seeding so far. This report is a cooperative venture between the Agricultural Extension Service, National Weather Service and Montana Agricultural Statistics Service. Crop-weather reports are issued every Monday throughout the growing season.

This week's report says both topsoil and subsoil moisture supplies are adequate to surplus with very few areas showing shortages. This reflects the good carryover moisture we had from last fall and the recent spring snowstorms.

The condition of our winter wheat crop continues to improve with warm days and is now rated mostly good. Most of the crop is greening up with about 20 percent still dormant.

A look at the livestock situation shows calving is now about 60 percent complete while lambing is about half done. Both are about average for this date.

Temperatures were normal to above normal last week with very little precipitation.

WHEAT STOCKS ABOVE A YEAR AGO

Montana's All Wheat Stocks on March 1, 1987, totaled 121.3 million bushels, 40 percent more than April 1, 1986. Wheat stored on farms at 85 million bushels was up 63 percent from last year, while wheat stored off farms at 36.3 million was up 5 percent.

Disappearance from December 1, 1986, totaled 41.6 million bushels, a reduction in total stocks of 26 percent.

Winter wheat stocks in all positions totaled 63.6 million bushels, hard spring wheat was 51.3 million, and durum was 6.4 million.

Nationally, all wheat stored in all positions on March 1, 1987, is estimated at 2.25 billion bushels, up 6 percent from April 1, 1986. Off-farm stocks are placed at 1.46 billion bushels. On-farm storage accounts for 796 million bushels. Indicated disappearance from all storage positions during the December 1986 February 1987 quarter is 418 million bushels.

US EXPORT UPDATE

During the last 5 marketing years the following percentage of production of these crops was exported: wheat (54), rice (49), cotton (47), soybeans (40), corn (26). These crops produced primarily in the Corn Belt, Delta, Northern Plains, and Southern Plains, remain heavily dependent upon exports.

However, the export value of wheat, rice, feed grains, oilseeds and products, and cotton declined 25 percent in the first 11 months of the 1986 fiscal year. The value of agricultural exports fell 17 percent overall in this period, while export volume declined 15 percent.

With recent changes in exchange rates there are indications that U.S. agricultural exports in 1987 will begin to stabilize for commodities such as soybeans, wheat, and rice, while increasing in cotton. The longer-run export outlook is clouded because of the uneven changes in the U.S. dollar against currencies of both importers and exporters of grains, oilseeds, and cotton, and the 1-3 year lag between currency devaluation and resultant changes in trade patterns. Also affecting exports will be the continued presence of both tariff and nontariff barriers to major U.S. agricultural commodities, targeted Export Assistance Agreements, and supply/demand factors ranging from global weather patterns to changes in meat production levels in centrally planned economies.

In compensation for lower U.S. feed grain exports because of Spain's and Portugal's entry into the Common Market, the European Community (EC) has agreed that Spain will import 2 million metric tons of corn and 300,000 tons of sorghum annually from outside the EC. If imports do not reach this level by reducing tariffs, the grain will be imported directly by EC intervention agencies.

Under the 4-year agreement, the United States will share this quota with other exporters. Tariffs on 26 other agricultural products and industrial goods were also reduced, and the EC lifted a requirement that 15 percent of Portugal's grain imports come from the rest of the EC.

The agreement brought the United States and the EC back from the brink of another trade confrontation because of the lost feed grain exports.

STATE DOCUMENTS COLLECTION

THANKS TO REPORTERS!

At one time or another most of us have been asked to provide survey information--sometimes by mail, othertimes by phone or personal interview. Surveys are used to sample public opinion or to gather measurable factual information. Why are there so many surveys these days? And why are survey results so important? Simply put, surveys help people make better decisions. Surveys provide information that helps us make fewer mistakes! Those with the best information usually make the best decisions.

The Montana Agricultural Statistics Service does surveys about agriculture. We survey producers and agriculture businesses to help farmers and ranchers make informed decisions about production and marketing. Participation in surveys in the U.S. is voluntary, yet 85 to 95 percent of those contacted participate!

In turn, those who participate in Montana Agricultural surveys receive results free of charge. But, too often, we don't take time to say, "Thanks" to those who contribute -- your help is appreciated!

MONTANA POTATO STOCKS UP

Montana potato stocks on hand March 1, 1987, totaled 1.97 million cwt, up 52 percent from a year ago.

Potato stocks in the 15 fall storage states totaled 125 million cwt on March 1, 1987. This is down 10 percent from last year, but 5 percent above two years ago. March 1 stocks represent 41 percent of fall production in the 15 states compared with 40 percent last year. Holdings are below last year in all states except Idaho and Montana.

The six western states storages held 90.5 million cwt of potatoes on March 1 this year, within 1 percent of last year's stocks and 15 percent more than two years ago. March 1 stocks in Idaho are 3 percent above last year. The Montana stocks are well above a year ago. Washington stocks are down 3 percent and Oregon holdings are down 4 percent. Colorado potato stocks are down 12 percent from last year and California is off 28 percent.

MONTANA EGG PRODUCTION

Montana poultry farms produced 51 million eggs in the December, 1986, through February, 1987, quarter. This is 4 percent more than in the same quarter last year.

The average number of layers in Montana poultry flocks was up nearly 1 percent from the previous year at 795,000.

The nation's laying flock was up 1 percent from the previous year and egg production was also up 1 percent.

U.S. NET FARM INCOME

Net farm income for 1986 likely ranged between $28 and $32 billion, in line with the final 1985 figure of $30.5 billion. A small increase to $29 to $34 billion is expected in 1987, because lower production expenses and larger direct Government payments will outweigh further declines in cash receipts. In 1987, production expenses are expected to drop over $1 billion to $124 billion, and Government payments could rise $3 billion to $16 billion.

SMALL BUSINESSES ARE BIG CONTRIBUTORS TO RURAL STABILITY

Small businesses have contributed both jobs and stability in the rural nonfarm sector. According to a recent USDA report,*

1. between 1976-80, 31% of the net increase in private nonfarm jobs in nonmetro areas were created by small businesses (independent firms with less than 100 employees);

2. while it was true that some small businesses in operation less than 5 years had very high turnover rates, these new businesses nonetheless accounted for over 40% of the net increase in private non-farm jobs in both nonmetro and metro areas between 1976-80.

3. small businesses in nonmetro areas accounted for 31% of the 1976-80 increase in new jobs versus 40% in the metro areas. It's expected that small businesses could "incubate" better in metro than nonmetro areas because of the larger market and better availability of services and goods.

According to the report, local planners should look at both advantages and disadvantages of both small businesses and large corporations when mapping out economic development strategies.

Large corporations may be able to create many new jobs in a single stroke. Yet the shutdown of a large branch plant can devastate a small rural community.

Creating new and small local businesses can help rural communities expand employment, even though their failure rate is somewhat higher than for established businesses.

By encouraging small business startups, rural communities can diversify their local industrial base and reduce their vulnerability.

---

*"Recent Contributions of Small Businesses and Corporations to Rural Job Creation," James Miller, Economics Research Service, USDA.

PRODUCTIVITY IN US AGRICULTURE

We often hear about the tremendous productivity of U.S. agriculture -- what does this mean? Productivity is defined by economists as increased output per unit of input. More efficient use of resources such as fertilizer, feed and improved plant and animal breeding contribute to higher productivity. Feed conversion in animals and plant yields are measures of productive gains that have been characteristic of U.S. agriculture.

Productivity gains averaged 2 percent a year from 1948 to 1984, but during the past few years growth has increased to over 5 percent per year.

With relatively low farm prices, the need to reduce production costs becomes very important. In fact, it may mean the difference between staying in business and going broke!

So the pressure is on to continue to increase productivity to cut production costs. So look for U.S. farm productivity to grow at an average rate of 2-4 percent over the next few years.

MONTANA CASH RECEIPTS UP

Preliminary cash receipts data indicate Montana farmers and ranchers took in 2 percent more from the sale of commodities in 1986 compared with 1985.

Livestock receipts were up nearly 2 percent, and crop receipts were nearly 3 percent higher than the previous year.

CASH RECEIPTS - MONTANA

ITEM	1984	1985	1986 1/
	---Million dollars---		
Livestock	717	802	817
Crops	649	405	417
Total from Marketings 2/	1366	1207	1234

1/ Preliminary. 2/ Excludes government payments.

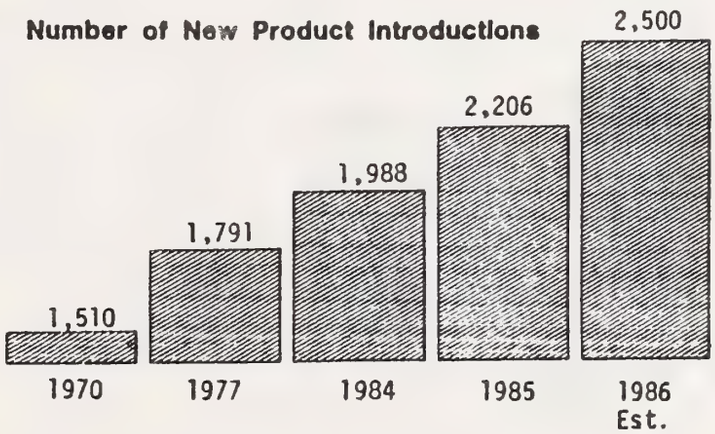
FOOD PROCESSING ADDS VALUE

The food system continues to be the largest marketing system in the U.S. economy, accounting for about one-tenth of U.S. employment and gross national product (GNP). The system's contribution to the GNP last year was almost 9 times the value of the U.S. farm system's food-related contribution.

USDA estimates that last year, the food marketing system bought $85 billion in U.S. ag commodities, $15 billion in foreign ag commodities, and $8 billion in seafood products.

The food processing industry added an estimated $70 billion to the value of this raw food supply; wholesaling, retailing, and transportation combined added over $135 billion; and eating and drinking places added $60 billion.

The estimated number of new products introduced by the food marketing system last year totaled 2,500 versus 2,206 in 1985.



FEBRUARY LIVESTOCK SLAUGHTER

Montana slaughter plants produced 1.3 million pounds of red meat in February, 1987, 10 percent less than in January and 1 percent less than a year ago.

Cattle slaughter at 1600 was 6 percent less than a year ago. Total liveweight, however, was off only 2 percent as average liveweight increased 61 pounds per head.

Hog slaughter at 1900 was down 5 percent from last year.

Commercial red meat production for the United States in February, 1987, totaled 2.88 billion pounds, down 2 percent from February 1986.

The percentage changes from 1986 accumulated production by individual components were: Beef, down 2; Veal, down 13; Pork, down 2; Lamb and Mutton, down 16.

COMMODITY PROGRAMS TAKE 40% OF USDA BUDGET

This year's USDA budget is $53.14 billion. A breakdown on where those funds go is shown on the chart below.

Commodity programs account for 40% of this year's budget. Out of every $3 in the budget, over $1 will go for food and consumer services, mostly in the form of food stamps.

At this level, for every $1 spent on the USDA budget, about $6 is spent on defense (military and civilian).

FINANCIAL STRESS IN US AGRICULTURE

Financial stress in U.S. agriculture has been widespread during some parts of every decade since World War I. The Great Depression began for agriculture in 1920 and continued until World War II. During the late 1940's, the 1950's, and the 1960's, two-price programs, acreage allotments, marketing quotas, and the Soil Bank were used in various times to help improve life on the farm while disposing of surpluses and limiting Government outlays. Even the boom in exports in the early 1970's provided only temporary respite. By 1978, before the current slide in asset values began, some farmers were protesting Government policies by blockading Washington streets with tractors. Thus the financial stress in agriculture during the 1980's, while severe, continues a decades-old trend.

LARGE-SCALE FARMS IN PERSPECTIVE

The number of large-scale farms (farms with annual sales of $500,000 or more) increased from 11,400 in 1974 to 27,800 in 1982. Although only 1.2 percent of all U.S. farms, these farms controlled over 10 percent of the land in farms in 1982 and accounted for nearly 33 percent of the total value of farm production. Adjusted for the effects of price inflation between 1974 and 1982, the number of large farms by sales class still rises, but by 5,286 less than the increase of 16,388 in the unadjusted number.

Large-scale farms have a higher than average value of output per acre and per dollar of investment. The largest farms are predominantly cattle feedlots, poultry operations, and vegetable farms. The smaller large-scale farms are mostly cattle ranches, cash-grain farms, and dairy farms.

The majority of large-scale farm operators are partowners. But 40 percent of the owners operate as sole proprietors and 37 percent as corporations (mostly family corporations). Less than 33 percent of large-scale farms with sales below $1 million operate as corporations. For farms with sales between $1 million -$4,999,999, about 50 percent operate as corporations, and nearly 80 percent of those with sales of $5 million or more are corporations.

Any discussion of how large-scale farms will fare relative to smaller farms is at best conjectural. However, indications are that these farms will continue to be an increasingly important segment of U.S. agriculture. Two recent studies concluded that a bimodal distribution of farms is emerging, with a large proportion of small farms, an increasing proportion of large farms, and a declining proportion of medium-sized farms. Neither study, however, suggests that medium-sized farms will disappear.

The strongest evidence for the continued growth of large-scale farms is their ability to withstand economic adversity. Average net farm income of large-scale farms fell 36 percent between the peak farm income year of 1973 and 1984, much less than all other sales classes except farms with gross sales of $100,000-$499,999.

Ability to control production costs is a major factor contributing to large-scale farms' ability to maintain net income levels. While the average large-scale farm recorded a slight decrease in production costs between 1973-84, all other sales classes recorded substantial increases in per farm costs of production. Consequently, large-scale farms may come through periods of economic adversity, such as the 1982-86 farm debt crisis, in a much stronger financial condition than small full-time commercial farms.

Another indicator that points to continued growth of large-scale farms is their rate of technological innovation. Large-scale farms tend to operate at the forefront of technology and are usually the first to adopt new production and managerial techniques. This is a major reason that they have been able to contain costs of production more effectively than have smaller farms. For these reasons, large-scale farms will continue to increase their numbers and share of total production.

Large-scale farms:

Number of farms, land in farms, and value of sales

Value of sales	do.	22.5	27.3	32.4

WHY GASOHOL CAN'T PASS THE FARM INCOME COST-BENEFIT TEST

Boosting farm income by subsidizing the production of fuel ethanol from grain is beginning to make less and less economic sense as energy prices remain depressed.

That's the view of researchers at USDA's Office of Energy in a recent report, "Fuel Ethanol and Agriculture: An Economic Assessment."

"Subsidized ethanol production is a very inefficient way to raise farm income," says USDA economist Gerald Grinnell, one of the researchers. "It would be much more economical to burn straight gasoline in our automobiles and pay farmers a direct subsidy equal to the amount they would receive as a result of ethanol production."

If these conclusions are correct--and not everyone agrees with them--it could mean bad news for the U.S. ethanol industry.

The industry, which was built with the government's financial support, was expected to help protect the United States from the threat of future oil embargoes and spiraling oil prices. Although such threats could arise again in the future, they no longer seem nearly as urgent.

It's that apparent lack of urgency on the energy issue that raises another question: Is continued government support for the industry justified because of ethanol's importance to agriculture?

The Office of Energy study indicates that the ethanol industry cannot survive without massive government subsidies--given the current outlook for petroleum prices. And federal subsidies are scheduled to expire at the end of 1992.

Moreover, even these subsidies (which now amount to 60 cents per gallon of fuel ethanol) are not sufficient for most existing ethanol plants to continue operating, according to Grinnell. "The majority of ethanol producers will need larger subsidies to stay in business, unless oil price increases make fuel ethanol more competitive," he says.

Here's how the federal subsidy works: The federal excise tax on gasoline is now 9 cents per gallon. To encourage development of a domestic fuel ethanol industry, the federal government reduced the tax on fuel ethanol-gasoline blends, also known as gasohol.

Gasohol blends of one part ethyl alcohol (ethanol) and nine parts gasoline are eligible for a 6-cents-per-gallon exemption from the federal excise tax. Since 1 gallon of ethanol makes 10 gallons of gasohol after blending with gasoline, that translates into an exemption of 60 cents for each gallon of ethanol.

In addition, many states have enacted laws to encourage ethanol production and its use by motorists. More than half of all states offer incentives, usually in the form of exemptions from the state excise tax or sales tax on motor fuels. State subsidies vary, ranging from 10 cents to $1.40 per gallon of ethanol. Some states offer subsidies only for fuel ethanol produced in that state, others for all domestically produced fuel ethanol, and still others for all fuel ethanol, both imported and domestic.

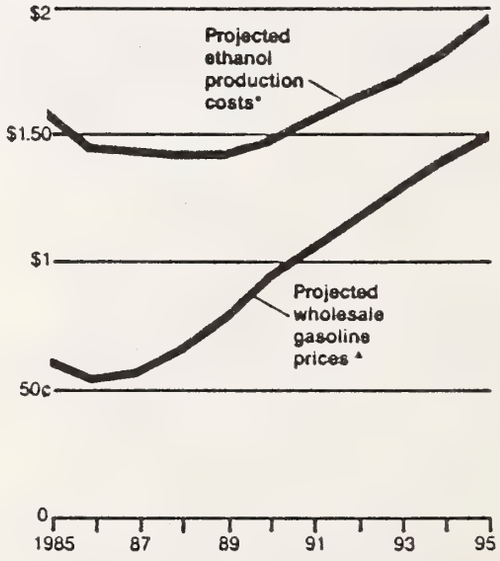
Assisted by such subsidies, the industry produced around 625 million gallons of ethanol in 1985 by converting about 250 million bushels of corn and other feedstocks.

"The fuel ethanol industry grew from near nothing in 1978 to become an imnportant component of the gasoline market," says Grinnell. "The 625 million gallons of fuel ethanol were blended with 5.6 billion gallons of gasoline in 1985."

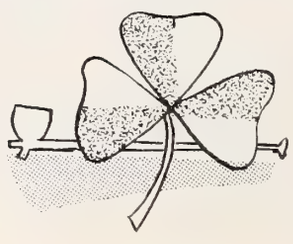
Since most U.S. ethanol is produced from corn, corn producers have come to view ethanol as a significant market for their crop.

"Many people believe that increased ethanol production can help solve the problem of overproduction and low prices in agriculture and reduce the costs of government commodity programs," says Grinnell. "However, the ethanol industry, like agriculture, is heavily dependent on government subsidies. As a result, increased ethanol production could simply shift subsidy payments from agriculture to ethanol interests as more outlays for ethanol subsidies offset lower commodity program costs."

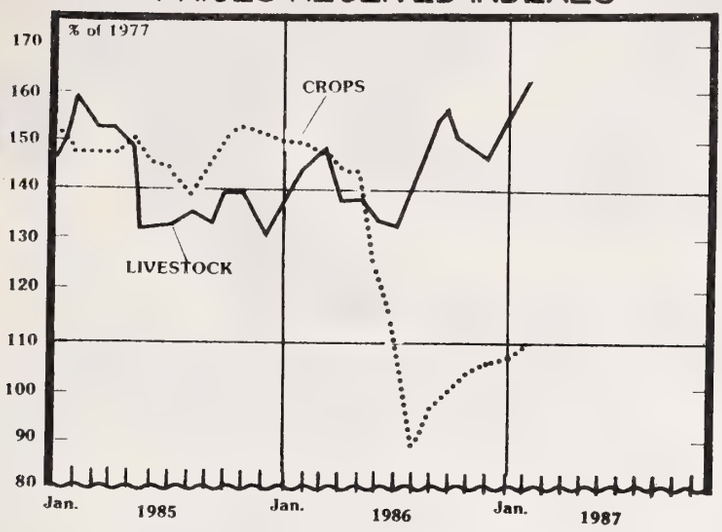
Projections Suggest Ethanol Production Costs Will Continue To Exceed Wholesale Gasoline Prices



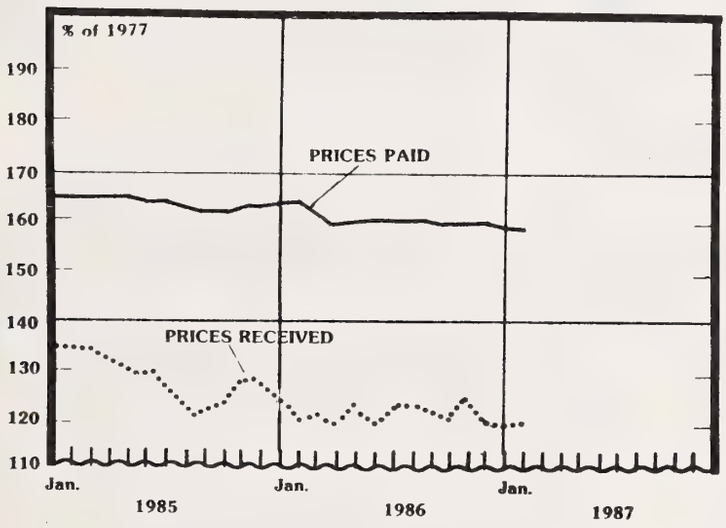
*Estimates assume ethanol production grows to 1 billion gallons annually by 1995 and existing federal subsidies are extended or increased. ▲ U.S. Department of Energy "base case" scenario.



MONTANA CROP & LIVESTOCK PRICES RECEIVED INDEXES



UNITED STATES INDEX NUMBERS OF PRICES PAID & PRICES RECEIVED



SURVEY RESULTS

MONTANA LIVESTOCK PRODUCTS STRENGTHEN--CROPS WEAKER

Montana farm prices increased during February for most livestock items while crop prices were mostly down.

The February Index of Prices Received by Montana Farmers for All Farm Products was 142 percent of the 1977 base -- up 5 points from January, but 4 points below a year ago. The All Crops Index at 109 was down 1 point from January and 41 points below February 1986. The All Livestock and Products Index at 171 was up 9 points from last month, and 27 points above a year ago.

Nationally, the February All Farm Products Index of Prices Received by Farmers, at 121 percent of its January-December 1977 average, was unchanged from the previous month. Compared to a year earlier, the Index was down 1 point (0.8 percent). Higher prices for cattle, hogs, oranges, and sweet corn were offset by lower prices for lettuce, corn, cotton, and milk.

Cattle and hog prices were higher, but prices for most other items in the Livestock and Products Index were below the previous month. Field crop prices generally declined from a month earlier. Compared to a year earlier, only oats, dry edible beans, and potato prices were higher.

SURVEY RESULTS

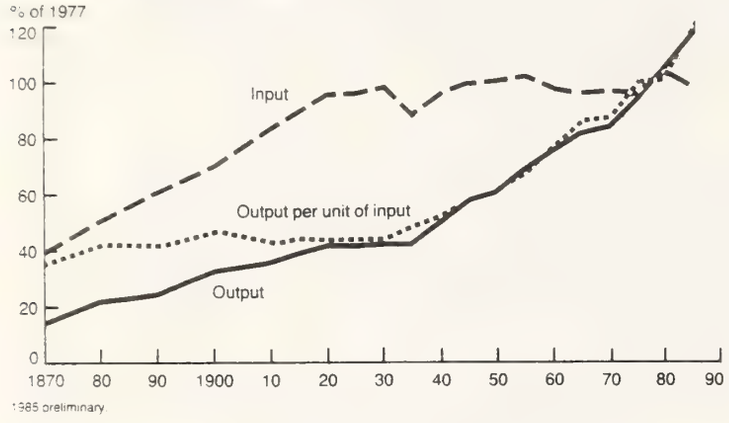
MONTANA DAIRY PRODUCTS

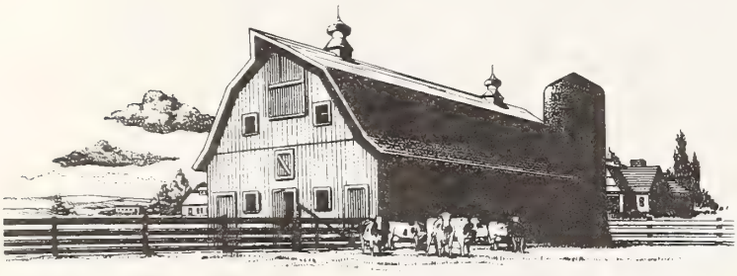
Montana dairy plants produced 86,000 gallons of ice cream during January -- 41 percent less than in January 1986. Creamed cottage cheese production at 288,000 pounds was 16 percent less than a year earlier. Butter output at 192,000 pounds was up 6 percent. American cheese production at 200,000 pounds was down 37 percent from the same month a year ago.

CHANGES FROM FARM TO RETAIL

Changes in agriculture boosted productivity. Output per unit of input rose 243 percent between 1870 and 1985, much of it during the past 30 years. These increases resulted from many factors, including the expansion of the Nation's agriculture into the more productive lands of the Midwest, shifts among crops, and improvements in farm management, pest, control, and cropping techniques. Applied genetics alone has probably accounted for as much as 50 percent of harvest increases since the 1930's.

Greater Farm Productivity Means More Output From Inputs





CAT SCANNING FARM ANIMALS

A sophisticated tool used in human medicine may help select livestock of the future with just the right amount of fat for consumers.

Kreg A. Leymaster, an animal geneticist with the USDA Agricultural Research Service in Nebraska, believes the CAT (computer-assisted tomography) scan may be just the tool for livestock scientists.

Preliminary results from experiments Leymaster helped conduct at the Agricultural University of Norway "are quite encouraging," Leymaster says.

CAT scanners are commonly used in medicine as a diagnostic tool. The cross-sectional images, constructed from X-ray data, may provide animal researchers a way to assess the amount of lean meat without slaughtering the animal.

Leymaster says, "After seeing inside the living animals in this way, researchers can save for breeding those animals judged as genetically superior."

The goal is to produce meat that is lean as well as tender and tasty. --By Ben Hardin, ARS.

DEBT TO ASSETS DOWN

SURVEY RESULTS

Results of the 1986 survey peg the 1986 Debt to Asset Ratio at 23.4 percent --down from 27.8 percent reported a year ago. The Debt to Asset Ratio is a standard measure of economic health used in financial analysis. It means the average farm debt in Montana was 23.4 percent of average farm assets.

Total assets averaged $655,786 per farm or ranch, up 5 percent from 1985. Increased grain production and stocks along with higher livestock values helped stabilize assets, off-setting a futher decline in real estate values. Debt per operation at $153,171 was down 12 percent from 1985. There were a number of comments on this year's survey indicating that government program payments made late in 1986 were used by many to bring delinquent loans up to date and to pay off debt.

A review of Debt to Asset Ratios by Crop Reporting District shows conditions have improved in north central, central, eastern, and southwestern areas while conditions have deteriorated somewhat in the northwest and south central districts. Ratios in all areas were less volatile and none reached the 30 percent and over level that we saw in 4 districts a year ago.

	1985 (561 Reports)	1986 (551 Reports)
Assets	623,844	655,786
Debt	173,563	153,171
Ratio	27.8%	23.4%

FARM FINANCES IMPROVE in '86

Montana's 1986 agricultural production showed tremendous improvement over the drouth plagued 1985 season. All Wheat production was nearly three times larger than the '85 crop, while barley hit a new production high. Crop prices, however, were down sharply from '85 levels. Cattle inventories were down again according to the January 1, 1987, count, but the decline is leveling off and prices were up from a year ago. Both hog and sheep industries are expanding as prices and profitability have improved.

Farm income figures for 1985 showed an average 15 thousand dollar loss for each farm or ranch in Montana. Government program payments averaged 9 thousand dollars per farm in 1985. This kept losses from going even higher.

Montana's agriculture usually accounts for nearly one-third of the state's gross income. The severe reduction in farm income has contributed heavily to the state's economic problems. Results of this year's survey provide some optimism that conditions are not as dismal as they were a year ago.

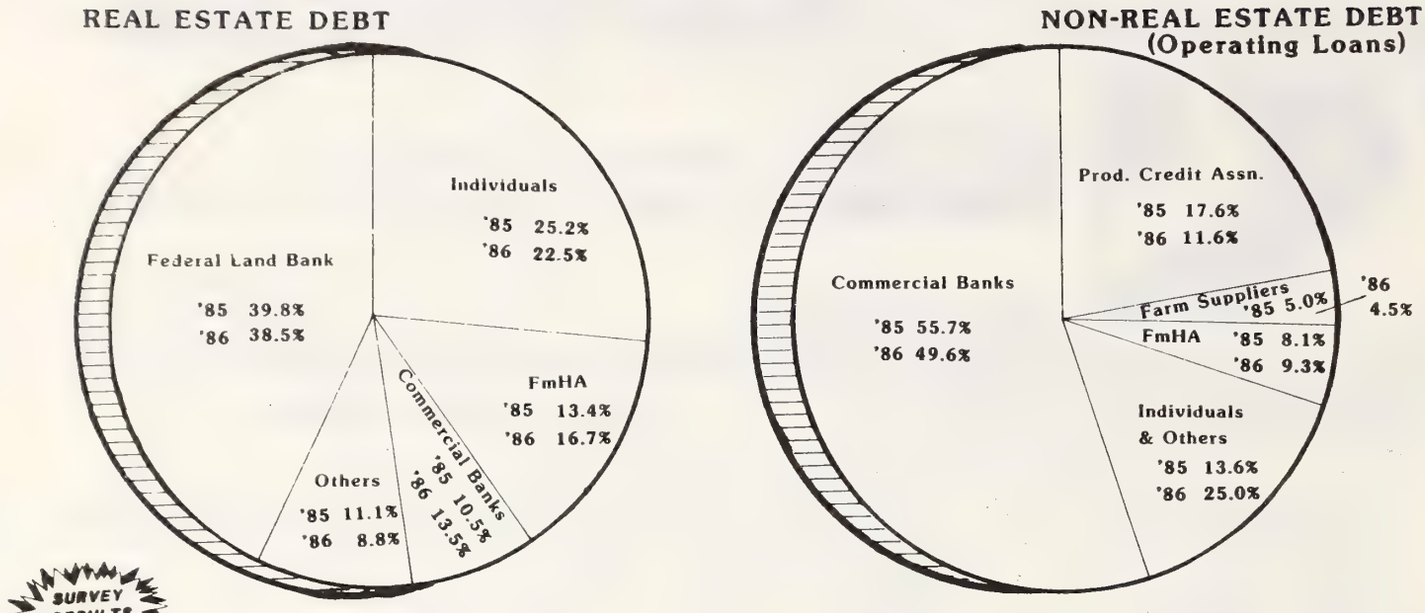
MONTANA FARM DEBT BY LENDER 1985 & 1986



SURVEY RESULTS

DELINQUENCY RATES DOWN

The delinquency rate on both real estate and operating loans is down from a year ago. Real estate delinquencies declined from 24.1 percent in 1985 to 18.4 percent in 1986. Operating loan delinquencies dropped sharply from 32.7 percent to 14.2 percent.

Livestock producers had the lowest delinquency rate on real estate at 11.1 percent, while Cash Grain producers were at 15.1 percent. Cash Grain producers had the lowest operating loan delinquencies at 13.7 percent while livestock producers tabbed 14 percent. The Mostly Livestock farm class had the highest delinquency rates for both real estate (29.6 percent) and operating loans (17.7 percent).

A look at loan applications shows 13.9 percent were turned down compared with 15.6 percent a year ago. Fifty percent of these were able to find credit elsewhere -- up from 47 percent a year ago.

LOAN DELINQUENCY RATE BY SIZE OF FARM

SIZE OF FARM	REAL ESTATE LOANS DELINQUENT		NON-REAL ESTATE LOANS DELINQUENT	
	1985	1986	1985	1986
-Acres-	--------Percent--------			
499 or Less	21.5	40.0*	36.7	19.0
500-999	39.3	10.0	34.5	10.3
1,000-1,999	25.3	15.6	41.9	17.0
2,000-2,999	29.5	13.0	39.0	25.5
3,000-4,999	18.9	16.5	19.6	7.2
5,000-9,999	19.5	11.5	19.0	7.3
10,000 +	18.5	17.9	28.2	6.5
STATE TOTAL	24.1	18.4	32.7	14.2

* Fewer in this group had real estate loans, but those with loans had a high delinquency rate.

OTHER FACTS AND FIGURES

--Real estate delinquencies at 22.6 percent were highest in the 35-44 age category, lowest at 5.6 percent were found in the 65+ age group.

--Operating loan delinquencies were highest in the 25-34 age group, averaging 19.7 percent, lowest at 10 percent were the over 55 group.

--Twenty percent of total income was earned off of the farm. Percents ranged from 43 percent for those under 500 acres to 4 percent for the 10,000+ acre group.

--Average real estate interest rate was 9.5 percent, while operating loan interest averaged 10.9 percent. This compares with 10.6 percent and 12.9 percent a year ago.

POTATO STOCKS

Montana potato stocks on hand February 1, 1987, totaled 2.04 million CWT, up 51 percent from a year ago.

Fall potato stocks in the 15 major storage states totaled 151 million CWT on February 1, 1987. This is down 12 percent from last year but 4 percent above two years ago. Stocks accounted for 50 percent of 1986 fall production, the same percentage as a year earlier. By type, potatoes are 81 percent russet, 16 percent white, and 3 percent red.

The 6 western states stored 106 million CWT of potatoes on February 1, 1987, down 5 percent from last year but 13 percent more than two years ago. Idaho stocks were down 4 percent from last year. Oregon and Washington stocks were down 5 percent. Colorado stored 21 percent fewer potatoes than a year ago and California stocks were off 31 percent.

JANUARY SLAUGHTER DOWN

SURVEY RESULTS

Montana slaughter plants produced 1.4 million pounds of red meat in January, down 16 percent from December 1986, and down 20 percent from January 1986.

Cattle slaughter was down about 500 head from last January - a reduction of 22 percent in terms of liveweight. Hog slaughter was down about 300 head as liveweight was down 16 percent.

Nationally, commercial red meat production for the United States in January 1987 totaled 3.41 billion pounds, down 2 percent from January 1986.

Comparing January 1987 with January 1986:

Beef production, at 2.10 billion pounds, was down 2 percent. Head kill totaled 3.20 million, down 4 percent. The average liveweight increased 9 pounds to 1109.

Veal production, at 39 million pounds, was down 15 percent. Calf slaughter totaled 263 thousand head, down 15 percent, and the average liveweight increased 1 pound to 250.

Pork production, at 1.24 billion pounds, was down 2 percent. Hog kill totaled 6.92 million head, down 4 percent. The average liveweight increased 4 pounds to 250.

Lamb and mutton production, at 25 million pounds, was down 19 percent. Slaughter totaled 428 thousand head, down 17 percent. The average liveweight was unchanged at 118 pounds.

Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

BEEF EXPORT PROSPECTS BRIGHTEN

Montana is a state blessed with abundant natural resources, but lacks value added industries. For example, over 80 percent of our grain is shipped out of state for milling into flour or for export. Most of our cattle is also sold to buyers in other states where they're fed and sold to out-of-state slaughter houses. But all is not doom and gloom! Some enterprising Montanans have been communicating with the Japanese to sell Montana beef in Japan. Prospects appear very good at this time according to Keith Kelly, Herb Townsend, and Craig Winterburn, who just returned from a promotion trip to Japan. The plan is to fatten Montana beef on a mostly barley ration and slaughter, cut, wrap, and freeze the beef according to exact Japanese specifications. This beef would fill a niche in the Japanese market that can't be filled by their beef growers.

The prospects are exciting as both jobs and a market for Montana beef and barley would be created.

State's Red Meat Output Down

JANUARY 1 CATTLE COUNT DOWN

Montana's cattle inventory declined 2 percent from January 1, 1986, to January 1, 1987, according to the annual survey of Montana's ranchers and farmers. Total Cattle and Calves on Hand at the beginning of 1987 was 2.4 million head. This is the third consecutive year cattle numbers have declined. This year's total is nearly 1 million below the record high 1974 inventory and the lowest since 1963.

Beef cows that have calved were down 3 percent, but beef replacement heifers were up 2 percent. Milk cow numbers were down 11 percent, reflecting the effects of the dairy herd buy-out program. Milk cow replacement heifers were down 30 percent. Other heifers weighing 500 pounds or more, were down 22 percent. Steers weighing 500 pounds or more were down 12 percent. Calves weighing less than 500 pounds were up 22 percent.

The 1986 calf crop was 1.38 million, down 6 percent from 1985.

All Cattle and Calves in the United States January 1, 1987, totaled 102 million, down 3 percent from the 105 million on January 1, 1986, and 7 percent below the 110 million two years ago. This continued the recent downward trend in cattle inventories begun four years ago and was the lowest number on hand since 1962.

The 1986 U.S. Calf Crop was estimated at 41.2 million, up slightly from 1985, but down 3 percent from 1984. The estimated calf crop is up 3 percent from the expected numbers published last July.

JANUARY FARM PRICES

The January All Farm Products Index of Prices Received by Montana farmers and ranchers increased 6 points from December 1986. The index at 133 percent of its January-December 1977 average was still 11 points below January last year.

The All Crops Index was up 1 point from the previous month while the Livestock and Livestock Products Index was up 8 points. Compared with last year, the 2 index figures show sharply different changes. The January Livestock Index is 16 points above January 1986 but the Crops Index is down 43 points. Individual commodities were mostly up from last month with hogs and eggs down. Hay, winter wheat and wool were unchanged.

The January All Farm Products Index of Prices Received by US Farmers decreased 2 points from December to 119 percent of its January-December 1977 average. Lower prices for hogs, cotton, eggs, and corn were partially offset by higher prices for cattle, tomatoes, and lettuce. The index was 5 points below a year ago.

The Index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes, and Farm Wage Rates for January was 159 percent of its 1977 average. The index increased 1 point from October but was down 2 points from a year earlier. Feeder cattle and fuel prices were up slightly for the quarter. The Feed Index was unchanged from October.

SHEEP NUMBERS UP

Montana sheep producers had 523,000 sheep and lambs in their January 1, 1987, inventory. This was 11 percent more than on hand a year ago. Value per head was also up pushing inventory value to $42.9 million, 47 percent above January 1, 1986.

Sheep and lambs on feed for the slaughter market were 23,000, unchanged from a year ago. Stock sheep and lambs were up 11 percent at 500,000.

Most of this increase was caused by an increase of 46,000 head of ewe lambs being kept for replacement ewes. Ewes 1 year old and older were unchanged from last year at 370,000.

The 1986 lamb crop was down 4 percent from 1985 at 450,000 lambs docked or branded.

Nationally, the all sheep and lamb inventory on January 1, 1987, totaled up 3 percent from the 9.98 million head a year earlier, and the first increase since 1982.

Stock sheep inventory increased to 8.82 million head on January 1, 1987, up 4 percent from the record low 8.49 million head on January 1, 1986.

The U.S. 1986 lamb crop of 7.35 million head decreased 1 percent from the 1985 lamb crop.

FARM COSTS and RETURNS SURVEY

A nationwide survey to determine 1986 farm costs and returns will be conducted in February and early March. Here, in Montana, field interviewers are gearing up to contact a sample of 405 of the state's farmers and ranchers for this information. The information collected in this survey will determine current production and buying trends of U.S. farmers and ranchers. Estimates of farm costs and production expenses are used to compute Montana net farm income, which is needed to better understand the economic position of farmers and ranchers. The financial data will provide a current, more detailed perspective of the debts, assets, cash flow and level of financial stress of farmers and ranchers throughout agriculture.

Survey results will be published in June 1987 and will show data for the nation and ten economic regions of the U.S. The survey results will be mailed free of charge to survey respondents.

HONEY PRODUCTION

Montana Honey Production for 1986 (for producers with five or more hives) amounted to 7.0 million pounds. The State's beekeepers had 110,000 producing colonies last year. Average yield per colony was 64 pounds. Stocks were 211,000 pounds or 3.0 percent of production. The price for the 1986 honey crop averaged 48 cents per pound.

Nationally, honey production for 1986 amounted to 200 million pounds. The number of colonies producing this amount was 3.21 million with an average yield per colony of 62.5 pounds. Stocks were 27.2 million pounds or 13.6 percent of production. Prices for the 1986 honey crop averaged 51.3 cents per pound.

3 0864 1006 7734 6

DECEMBER SLAUGHTER DOWN

Montana slaughter plants produced 1.7 million pounds of red meat in December, 10 percent more than in November but 2 percent less than in December 1985. Total red meat production in the state for all of 1986 at 22.5 million pounds is 22 percent below 1985.

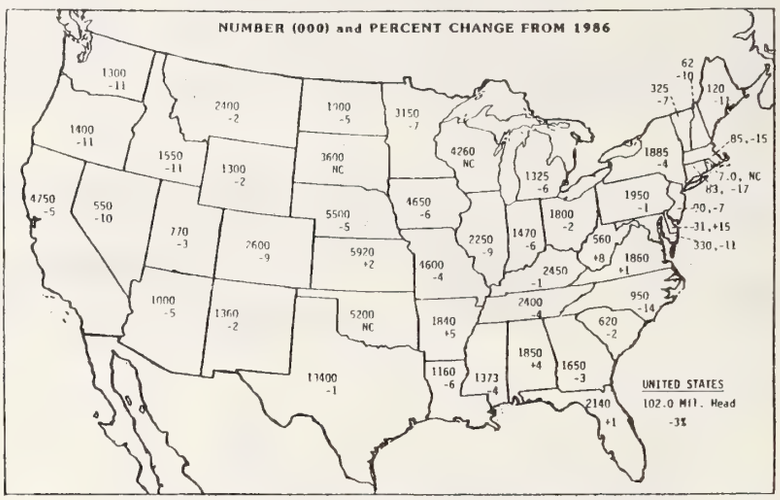
Cattle slaughter was down about 100 head from the previous December but red meat production was virtually unchanged due to increased slaughter weights. The average liveweight, at 1045 pounds, was up 42 pounds per head from 1985. Hog slaughter was virtually unchanged in terms of the number of head slaughtered, but again increased slaughter weights resulted in slightly higher red meat production.

Nationally, commercial red meat production in December 1986 totaled 3.26 billion pounds, up 4 percent from December 1985. January-December red meat production, at 39.0 billion pounds, was down fractionally from a year earlier. The percentage changes for 1986 accumulated production by individual components were: Beef, up 3; Veal, up 2; Pork, down 5; Lamb and Mutton, down 6. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

MONTANA DAIRY PRODUCTS

Montana dairy plants produced 139,000 gallons of ice cream during December -- 50 percent more than in December 1985. Butter output at 152,000 pounds was down 16 percent. Creamed cottage cheese production at 296,000 pounds was up 3 percent. American cheese production at 274,000 pounds was down 16 percent from the same month a year ago.

ALL CATTLE and CALVES JANUARY 1, 1987



CHICKEN NUMBERS REMAIN STABLE

Montana chicken numbers remained the same but total value increased during 1986. The December 1, 1986 inventory was 1.01 million birds the same as a year earlier. The inventory included 790,000 hens and pullets of laying age. The total inventory value of all chickens increased 11 percent to $2,020,000. The average value per bird at $2.00 was 20 cents more than the previous year.

1986 MONTANA CROP SEASON IN REVIEW

Montana's 1986 crop season was very much improved from 1985's major drouth. Good soil moisture supplies got both fall planted winter wheat and spring sown grains off to a good start. Winter weather favored the winter wheat crop and rains during June and July pushed spring grain development.

The excellent growing weather overshadowed a major grasshopper infestation in small grains which developed during the early summer. Considerable acreage was sprayed, especially field borders, but many farmers couldn't keep up and abandonment of spring plantings was extensive. Aphid damage also occurred and especially affected late planted oats, barley and spring wheat.

Harvest was interrupted by an abnormally wet September. This caused severe flood damage along the Milk River Valley, with stacked hay suffering the most. The fact that frost held off until early October enabled some crop farmers to complete harvest but somewhat later than normal. It proved to be a banner year for sugar beets because of the extended growing season.

Sprouting of small grains, especially barley, was a problem the second year in a row. In spite of the major problems, yield of all crops returned to a more normal level and hay stocks were replenished.

WINTER WHEAT PLANTINGS DOWN

Montana farmers planted 1.85 million acres of winter wheat this past fall for harvest in 1987--down 14 percent from the previous year and the lowest winter wheat acreage seeded since 1970.

An abnormally wet September provided good soil moisture but fields became too wet for drilling. This delayed planting on a considerable acreage until October. However, stands were well established before cold winter weather. Snowcover protection has been poor for most of the winter thus far, but wind damage has been light.

Nationally, growers planted 48.7 million acres in the fall of 1986 for the 1987 crop--10 percent less than the previous year.

POTATO STOCKS

Montana potato stocks on hand January 1, 1987, totaled 2.1 million cwt, up 50 percent from a year ago.

Storage of fall potatoes in the 15 major states totaled 177 million cwt on January 1, 1987. This is down 13 percent from last year but 2 percent above two years ago. Stocks accounted for 59 percent of production this year, the same percentage as last year. Types stored were: 79 percent russet, 17 percent white, and 4 percent red.

The 6 western states stored 121 million cwt of potatoes on January 1, 1987, down 7 percent from last year but 9 percent more than two years ago. Idaho and Washington stocks were down 7 percent from last year. Oregon stocks were down 5 percent. Colorado stored 9 percent fewer potatoes than a year ago and California stocks were off 20 percent.

GRAIN STOCKS HIGHER

Montana wheat stocks in both farm and off-farm storage postions on December 1, 1986 totaled 161.8 million bushels, up 55 percent from January 1, 1986. The stocks are down 13 percent from the 186.8 million bushels on hand September 1, and reflect a relatively slow movement off farms during the fall quarter. Farm stocks amounted to 124.0 million bushels or 77 percent of the total wheat in storage.

Winter wheat stocks at 83.2 million bushels are up 39 percent from January 1, 1986; hard red spring wheat stocks at 70.7 million bushels are up 83 percent; and durum stocks at 7.9 million are up 31 percent.

Nationally, all wheat stocks in all positions on December 1, 1986 are estimated at 2.66 billion bushels. Wheat stored on farms is 1.06 billion bushels. Off-farm stocks total 1.60 billion bushels, or 60 percent of the total stocks. The indicated disappearance from all positions September-November 1986 is 490 million bushels.

Durum wheat stocks in all positions on December 1, 1986 are placed at 154 million bushels.

MILK PRODUCTION

Montana's October-December milk production at 81 million pounds, was 7 percent lower than the same period last year. Average milk production per cow, at 3240 pounds, was up nearly 4 percent, but the reduction in the number of milk cows, from 28,000 head to 25,000 head, more than offset the increase in per cow production. Montana's dairymen fed an average of 14.5 pounds of grain and concentrates per head per day, up from 14.0 pounds last year. The cost per hundredweight of this feed was $6.45, down 55 cents from a year ago.

Nationally, the quarterly production of milk for the U.S. was 34.2 billion pounds, 4 percent below October-December 1985. The average number of cows in the U.S. during the October-December quarter was 10.6 million head, 1 percent below July-September 1986 and 5 percent below October-December 1985.

OCTOBER-DECEMBER MILK PRODUCTION

Manufactured Dairy Output

U.S. FARM INCOME

Net cash income for crop farms is expected to be down in 1986, going from 1985's average $27,000 per farm to about $25,000. Government payments to crop farms will rise more than 50 percent, cushioning this year's drop in commodity prices. Lower expenses should save crop farms more than $3 billion in 1986. For the livestock sector, net cash income per farm may climb more than $3,500. The average livestock operation, which typically includes some crop production, had cash income of more than $17,000 this year, because of higher prices, production, and Government payments, and lower expenses.

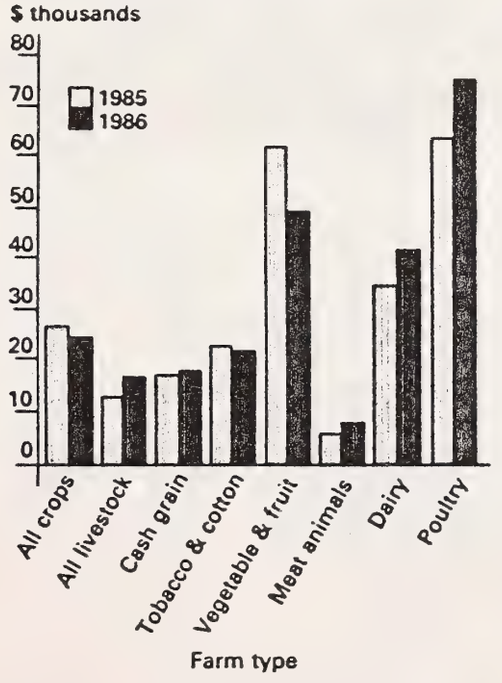
Under the Tax Reform Act of 1986, the after-tax cost of capital for all farm machinery should increase an average of 11 percent above costs under the current law. The cost of capital for tractors and long-lived equipment should be, respectively, 10.5 and 11.2 percent higher than under the existing law. Because of this, net investment in agriculture during 1986-90 will probably fall below the already negative level which is now occurring.

If marketing loans had been implemented for 1986/87, wheat exports might be only about 30 million bushels higher than without the loans, at a cost of $8 to $9 per added bushel. The per-bushel cost of extra corn and soybean exports would also be well above current market prices.

A large-scale acreage reduction program designed to idle 125 million acres, or about half of the program acreage base, could raise U.S. farm prices 30 to 40 percent above 1985/86 (by comparison, the 1986 program idled about 44 million acres). As a consequence, Government outlays for price and income supports would fall to nearly zero after several years, and farmers' net cash income would probably rise. In contrast, outlays for fiscal 1986, which include advance deficiency and dairy termination payments, totaled $25.8 billion.

However, large farm price increases would likely reduce U.S. farm exports 30 to 50 percent. Also, the mix of food purchased by domestic consumers would shift away from more expensive high-value products in response to a 30-35 percent rise in retail food prices. These declines would cut agriculture's contribution to U.S. GNP by $50 to $75 billion per year. As many as 2 million jobs might be lost on farms and in the inputs and marketing industries.

Net Cash Income Rising on Livestock Farms, Falling on Crop Farms



DECEMBER FARM PRICES

Montana farmers received slightly less for their products in December than a month earlier with the decrease mostly due to lower hay and barley prices. The Index of Prices Received for All Farm Products was 127 (1977 = 100) in December, 2 points below the November index. The All Crops Index at 105 was unchanged, although the Food Grain Index at 112 was up 1 point while the Feed Grain Index at 81 was down 4 points. The Livestock and Products Index at 148 was down 2 points reflecting an increase in cow marketings.

For individual commodities, price decreases were noted from November to December for winter wheat, barley, and hay. All other commodities increased except spring wheat, eggs, and wool which remained unchanged.

Nationally, the December All Farm Products Index of Prices Received by Farmers decreased 3 points from November to 121% of its January - December 1977 average. Lower prices for oranges, tomatoes, broilers, cattle, hogs, and turkeys, were partially offset by higher prices for cotton, strawberries, corn and lettuce. The index was 7 points below a year ago.

Month to month changes in grain prices were mixed. The all beef cattle and all hog prices were down, but calf prices were higher. Average lamb prices were up sharply, but broiler and egg prices were down. The all milk price was unchanged. Sharply lower prices for oranges and tomatoes were important factors in the month to month decrease of the commercial vegetable and all fruit indexes.

MEAT, POULTRY & DAIRY:
What Does the Future Hold?

Spurred by cost-savings at the farm and processing levels, per-pound retail prices for poultry have remained well below those of red meat products. The Consumer Price Index shows that while retail pork, and beef and veal prices climbed about 190 percent between 1962 and 1985, poultry prices rose a comparatively modest 112 percent. In 1985, consumers paid, on the average, 76 cents a pound for broilers and $1.05 a pound for whole turkeys. Retail Choice beef prices, in contrast, averaged $2.33 a pound, and pork was $1.62.

Nevertheless, better production practices have also helped hold the line on costs in the beef and pork industries. Gains in efficiency have kept retail increases for beef and pork below what they would have been in the absence of industry changes, helping maintain consumer demand for these productis over the last 20 years.

The story isn't much different in the dairy industry. Fewer but more productive milk cows are now supplying more than consumer needs. The number of cows declined from almost 22 million in 1950 to 11 million in 1985. At the same time, there was a significant increase in output per cow, from about 5,300 pounds in 1950 to over 13,000 in 1985--a 145 percent gain. Production per cow rose 26 percent just since 1975. Better producing cows pushed milk output from 117 billion pounds in 1950 to 144 billion in 1985.

Increases in milk supplies, however, have come in the face of relatively constant agregate demand. Increases in population from 1950 to 1985 have been largely offset by decreases in per capita consumption, from 341 pounds in 1950 to 243 pounds in 1984 (product-weight basis).

The mix of animal products we eat has changed significantly in the last three decades. Today, it's more chicken, turkey, beef, and cheese, and less pork, butter, and eggs. Even the types of meat and dairy products we eat are different. For example, shoppers can purchase brand-name poultry, choose their favorite parts, and even select pan-ready items.

What's more, the decade ahead is likely to bring more changes. Technological advances will mean a host of new products in the meat counter and dairy case. With little increase in overall consumption of animal products expected in the next decade, the beef, pork, poultry, and dairy industries will try to capture a larger share of a stagnant market by offering more higher profit processed products. Furthermore, industry structure is likely to change because of this slow-growing market. Beef producers, for instance, may follow the lead of their poultry counterparts and assume more functions from farm to retail.

A host of factors explain the changes in consumption of animal products, including growing incomes, new production and marketing technologies, and shifts in consumer preferences.

On the production side, the poultry industry has clearly been a leader in making physical and organizational improvements and in passing these benefits on to consumers. Improved productivity has enabled the poultry industry to produce and market chicken, turkey, and eggs at prices that have not risen as fast as overall consumer prices or prices of production inputs, such as labor, feed, and energy. A 1983 report by the Economic Research Service (ERS) estimated that, in the absence of technological advances, the retail price for chicken would have been $1.30 a pound in 1981 -- 56 cents above the actual retail price. Similarly, improvements in producing and processing turkeys meant that consumers paid only 93 cents a pound in 1981, instead of the $1.77 that would have been necessary to cover the costs of production under 1960 technology.

Americans Ate Less Whole Milk, Eggs, and Butter, and More Chicken, Turkey, and Lowfat Milk in 1985

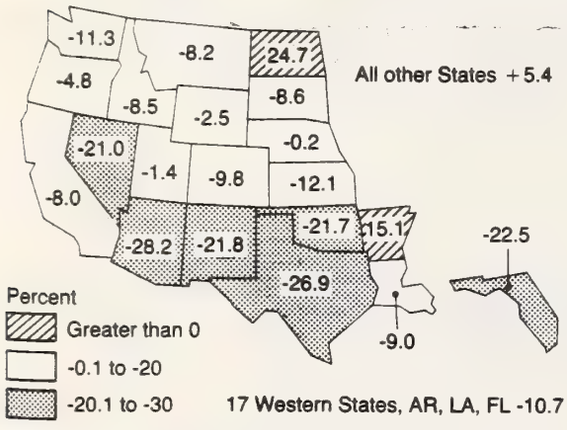
MONTANA DAIRY PRODUCTS

Dairy plants in the state produced 118,000 gallons of ice cream during November -- 2 percent less than in November 1985. Butter output at 158,000 pounds was down 9 percent. Creamed cottage cheese production at 265,000 pounds was down 16 percent. American cheese production at 160,000 pounds was down 39 percent from the same month a year ago.

Changes in Irrigated Acres, 1979-84

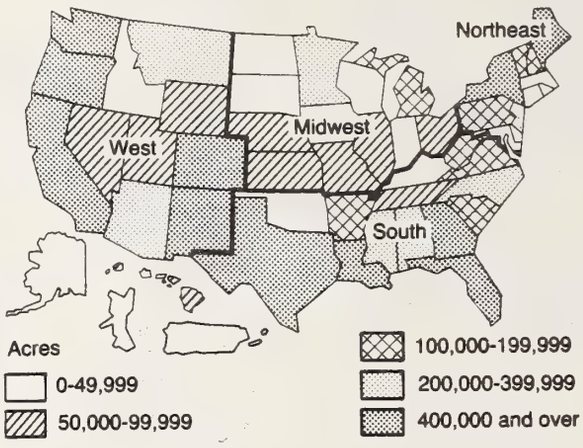
Most of the principal irrigation States saw substantial declines in irrigated acreage during 1979-84, due primarily to less favorable producer cost/price relationships.



Excludes Alaska, Hawaii, abnormal, and specialty farms. Source: 1979 and 1984 Farm and Ranch Irrigation Surveys.

Foreign Ownership of Agricultural Land

Foreigners owned 12.1 million acres of U.S. farmland in 1985—less than 0.6 percent of all U.S. land. Forest land accounts for 51 percent of these foreign-held acres.



1985 data.

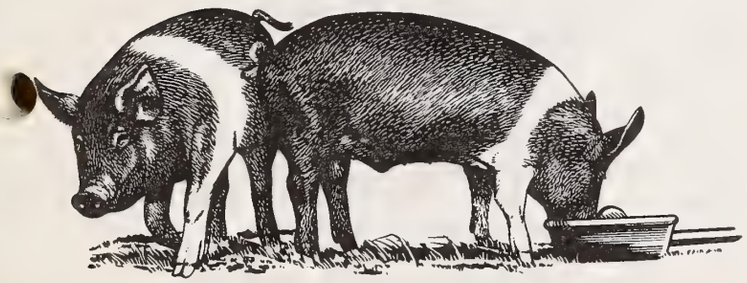
HIGHLIGHTS:

HOG COUNT UP SHARPLY
POTATO STOCKS INCREASE
CATTLE ON FEED DOWN
FEWER EGGS PRODUCED
BIG FIVE EXPORT CROPS



MONTANA HOG NUMBERS UP

A December 1 survey of producers revealed hog numbers increased substantially from last year. The State's December 1 Hog Inventory at 190,000 is up 41 percent from a year ago. The Breeding Hog Inventory at 21,000 is up 31 percent and the Market Hog Inventory at 169,000 is up 42 percent from December 1, 1985.

The Number of Pigs Produced in 1986 was 324,000 head, 33 percent more than in 1985. The Spring Pig Crop (December-May) at 156,000 was up 24 percent, and the Fall Pig Crop (June-November) at 168,000 was up 42 percent.

The U.S. inventory of all hogs and pigs is estimated at 51.0 million head on December 1, 1986. This is 3 percent below a year ago, 6 percent less than December 1, 1984 and the lowest December 1 inventory since 1975.

-- Breeding Hog Inventory at 6.61 million, is 3 percent below last year and 5 percent below two years ago. This is the lowest December 1 Breeding Inventory since Breeding Inventory estimates were first begun in 1963.

-- Market Hog Inventory at 44.3 million, is 3 percent below a year ago and 6 percent below two years ago.

The U.S. Pig Crop for 1986 totaled 82.3 million head, 4 percent below 1985 and 5 percent below the 1984 Pig Crop.

-- December 1985-May 1986 Pig Crop, estimated at 40.3 million head, is down 5 percent from both a year earlier and the comparable period in 1984.

-- June-November 1986 Pig Crop, estimated at 42.0 million head, is 3 percent below last year, and 5 percent below the June-November 1984 crop.

U.S. Hog producers intend to have 5.34 million sows farrow during the December 1986-May 1987 period, up from a year ago.

CATTLE ON FEED DOWN

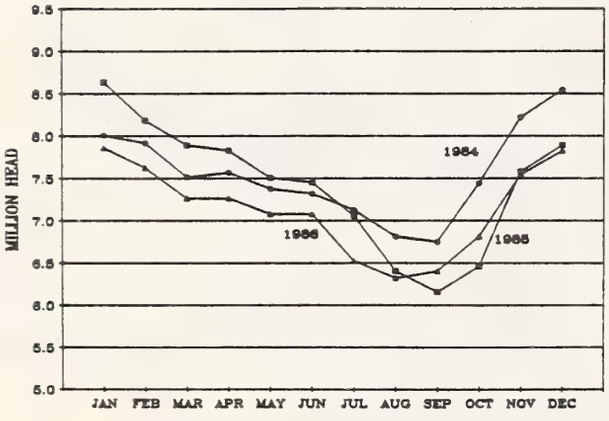
Cattle and calves on feed December 1 for slaughter market in the 7 states preparing monthly estimates totaled 7.83 million head, down 1 percent from a year ago and 8 percent below December 1, 1984.

MARKETINGS of fed cattle during November totaled 1.45 million, 5 percent above last year but 4 percent less than November two years ago.

PLACEMENTS of cattle and calves on feed in the 7 states during November totaled 1.81 million, up 3 percent from last year but 7 percent below November 1984. **NET PLACEMENTS** of 1.73 million for November are 2 percent above last year but 5 percent below November two years ago.

OTHER DISAPPEARANCE totaled 87 thousand head, compared with 76 thousand during November 1985 and 121 thousand during November 1984.

CATTLE ON FEED
7 STATES

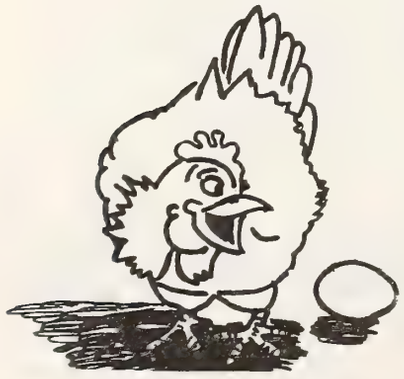


NOVEMBER LIVESTOCK SLAUGHTER

Montana slaughter plants produced 1.5 million pounds of red meat in November, 24 percent less than October and 15 percent below November a year ago.

Cattle slaughter amounted to 2100 head, 16 percent below last year. Hog slaughter at 2,000 head was 23 percent less than last year. The average liveweight for cattle was 1,015 pounds, 49 pounds heavier than a year ago. Average liveweight for hogs was up 5 pounds from last year at 231.

Nationally, commercial red meat production in November 1986 totaled 2.98 billion pounds, down 4 percent from November 1985. January-November red meat production, at 35.8 billion pounds was down 1 percent from a year earlier. The percentage changes in accumulated production by individual components were: Beef, up 2; Veal, up 4; Pork, down 6; Lamb and Mutton, down 6.



MONTANA EGG PRODUCTION DOWN

Montana's laying flocks produced 48 million eggs during the September - November quarter -- 8 percent less than the previous quarter and 6 percent less than the same period a year ago.

The average number of layers in the flocks during the quarter was 780,000, 2 percent less than the previous quarter and 4 percent less than a year ago.

TAKE PRIDE

"Take Pride in America" is a National Public Awareness Campaign to encourage everyone to take pride in the nation's natural and cultural resources. Our lands and resources must be protected for and by us, not from us. We must prevent thoughtless behavior by a few that reduces enjoyment for many.

The Campaign is a partnership of public and private organizations committed to ensuring the wise use of the resources that belong to all of us.

TAKE PRIDE IN AMERICA LOGO

POTATO STOCKS

Montana potatoes in storage on December 1 totaled 2,150,000 cwt, 34 percent above a year ago and amount to 96 percent of production. Most of Montana's potato production is certified seed and traditionally does not move out of storage until spring.

Nationally, storage of fall potatoes in the 15 major states totaled 204 million cwt on December 1, 1986. This is down 13 percent from last year but 1 percent above two years ago. Stocks accounted for 68 percent of fall production this year the same as last year. Russets were the main type stored accounting for 79 percent of the total in the 11 major states; whites made up 18 percent and reds, 3 percent.

Storage in the six western states was set at 137 million cwt, down 7 percent from last year, but 9 percent above 1984. Idaho stocks were 67.5 million cwt, down 9 percent from a year ago. Washington at 32.3 million cwt was down 4 percent; while Oregon at 17.0 million cwt was off 8 percent. Colorado stocks, totalling 13.6 million cwt were down 7 percent, and California at 4.70 million cwt was down 15 percent.

GLEANINGS

Farmers' expenses for interest on farm debt finally seem to be moving in a firm downward direction, observes economist Greg Hanson of the Economic Research Service. The farm sector's total interest expenses climbed from around $6.1 billion in 1975 to a peak of $21 billion in 1982 as interest rates rose and farmers took on additional billions of dollars of indebtedness to expand and upgrade their operations. The first significant drop in the interest bill came last year, Hanson says. Interest expenses declined an estimated 10% from 1984's $20.3 billion. He and other ERS analysts expect a further drop of 10%-13% this year.

Hanson lists several reasons why these expenses are now easing off. Interest rates are down from the highs of the early 1980's, and farmers are reducing their overall debt burdens because of the threat that large debts have posed to farm profitability and survival. In addition, bankers are extending less credit and have written off substantial amounts of bad debt.

The downward trend in interest payments (along with reduced expenses for fertilizer, fuel, and land) should help prop up future farm incomes, Hanson suggests. Spiralling interest expenses took a big bite out of net farm income during the last few years. From 1975 to 1979, farmers' interest expenses averaged $8.7 billion a year. In the first 5 years of the 1980's, the average was $19.3 billion. In other words, the sharp runup in interest expenses between the late 1970's and early 1980's slashed net farm income by an average of $10.6 billion a year. That's equivalent to more than one-third of total net farm income in 5 of the last 6 years. "The decline in interest expenses," concludes Hanson, "is a sign that much of the financial adjustment necessary to set the stage for recovery is now occurring."

The Farm Sector's Annual Interest Expenses Are Now Declining

*Excludes interest on farm household debt. *1985 estimated; 1986 projected.

BIG FIVE EXPORT CROPS

Although U.S. farm exports doubled in value from 1975 to 1981 -- increasing from $22 billion to $44 billion -- export sales of farm commodities had fallen nearly 30 percent from their 1981 high by the end of 1985.

Across the nation, 420 counties received 50 percent or more of total farm sales from just five "export-oriented" crops. Farm communities dependent on sales of corn, wheat, soybeans, cotton, and rice know what this means.

Together these five commodities accounted for 53 percent of the growth in U.S. farm trade from 1975 to 1981 and 76 percent of the subsequent decline.

In the peak year of 1981, these five export-oriented crops comprised 59 percent of U.S. farm exports. They made up more than half of U.S. farm exports in 1985, albeit of a much smaller volume.

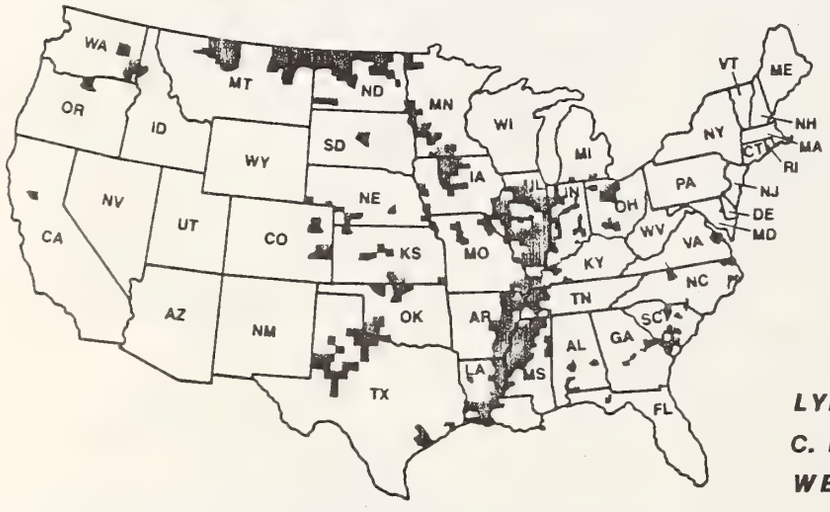
The importance of international sales from the five farm products is demonstrated by the significant share of U.S. production sold in world markets.

In the last 5 marketing years, an average of 54 percent of U.S. wheat production was marketed abroad. During the same marketing years, 26 percent of U.S. corn production was exported, 40 percent of soybeans, 47 percent of cotton, and 49 percent of rice.

U.S. exports also contributed heavily to total world trade in these commodities. In the marketing years from 1981 to 1985, U.S. wheat exports, on average, made up 36 percent of world wheat exports. The percentages for the other crops were: corn, 72 percent; soybeans, 52 percent; cotton, 28 percent; and rice, 18 percent.

These figures suggest the impact that changes in international trade may have on U.S. producers of these commodities, their communities, and even large geographic regions.

Export-Dependent Counties Are Concentrated in the Corn Belt and Delta States*



*Counties were classified as export-dependent when 50 percent or more of their farm sales in 1982 consisted of "export-oriented" crops—corn, soybeans, wheat, cotton, and rice.

Christmas Greetings

SHELVED WITH PERIODICALS

There are some Christmases that we recall more vividly than others, but all focus on the joy of giving and sharing with others. When I was a young boy I particularly remember the joy and anticipation on the faces of my parents and relatives when they surprised us with a bicycle, BB gun or sled. Our close family ties helped instill in us a strong sense of belonging and self-worth.

In addition to the celebration of the birth of Christ, Christmas has an extended meaning to me. It means a sharing of our joy and good fortune with others. It's experiencing the joy of giving, just as those three Wise Men did so long ago. It's seeing our children learning to give and experiencing the rewards of fulfillment that result.

During these times of economic and emotional stress, there are many who would appreciate assistance and some have too much pride to even ask for help. This year, our office staff will adopt a needy family for Christmas. We're all excited about making their Holidays a little brighter and in turn we'll share their joy.

On behalf of the office staff I want to thank you for your support throughout the year and want to wish each of you a very Merry Christmas and a Happy New Year!

NOVEMBER FARM PRICES

The November index of prices received by Montana Farmers and Ranchers for All Farm Products at 128 was down 2 points from October and down 18 points from November 1985. The All Crops index at 104 was 4 points above last month but 48 points below last year at this time. The Livestock and Products index at 149 was 8 points below October but 8 points higher than a year ago.

Crop items mostly registered price increases during November except for oats and hay. Prices were generally lower for all livestock items except lambs and eggs.

Nationally, the November All Farm Products Index of Prices Received by Farmers increased 4 points from October to 125 percent of its January-December 1977 average. Higher prices for oranges, lettuce, cotton, grains, eggs, and milk were partially offset by lower prices for broilers, grapefruit, strawberries, and apples. The index was 2 points below a year ago.

Crop prices generally increased from a month earlier. Food and feed grain prices increased from a month earlier, but all were well below a year ago except oats. Most commercial vegetable prices were above last year. Hog prices continued to decline but were still well above a year earlier. Steer and heifer prices were at the highest level since December 1985.

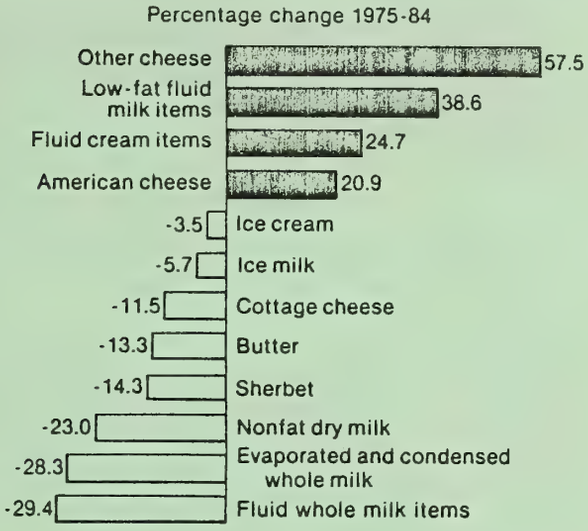
MANUFACTURED DAIRY PRODUCTS

Montana Dairy Plants manufactured 143,000 gallons of ice cream during October, 4 percent less than the same month last year. Creamed cottage cheese production at 318,000 pounds was 3 percent less than a year ago. Butter output at 192,000 pounds was down 2 percent. American cheese production at 194,000 pounds was down 3 percent from the same month last year.

UNITED STATES

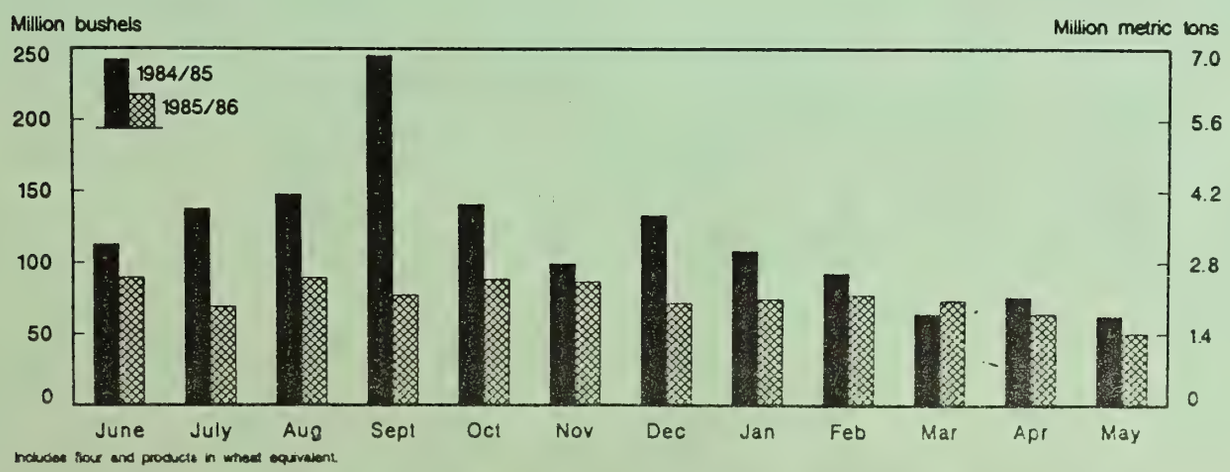
10-Year Change in per Capita Dairy Product Sales



REBOUND IN WHEAT EXPORTS EXPECTED IN 1986/87

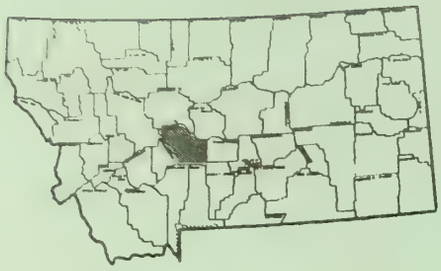
The decline in U.S. wheat export activity during 1985/86 was the most precipitous ever experienced. Loadings of 915 million bushels were down 509 million from the previous season and 856 million from the 1981/82 record. To reverse the decline in the U.S. share of world wheat trade, export bonus programs have been implemented during the past two seasons. During 1985/86, the Export Enhancement Program (EEP) favored certain markets by offering U.S. exporting companies extra quantities of CCC-owned stocks for sale to overseas markets. Program sales began slowly, but ballooned late last season. In anticipation of large supplies of lower-priced wheat, many customers deferred purchases until early in the 1986/87 marketing year. Current export commitments (outstanding sales plus shipments) are 27 percent above a year ago. Total shipments of SRW (the more favored EEP class) in July were the largest in 2 years. Adding to the potential for boosting overseas shipments of U.S. wheat was the Presidential announcement that the Soviet Union be included in the EEP. This offer is good only for the remainder of the long-term grain trade agreement year (October 1, 1985-September 30, 1986). The ultimate EEP will be determined by future subsidies that make U.S. wheat more attractively priced. However, competitors' responses also will bear heavily on the degree of success. For the season, U.S. wheat exports are forecast at 1.15 billion bushels, one-fourth higher than last year, but still nearly 20 percent under the average for the past five seasons.

U.S. Wheat Exports



Includes flour and products in wheat equivalent.

*featuring. . . . .*MEAGHER COUNTY



Meagher County is situated in central Montana with the Little Belt Mountains marking its northern boundary, and the Big Belt Mountains laying along its western border. Sections of the Lewis & Clark and Helena National Forests are scattered in various regions of the county. The Smith River flows northwesterly through Meagher County, while the Musselshell River originates in the south central region and flows east. White Sulphur Springs is the county seat, and the area has an annual average precipitation of 15.70 inches.

Although a little more than half the terrain is mountainous, agriculture is still a prominent industry. Meagher County ranked 18th and 23rd, respectively, among the cattle and sheep producing counties in the January 1, 1985 livestock inventories. December 1, 1984 hog numbers put the county in 37th place. Cash receipts for livestock and livestock products totaled $14,507,000 in 1984.

Most of the cropland is irrigated. Hay, oats, winter and spring wheat, and barley are all grown. Meagher County ranked 6th for all hay production in the 1985 crop production totals, as well as 40th and 41st for oats and winter wheat, respectively. Crops cash receipts came to $2,620,000 in 1984. Government payments added $531,00 for a total cash return of $17,658,000.

SURVIVAL SKILLS FOR TOMORROW'S FARMER

The successful farmers of the future will be better managers than today's farmers -- production managers, marketing managers, and financial managers. In other words, they'll be highly skilled at obtaining both technical and economic efficiency.

On the technical side, they'll seek always to squeeze the "last drop" of benefit out of each unit of input, whether land, labor, chemicals, or machinery. New technologies in both crops and livestock will enable them to monitor the production process and maintain peak efficiency.

Although the prices farmers receive for their products will probably continue to fall in relation to the prices they pay for their inputs, this ratio has been drifitng downward for decades. Greater productivity from improved inputs made up the difference. There is no reason to think that future downward pressure on prices will prevent efficient farmers from maintaining net farm income at acceptable levels in most years.

Financial Managers, Too

But focusing on technical efficiency alone will not get the job done. Farming is becoming more risky, and capital requirements are higher than they are in other industries. Thus, business expertise in general, and particularly financial management skills to operate in a high risk environment, will be every bit as important as production skills.

The ever-changing business environment, will require proficient use of accounting, financial statements and analyses, budgeting and planning, and sophisticated office management procedures. The successful farmers will better understand the risks of the economic and financial environment and utilize the best available marketing and financial management techniques to counter or control those risks.

On the business side, the emphasis will be on controlling costs and maximizing net income from each farm enterprise, rather than on maximizing volume and gross sales. For example, attention will shift to obtaining higher calving percentages and weaning weights rather than more cows, limiting applications of fertilizer to maximize net returns rather than yields, and producing crops with the most efficient machinery rather than the largest.

Increasing price variability in world markets will intensify the need for reliable marketing information and forecasts. While such information is provided by USDA and many other public and private institutions, the greater level of price uncertainty will strengthen the incentive for farmers to acquire their own information.

Furthermore, emerging technologies in telecommunications and microcomputer systems will offer farmers instant access to the best information available for making production, marketing, and financial decisions. The ability to accumulate accurate, detailed information and to form reliable expectations from this information will become crucial to survival in a farm business.

Opportunities Along with Risks

Increased fluctuation in financial conditions and markets will present opportunities for gains as well as losses. Successful farmers will be those who maintain the resiliency to survive during the busts so they are in a position to take advantage of the booms. This resiliency will be reflected in the way farm investment is financed, in the organizational structure of the farm, and in the use of technologies so that production can respond to changing conditions.

Survival Skills Cont. Page 2

Survival Skills Cont. from Page 1

Structurally, the adjustment seems to be away from the savings-financed sole proprietorships that have long been traditional to U.S. family farming. Partnerships and family-held corporations are, to some extent, replacing the sole proprietorships for commercial-size farms. At the same time, debt financing is declining as the principal means of acquiring the resources necessary for farming. Leasing and various methods of outside equity financing are growing in importance.

Overall, these changes appear to represent the slow emergence of a more "industrial" type of business organization and financial structure in agriculture. Whatever drawbacks this may have -- outside financing, for instance, may entail some loss of control over assets by farmers -- it should improve the financial resiliency of the agricultural sector. Resilient farms will provide the agricultural industry of tomorrow with the ability to adjust to an unstable environment.

Although the future is impossible to predict, the present farm crisis seems to be the painful part of a permanent shift to a new baseline environment for agriculture. If so, it should be noted that American farmers have successfully adapted to changes of this magnitude in the past. Moreover, many farmers -- a majority, in fact -- have already made adjustments to position themselves so they can survive, and prosper, in the challenging economic and financial environment of the next few decades.

BULLETIN NOW AVAILABLE

The 1986 **Agricultural Statistics Bulletin** is now available for distribution. This year's issue is a continuation of a series of publications going back to 1946 -- forty years ago.

The Bulletin is provided free of charge to those who voluntarily provide information for input to the publication. This includes participation in current surveys. Others are charged $5.00 per copy to help cover publication costs. To obtain a copy of the 1986 Bulletin please write:

CATTLE ON FEED

Cattle and calves on feed November 1 for slaughter market in the 7 States preparing monthly estimates totaled 7.55 million head, down fractionally from a year ago and 8 percent below November 1, 1984.

MARKETINGS of fed cattle during October totaled 1.59 million, 1 percent above last year but 4 percent less than October two years ago.

PLACEMENTS of cattle and calves on feed in the 7 States during October totaled 2.40 million, down 14 percent from last year and 6 percent below October 1984. This is the lowest October placement total since 1981. Net placements of 2.32 million for October are 14 percent below last year and down 5 percent from two years ago.

OTHER DISAPPEARANCE totaled 81 thousand head, compared with 85 thousand during October 1985 and 110 thousand during October 1984.

FARM WORKERS DECLINE - WAGE RATES INCREASE

A total of 3.04 million people worked on the nation's farms and ranches during the week of October 12 - 18, 1986. This compared with 3.14 million workers during the comparable survey week in 1985. Included in the work force were 1.29 million self-employed farm operators, 550,000 unpaid workers, and 975,000 workers hired directly by farm operators. An additional 229,000 workers were Agricultural Service Employees. Self-employeed, unpaid, and hired worker numbers all dropped about 5 percent from last year while agricultural service workers increased 22 percent.

The all hired farm worker wage rate in October was $4.83 per hour, up 27 cents from a year earlier. Workers paid on an hourly basis earned $4.56 per hour, compared with $4.41 in October 1985. Wage rates for field and livestock workers were $4.61 and $4.37, respectively. Last year field workers made $4.47 per hour and livestock workers earned $4.24.

During the October 1986 survey week, self-employed persons worked an average of 48.7 hours, 0.8 hours more than in the comparable week in 1985. Unpaid workers, who worked 15 hours or more during the week, averaged 37.0 hours, compared with 38.6 a year earlier. Hired workers spent an average 39.9 hours doing agricultural work, up 1.3 hours from October of last year.

Perquisites and other benefits such as housing and food were provided to 52 percent of the hired workers. Housing was provided to 13 percent of the workers compared with 14 percent in October 1985.

During the week of October 12 - 18, 1986, rain slowed grain harvest in the Corn Belt and Southern Great Plains. Corn was 37 percent harvested, 3 points below the 5-year U.S. average. Soybeans were 37 percent harvested compared with a 46 percent average. Cotton harvest, at 37 percent, was 7 points above average. However, harvest of the Texas cotton crop lagged 3 points below their state average. Winter wheat planting was active in many states and was 72 percent planted by week's end. Apple harvest was well advanced on the east coast. Vegetable and melon harvest were active in Arizona. Favorable weather in the northwest resulted in normal harvest activities.

*featuring.....*CASCADE COUNTY

Cascade County was created in December of 1887 and lies in central Montana. The county is crisscrossed by numerous rivers and streams. The Missouri River enters along the western border and flows northeasterly through the county, while the Smith River enters along the southern boundary and flows north to join the Missouri near Ulm, Montana. The Sun River enters along the northwestern border and joins the Missouri near Great Falls. The terrain is characterized by rolling plains and river valley, except for the extreme southeastern corner that is mountainous and timbered. A section of the Lewis & Clark National Forest is nestled there, and the Little Belt Mountains lie along the southern border. Great Falls is the county seat.

Being well suited to agricultural production, Cascade County supports a variety of agricultural interests. In 1985 crop production, the county ranked 7th in winter wheat, 12th in barley, 13th in durum wheat, and 14th in spring wheat production. Hay, oats, and corn are also grown. Most of the cropland is not irrigated.

Cattle raising is a major livestock interest as Cascade County came in 10th in the state in the January 1, 1985 inventory. The sheep inventory on the same date showed the county in 19th place, and the December 1, 1984 hog count put Cascade 18th among the hog raising counties.

Cash receipts from the sale of crops added up to $23,655,000 in 1984. Livestock receipts were $31,804,000, while government payments came to $8,022,000. Cash receipt total for 1984 amounted to $63,481,000.

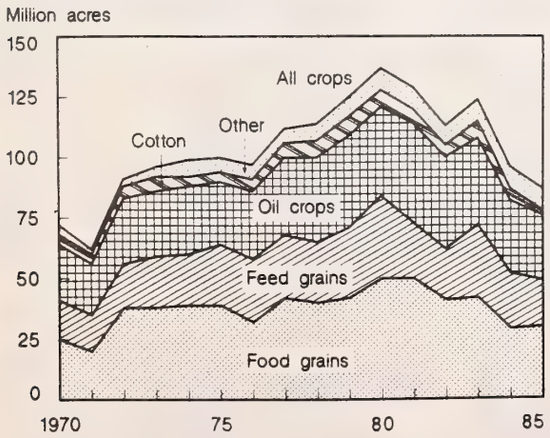
HIGHLIGHTS:

CROPLAND USE
U.S.D.A.'s NEW SURVEY PROGRAMS
AG PRICES INCREASE
PASTURE & RANGE CONDITION GOOD

ACREAGE EQUIVALENTS OF CROPS EXPORTED LOWEST SINCE 1971

U.S. agricultural exports for fiscal 1986 are forecast to be down 13-15 percent from last year's 126 million tons and more than 34 percent below the 1980 peak. U.S. and world stocks of major commodities are at record or near-record levels. Without a dramatic upturn in world demand, all exporters will be facing an increasingly competitive market and downward pressure on world prices. U.s. farmers look to export markets for disposing of a significant portion of domestic production and, in turn, for strengthening domestic prices. Because the demand for most commodities is inelastic, changes in the volume of commodities exported can have substantial impacts on world and domestic prices.

Acreage Equivalents of Crops Exported, United States

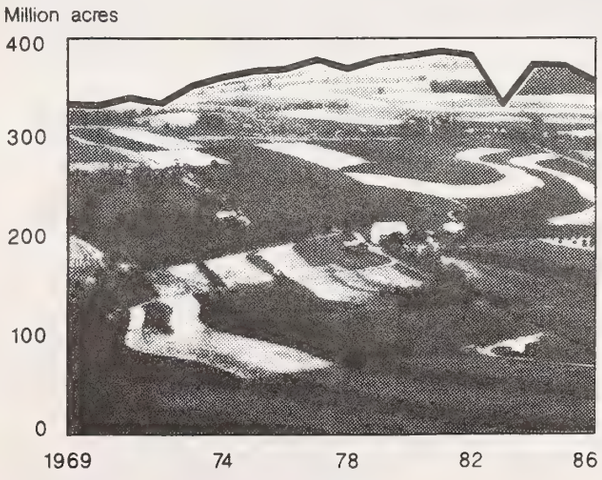


U.S. CROPLAND

Cropland used for crops--harvested, failed, and summer fallowed--is expected to total 356 million acres in 1986, down 16 million from last year. In 1986, farmers diverted from production 18 million more acres than a year ago. Peak acreage of cropland used for crops was 387 million in 1981.

The reduction in cropland harvested from 1985 to 1986 continues a trend that began in 1982. Largest reductions are expected in the Corn Belt (down 5 percent) and the Southern Plains (down 11 percent). Despite the decline in harvested acreage, output per acre has increased. The index of crop production per acre reached a high of 119 in 1985 (1977=100), 7 points above the 1984 level. The previous high was 116 in 1982.

Cropland Used for Crops Down 16 Million Acres from Year Ago



USDA TO MODIFY CROP and LIVESTOCK SURVEY PROGRAMS

The U.S. Department of Agriculture's National Agricultural Statistics Service will collect data for livestock inventories, on-farm grain stocks, and crop acreage and production through quarterly integrated surveys rather than individual surveys, starting next year.

The changes in the crop and livestock data collecting and estimating program follow extensive study and industry input. The new surveys will be on a multiple frame (area and list sample) probability basis and will be conducted between the 1st and 15th of March, June, September and December, with the first of the month as the official reference date.

A special January survey will use a NASS list of producers to gather most of the data needed to estimate cattle and sheep numbers at the beginning of the year. This information will be supplemented by an update of information from the December area frame survey for operations that are not on the list frame. NASS will continue a midyear national cattle survey, but the reference date will be June 1 instead of July 1 as in past years.

Benefits of the new program:

--The altered survey techniques will improve the NASS estimating program by putting all major crops on a probability sampling basis, and will reduce the number of total contacts with farmers while maintaining reliability for all estimates.

--Estimates of acreage harvested, yield and production of small grains will be developed from the September survey and issued in October. In past years, surveys were conducted from September through November, depending on the area of country, and estimates were not available until late December.

--Previously, much data was collected without a specific reference date, so estimates were not as precise as they will be under the new system.

--With the NASS move to integrated surveys that cover more crops and livestock than in the long-standing separate surveys, more of the farmers contacted are likely to have information to report. Also, combination surveys are more cost-effective.

SUMMARY OF THE NEW SERIES OF SURVEYS AND REPORTS:

	Small grain annual summary	Oct. 8	Crop Production

MONTANA FARM PRICES MOSTLY UP

Montana farm crop prices strengthened during October while most livestock prices weakened. The index of all farm products on October 15 at 129 percent of the 1977 base was up 2 points from September, but down 15 points from a year ago. The all crops index at 104 went up 7 points from last month but was 45 points below October 1985. The livestock and products index at 152 was down 3 points from September but was 12 points above a year ago.

Spring wheat and durum had the largest price increases of the grains while hogs saw the largest price drop in the livestock items. Steers and heifers, cows, and calves had only slight price changes during the month.

For the nation, the October all farm products index of prices received by farmers, at 121 percent of its January-December 1977 average, decreased 1 point from September. Lower prices for hogs, corn, soybeans, eggs, and lettuce were partially offset by higher prices for tomatoes, strawberries, milk, broilers, and most small grains. The index was 2 points below a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes, and farm wage rates for October was 160 percent of its 1977 average. The index dropped 1 point from July and 2 points from last year. Lower feed and fertilizer prices for the quarter more than offset the increase in feeder livestock prices. The index for feed was the lowest since October 1978.

1/ July 1986 prices paid index. 2/ Ratio of index of prices received by farmers to index of prices paid, interest, taxes, and farm wage rates.

PASTURE and RANGE

Montana's pasture and range condition on November 1 at 88 percent is 34 points above last year at this time and the highest November 1 condition figure since 1982. Stock ponds and reservoirs were filled earlier by good rains which also were beneficial in the regrowth of native grasses. A lot of good fall grazing has been available on stubble fields and hayland. By November 1 about 85 percent of the cattle and 90 percent of the sheep had been moved from summer ranges which is about normal.

U.S. WHEAT CROP
RED MEAT PRODUCTION INCREASES
LESS MILK PRODUCED
MORE CATTLE ON FEED
featuring.....GOLDEN VALLEY COUNTY

U.S. WHEAT PRODUCTION

The total U.S. 1986 wheat crop at 2076.7 million bushels is 14 percent under last year and the smallest crop since 1978. It is nearly 1/4 less than the record produced in 1981. Wheat production in the U.S. has been decreasing each year since 1981, except for a small increase in 1984.

However, the total supply of wheat on September 1 (production plus carryover, plus imports) was at a record high 3982.7 million bushels. Domestic use, projected to be 1075.0 million bushels, was only higher during 1983 and 1984. Exports are expected to be above last year, but substantially below all the other years of the 1980s. If these projections are realized, the ending stocks on May 31 will be only slightly less than the record high of last year.

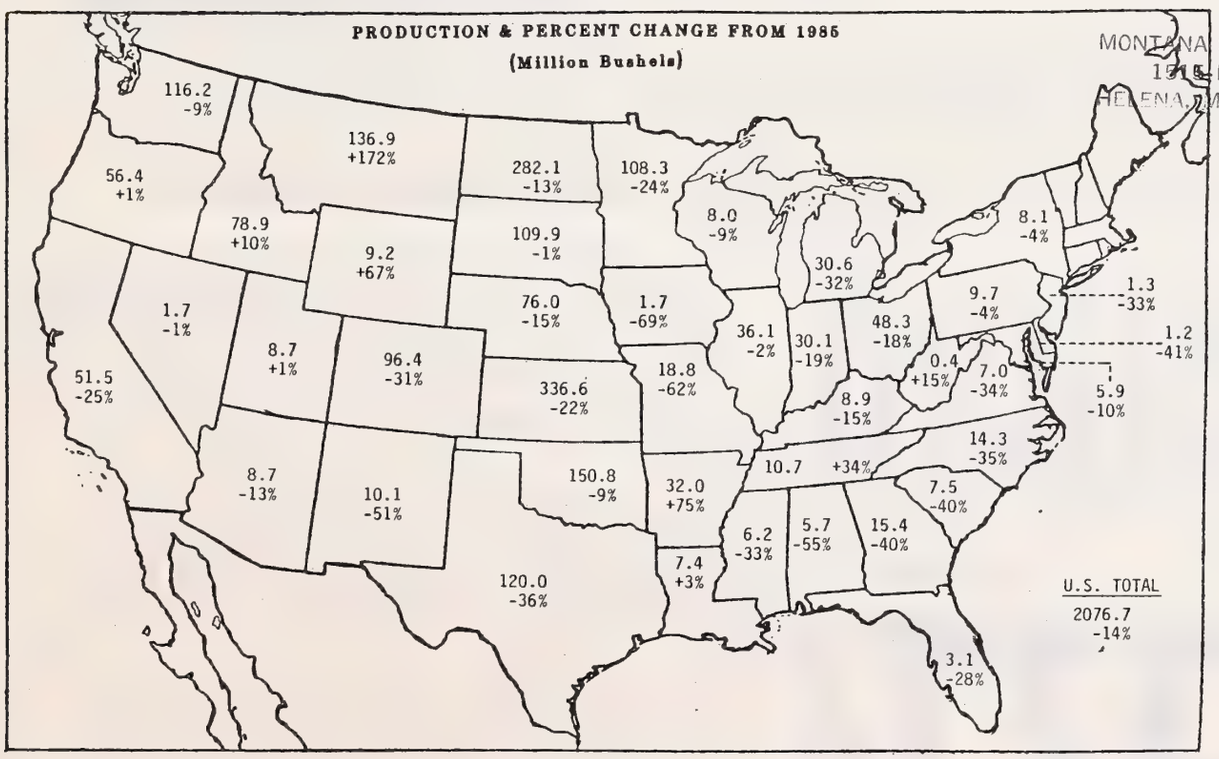
ALL WHEAT PRODUCTION -- 1986



CATTLE ON FEED UP

Cattle and calves on feed October 1, 1986 for slaughter in the 13 Quarterly States totaled 8.20 million head, up 3 percent from October 1 last year but 9 percent below 1984.

The cattle on feed inventory included 5.18 million steers and steer calves, 6 percent above last year but 8 percent below 1984. This group represented 63 percent of the total October number on feed compared with 62 percent in 1985. Heifers and heifer calves accounted for 2.99 million, down 1 percent from last year and 11 percent below 1984.

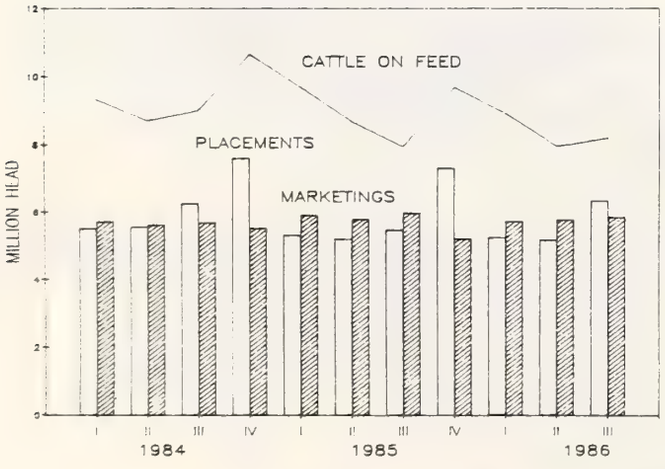
PLACEMENTS of cattle and calves on feed during the July-September quarter totaled 6.33 million, up 15 percent from last year and 1 percent above the comparable period in 1984. **OTHER DISAPPEARANCE** of 233 thousand head leaves **NET PLACEMENTS** at 6.09 million.

MARKETINGS of fed cattle for slaughter during July-September totaled 5.85 million, 2 percent less than the same quarter a year ago but 3 percent above 1984.

EXPECTED MARKETINGS FOR OCTOBER-DECEMBER UP 3 PERCENT

Cattle feeders expect to market 5.40 million head during the October-December quarter of 1986. This would be 3 percent above the fourth quarter marketings in 1985 but 2 percent below 1984.

CATTLE ON FEED, PLACEMENTS, MARKETINGS
BY QUARTERS FOR 13 STATES



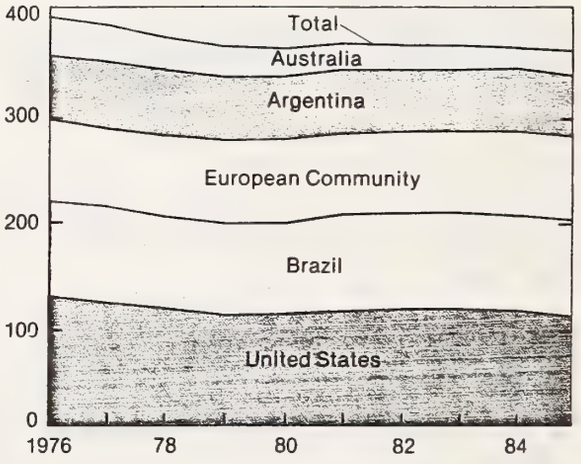
SEPTEMBER LIVESTOCK SLAUGHTER

Montana slaughter plants produced 2.2 million pounds of red meat during September, 14 percent above August and 15 percent more than September 1985. Cattle slaughter, at 3,100 head, was up 24 percent from last year, but hog slaughter at 2,500 head was down 17 percent.

Nationally, commercial red meat production in September 1986 totaled 3.26 billion pounds, up fractionally from September 1985. January-September red meat production, at 29.3 billion pounds was virtually the same as a year earlier. The percentage changes in accumulated production by individual components were: beef, up 3; veal, up 7; pork, down 5; lamb and mutton, down 5. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

Cattle in Major Beef-Producing Countries

Million head



Inventory taken as close to January 1 as possible.

LARGE SURVEY UNDERWAY

Montana's largest agricultural survey of the year is underway. The Fall Acreage and Production Survey is designed to measure final end-of-season statistics of all the major crops in the state. Other important uses of the survey are to establish crop figures by county, and winter wheat planted for harvest in 1987.

Nearly half of the state's 23,600 farmers will be contacted by either mail or telephone for data on their individual operations. Questions will refer to acres and production by irrigated, summerfallow, and recrop cropping practices.

Statistics from the survey are important in providing an accurate picture of crop production for the state and for each county. The results are also used to administer farm programs, and also to help guide payments under various disaster programs.

MILK PRODUCTION DOWN

Montana's July-September milk production at 85 million pounds was 8 percent below the same period last year. The size of the state's milk cow herd declined 2,000 head from last year to 26,000 head. Grain and other concentrates fed to milk cows on October 1 averaged 13.5 pounds per head, down 1.5 pounds from last year. The cost per hundredweight of these feeds fell 35 cents to $6.55/cwt.

Nationally, milk production during the third quarter of 1986 totaled 35.9 billion pounds, 2 percent below July-September 1985. The total number of milk cows averaged 10.7 million head during the quarter, 3 percent less than last year.

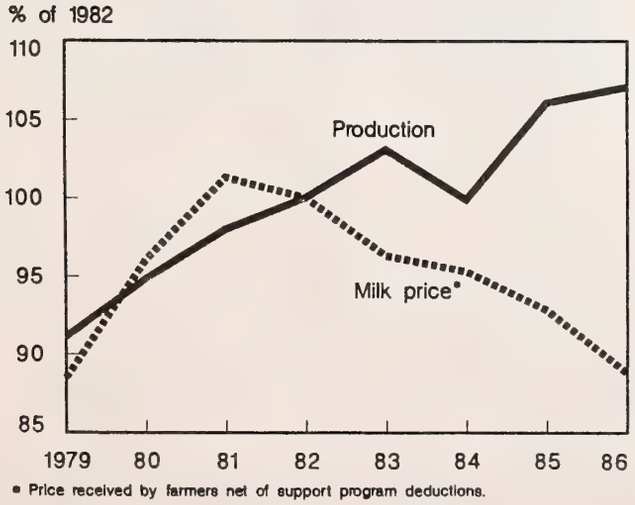
Milk Price and Production



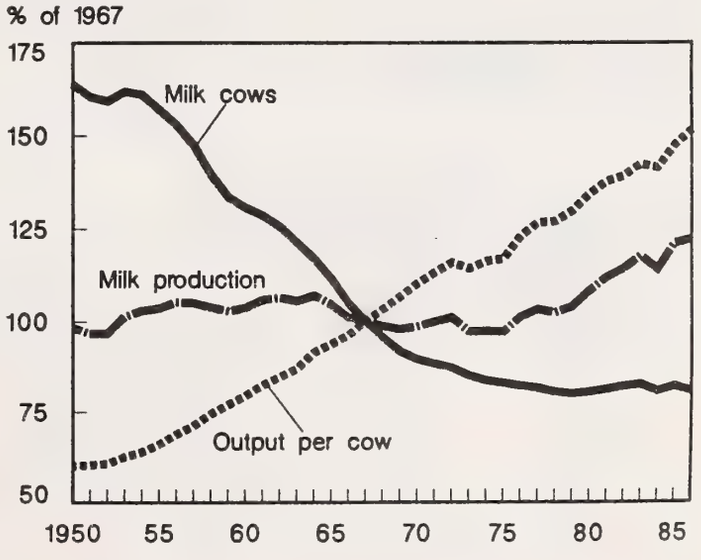
* Price received by farmers net of support program deductions.

THE 1980-1985 SHIFT IN MILK SUPPLY

Milk production increased 12 percent between 1980 and 1985, despite declining prices and returns. Milk prices, net of price-support deductions, declined 3.3 percent during 1980-85, slightly more than decreases in all crop prices but not as sharp as the fall in other livestock prices. The large shift in the supply curve (more milk supplied at the same price) probably was unprecedented. Lower feed prices cushioned some of the milk price decline, but returns over concentrate costs in 1985 were 2 percent less than in 1980. Returns over all cash and replacement costs fell 14 percent during the same period. Accounting for inflation makes these drops much more pronounced. Real returns over cash and replacement costs in 1985 were down a third from 1980 and close to the level of 1975--when only four-fifths as much milk was produced.

Several factors caused an increase in milk production despite lower prices. Productivity gains were a major contributor to the supply shift. Genetic improvement and better management of feeding, reproduction, and herd health played their roles. However, substantial productivity gains have been an important feature of dairying for several decades. It is possible (but by no means clear) that productivity gains have accelerated during the eighties.

Milk Per Cow, Cows, and Production



*featuring.....*GOLDEN VALLEY COUNTY

Golden Valley County occupies approximately 749,881 acres of land in central Montana. Except for the extreme northwest corner that is taken by a section of the Lewis & Clark National Forest and the Big Snowy Mountains, the land is characterized by rolling prairie. The Musselshell River runs the entire width of the county in the south. Ryegate is the county seat, and the average annual precipitation for the area is 12.49 inches.

The county supports a variety of agricultural interests, including the production of winter and spring wheat, barley, oats, hay, and corn. The cropland is largely non-irrigated.

Sheep, cattle, and hogs are all raised in Golden Valley County. Hog numbers brought the county a rank of 13th in the December 1, 1984 hog inventory. Golden Valley came in 13th and 43rd for the cattle and sheep inventories, respectively, on January 1, 1985.

Cash receipts from crops amounted to $2,044,000. Livestock and products contributed $12,027,000, while Government payments added $1,526,000 for a cash recept total of $15,597,000 for Golden Valley County in 1984.

CROP PRODUCTION HIGHLIGHTS

Montana's 1986 wheat crop didn't break any records, but well exceeded the output of the previous two years. Based on preliminary end-of-season surveys, the State's wheat crop estimated at 136.9 million bushels is 2.7 times greater than last year and 1.3 times more than 1984. Even with two years of serious drouth, annual average wheat production during the decade of the 80s is outpacing the 70s by about 5 percent. Winter wheat, which accounted for 57 percent of the total during the 70s, fell to 51 percent during the first 7 years of the 80s. By class, **winter wheat production** at 66 million bushels, is up almost 3 times above last year. **Hard spring wheat** at 67.5 million bushels is up about 2.5 times, and **durum** at 3.4 million bushels is up 2.3 times.

Barley production in Montana was estimated at a record high 89.4 million bushels, nearly 3 times more than a year ago. Average annual production during the 1980s is running 15% above the 1970s. **Oats production** for the state estimated at 3.7 million bushels is 1.6 times more than last year. **Hay production** this year forecast at 4.7 million tons is 1.7 times more than a year ago. Alfalfa, at 3.3 million tons, is up 1.9 times from last year, while other hay at 1.4 million tons is up 1.4 times. **Sugarbeet production** forecast at 966 thousand tons is about 1.2 times more than last year.

WHEAT & BARLEY MOVEMENT DECLINE

Montana **wheat** shipped to out-of-state destinations in December 1985 - May 1986 was 35 percent below the same period last year, at 28.1 million bushels. Wheat originating in northeast and north central Montana showed the strongest declines--shipments were off 45 and 39 percent, respectively. Wheat movement out of western Montana and the southeast corner were up substantially. Rail movement was down 37 percent from last year, and truck movement was off 30 percent.

Western destinations received 40 percent less wheat compared with last year, but eastern destinations showed an 81 percent increase. Other destinations, mostly south and southeast of Montana, showed a 35 percent increase.

Western destinations received 88 percent of the total shipments, while eastern destinations received 7 percent, and other destinations received 5 percent.

Montana **barley** shipped to out-of-state destinations December 1985 - May 1986 amounted to 6.0 million bushels, 44 percent less than a year ago. Rail movement fell off 45 percent, and truck movement was down 44 percent.

Barley going west was down 37 percent, eastern movement was down 67 percent and all other destinations were 41 percent below a year ago.

PASTURE & RANGE CONDITIONS IMPROVE

Pasture and range conditions remained above normal during September on the state's farms and ranches. The wet weather during September prompted some regrowth of native grasses. The October 1 condition of 82 percent of normal was the highest October 1 condition reported since 1982. Fall grazing prospects are very good and most stockwater reservoirs are full. About 40 percent of the cattle and 50 percent of the sheep were moved from summer ranges by October 1.

HOG INVENTORY DOWN

Inventory of all hogs and pigs on September 1, 1986, in the 10 States conducting quarterly hog surveys is estimated at 39.6 million head, 5 percent below last year. This is 8 percent below September 1, 1984 and the lowest September 1 inventory since 1975.

--Breeding inventory, at 4.84 million head, is 10 percent less than a year ago, and 13 percent below two years earlier. This is the lowest September 1 breeding inventory since 1973, when estimates for these comparable 10 States became available.

--Market hog inventory, at 34.7 million head, is 5 percent below last year, 8 percent less than 1984 and the lowest September 1 market hog inventory since 1975.

PIG CROP: The June-August 1986 pig crop was 15.9 million head, 6 percent below last year and 8 percent below two years ago. There were 2.03 million sows that farrowed during June-August, down 7 percent from a year earlier and 10 percent less than the same period two years ago.

Sows farrowing during June-August 1986 averaged 7.79 pigs per litter compared with 7.73 last year and 7.60 during the comparable period two years ago. The 7.79 pigs is a record high and continues the trend of a gradual increase in pigs saved per litter.

FARROWING INTENTIONS: Hog producers in the 10 quarterly States intend to farrow 2.06 million sows during September-November of this year. This is 9 percent fewer than during the comparable period in 1985, and 11 percent below 1984.

Farrowing intentions for December 1986 - February 1987 quarter are 1.83 million head, 6 percent below a year earlier and 7 percent below two years earlier.

CATTLE ON FEED UP

Cattle and calves on feed September 1 for slaughter market in the 7 States preparing monthly estimates totaled 6.40 million head, up 4 percent from a year ago but 5 percent below September 1, 1984.

MARKETINGS of fed cattle during August totaled 1.66 million, 2 percent below last year and 1 percent less than August two years ago.

PLACEMENTS of cattle and calves on feed in the 7 States during August totaled 1.81 million, up 20 percent from last year and 8 percent above August 1984. This is the highest August placement total since 7 State estimates were begun in 1971. **NET PLACEMENTS** of 1.74 million for August are 20 percent above last year and up 8 percent from two years ago.

OTHER DISAPPEARANCE totaled 70 thousand head, compared with 62 thousand during August 1985 and 61 thousand during August 1984.

AUGUST LIVESTOCK SLAUGHTER

Montana slaughter plants produced slightly less than 2 million pounds of red meat during August, 7 percent more than last month, but 14 percent lower than the August 1985 production.

Cattle slaughter, at 2,600 head, was down 13 percent from last year. Hog slaughter, at 2,500 head, was down 12 percent.

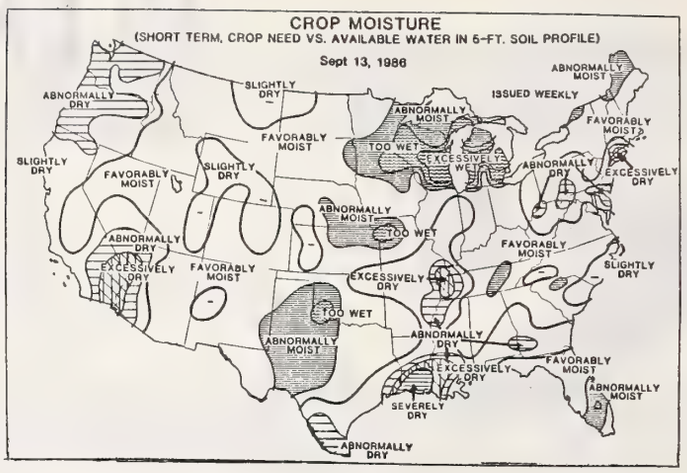
Nationally, commercial red meat production in August 1986 toaled 3.18 billion pounds, down 6 percent from August 1985. January-August red meat production, at 26.0 billion pounds, was down fractionally from a year earlier. The percentage changes in accumulated production by incividual components were: beef, up 3; veal, up 7; pork, down 5; lamb and mutton, down 6.

SURVEY RESULTS

EGG PRODUCTION

Montana poultrymen produced 52 million eggs in the June-August quarter, 2 percent less than a year ago. The average number of layers on hand during the quarter at 793,000 was down 4 percent from last year.

The Nation's laying flocks produced nearly 17.0 billion eggs during the June-August quarter, slightly more than during the same period in 1985. The number of layers averaged 272 million, slightly more than a year ago.



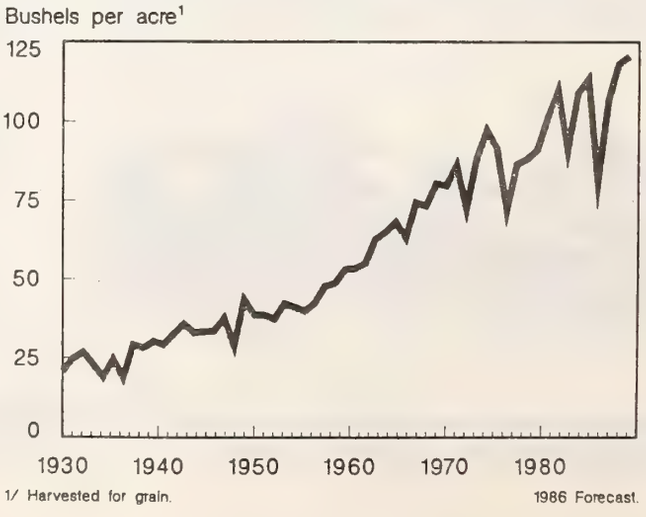
FEED GRAIN SITUATION

Although the 1986 feed grain program helped to hold plantings to 120 million acres, the U.S. feed grain crop is forecast at 252 million metric tons, down 8 percent from--and second only to--last year's record harvest. Corn is forecast to supply about 83 percent (8.3 billion bushels) of the expected total, while about 9 percent (873 million bushels) is sorghum. Following record production in 1984 and an excellent harvest in 1985, this year's barley crop is forecast to reach a new high of 626 million bushels.

Growing conditions in most of the major corn producing regions have been near ideal. As the weeks passed through the first half of the summer, Government and trade estimates of the corn crop edged upwards. The projected corn yield of 119.7 bushels per acre tops last year's record by 1.7 bushels. However, the favorable weather has not been evenly distributed, as several southeastern States have suffered through a long drought that has been called the worst on record.

Drought in the southeast has also adversely affected hay production and pasture and forage conditions, causing severe feed shortages on cattle and dairy enterprises. Some of the shortages will be offset by feed cost-sharing payments that make Government grain stocks available to affected livestock producers.

Corn Yield Continues Long Upward Trend



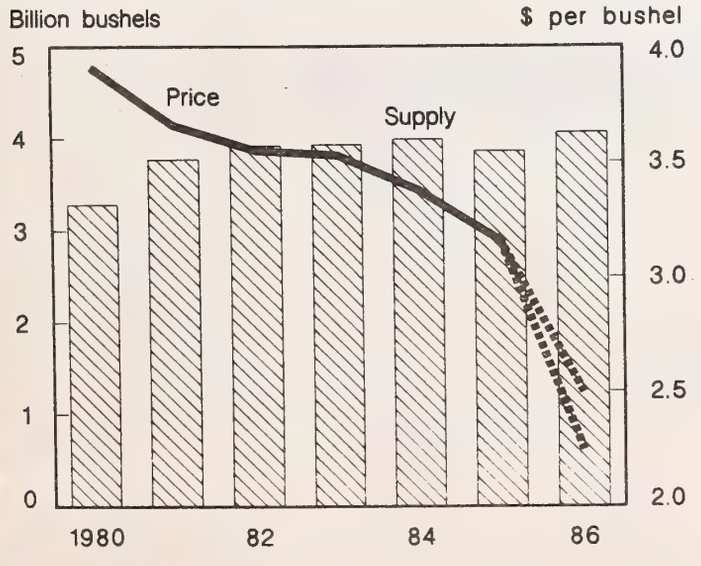
WHEAT SITUATION

U.S. wheat production, aided by generally good growing conditions, has ballooned to record heights in several of the last 6 years, resulting in excessive stocks. Government efforts to reduce stocks have depended heavily upon acreage reduction programs, although the new farm bill puts additional empahsis on expanding exports. Participation in the 1986 acreage reduction program, at 84 percent, and less-than-ideal weather in winter wheat areas lowered the 1986 U.S. wheat harvest to a 6-year low of 2.16 billion bushels, 11 percent less than 1985.

Despite the smaller harvest, a record 4.07 billion bushels are available for the 1986/87 marketing year. Increased carryin stocks and the expected record Hard Red Spring crop will overshadow reduced Hard Red Winter output, resulting in a bread wheat supply of 3.03 billion bushels, an alltime high. Meantime, soft wheat stocks probably will decline 6 percent from last season due to the short Soft Red Winter harvest. Durum supplies will represent about 2 years of normal use.

The world wheat situation also features continued record supplies, a modest pickup in use, increased trade, and depressed prices. Even though the United States and the Soviet Union had smaller 1986 crops, global production is forecast at 506 million tons, the second largest on record. China will remain the largest producer. Offsetting the large supplies is the prospect that use will reach a record 506 million tons, leaving global stocks about equal to 1985/86's record high. World trade is expected to rise, mainly reflecting larger imports by the Soviet Union.

Wheat Supplies Remain Large; Prices Weak

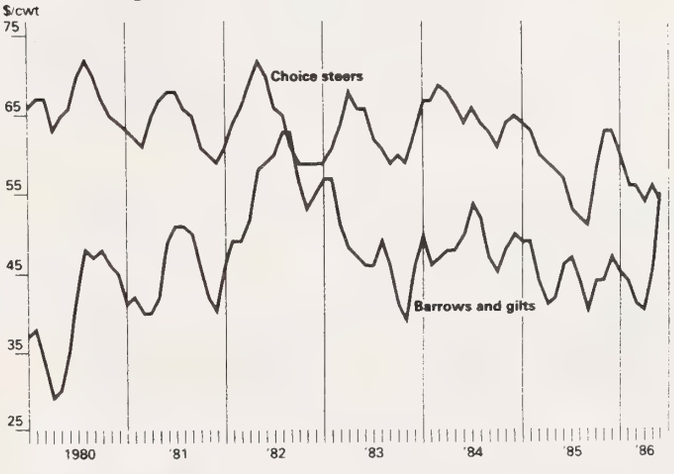


LIVESTOCK and POULTRY SITUATION

Since 1982, when livestock producers began reducing their inventories, large meat supplies have encountered weak demand stemming from sluggish economic growth, constrained consumer purchasing power, and favorable retail prices for poultry relative to red meats. No significant change in the situation is likely next year. Meat supplies are expected to remain almost record large as more poultry offsets less red meat, primarily beef. Relatively lower priced poultry will hold down price gains for red meats, particularly given the weak growth in many sectors of the economy.

Both beef and pork prices are expected to increase from the low levels of the past year. Prices for Choice beef at retail may increase during second-half 1986, but still average about $2.33 per pound for the year, the same as in 1985. Retail pork prices have already moved up from the $1.62 per pound average in 1985 and may be about $1.70 for 1986. In 1987, prices are likely to be near those of the early 1980s--about $2.40 for beef and $1.75 for pork. Poultry prices have advanced sharply, partially because of weather concerns, even as supplies increased. Sizable production gains through 1987 are expected to hold prices near 1986 levels.

Normal Hog-Steer Price Relationship Upset in June



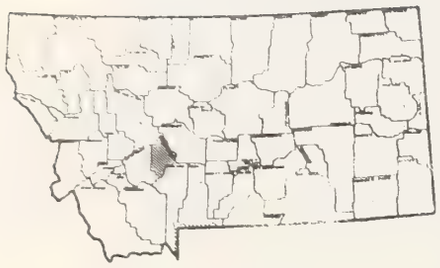
WHEAT FACTS

....Production from one cropland acre out of four goes overseas while production from two out of three wheat acres is exported.

....A modern combine can harvest 1,000 bushels per hour. Since one bushel of wheat yields 73 one pound loaves, this equates to 73,000 loaves per hour or 1,217 per minute.

....2.3 bushels of wheat yield 100 lbs. of flour and that much flour makes approximately 90 loaves of 22.5 ounce bread.

....90.3 percent of all wheat is harvested in 19 states.



*featuring.....*BROADWATER COUNTY

Broadwater County lies in central Montana. The Big Belt Mountains and the Helena National Forest run along the eastern border, and another part of the Helena National Forest lies along the western boundary. The Missouri River and Canyon Ferry Lake reach from the southern to the northern borders of the county. Aside from the mountainous landscape, the terrain is chiefly rolling foothills.

Cropland in Broadwater County includes both irrigated and non-irrigated acres, and a variety of crops abound. Barley, winter and spring wheat, oats, hay, and potatoes are all produced in the county. Cash receipts from the sale of crops totaled $6,938,000 in 1984.

Sheep, hog, and cattle operations can all be found in the county. In the January 1, 1985 sheep and cattle inventories Broadwater County ranked 34th and 39th, respectively. In the December 1, 1984 hog count the county came in 37th. Livestock contributed $7,785,000 in cash receipts in 1984. Government payments added $3,423,000 for a cash receipt total of $18,146,000 for Broadwater County in 1984.

WHEAT CROP EXPECTED TO BE UP
PASTURE & RANGE CONDITION GOOD
FARM PRICES STEADY
featuring.....DEER LODGE COUNTY

PASTURE & RANGE CONDITION

Pasture and range condition in Montana on September 1st was 76 percent of normal, down 10 points from a month ago, but the highest September 1 condition reported since 1982. Grasshoppers and localized drouth have impacted many pastures and ranges both east and west of the Divide. Other areas show the effect of sufficient rain and little insect damage. The southwest reports pasture and range condition much above normal. Overall, grasslands and stockwater are generally good.

MONTANA PASTURE & RANGE CONDITION SEPT. 1

By District as a Percent of Normal

DISTRICT	1984	1985	1986
Northwest	78	59	77
North Central	28	38	82
Northeast	24	25	70
Central	51	45	83
Southwest	88	52	90
South Central	62	42	73
Southeast	59	41	59
STATE	54	43	76

WHEAT PRODUCTION HIGHER

Montana's 1986 wheat crop is expected to total 145.7 million bushels as of September 1, up 2 percent from the August 1 forecast. This year's crop is nearly 3 times last year's production and the best crop since 1982. The all wheat yield at 29.8 bushels per acre is 0.6 of a bushel above August 1 and 17.1 bushels more than a year ago based on farmer reports as of September 1.

Winter wheat production, at 68.0 million bushels, is more than 3 times last year's level. Yield is expected to be 34 bushels per acre. Hard spring wheat, at 74.0 million, is also 3 times last year's output. Yield per acre at 27 bushels is up 1 since August 1. Durum production, at 3.7 million, is about 2.5 times last year. The yield at 25 bushels is unchanged from last month.

Montana's huge barley crop, a record 92 million bushels, is unchanged from a month ago. Yield is forecast at 40 bushels, twice the level of last year.

Oats production at 8.2 million bushels is up 9 percent from the month earlier forecast. Yield at 50 bushels is up 4 from last month.

All hay production remains at the August 1 forecast level--4.3 million tons, about 56 percent more than last year.

Sugarbeet production at 966 thousand tons is up 3 percent from August 1 and is 19 percent above a year ago. Yield on September 1 is estimated to be 20.5 tons per acre.

AUGUST FARM PRICES

The August index of prices received for all farm products by Montana farmers and ranchers showed no change from July, but was down 11 points from a year ago. The August index was 125 percent of its January-December 1977 average.

The August index for all crops was down 10 points from the previous month and down 31 points from August 1985. The livestock and products index was up 9 points from July and up 6 points from last year at this time. All crop items except oats and hay registered declines from the previous month and were considerably below last year's levels. All livestock prices except for lambs were up from July and except for calves and lambs were up considerably from last year at this time.

Nationally, the August all farm products index of prices received by farmers, at 125 percent of its January-December 1977 average, was unchanged from July. Cattle, hog, broiler, and egg prices moved higher while corn, cotton, potato and soybean prices were lower. The index was 4 points above a year earlier.

In August, hog and broiler prices were at record highs. The previous record high for all hogs of $61.30 was recorded in September of 1982 while the previous record for broilers was set last month. The August corn price of $1.70 per bushel was the lowest level since October 1977.

*featuring.....*DEER LODGE COUNTY

Deer Lodge County is located in western Montana and occupies approximately 473,734 acres. Most of the terrain is mountainous, being covered by parts of the Deer Lodge, and Beaverhead National Forests. A section of the Anaconda-Pintlar Wilderness lies along the western boundary. The Continental Divide makes up a portion of the eastern border of Deer Lodge County, cuts through the center, and runs along most of the western boundary. The Big Hole River defines the county's border to the south.

Because of the mountainous landscape, Deer Lodge County is, understandably not a large agricultural area. Inspite of this, spring wheat, barley, oats, and hay, as well as some potatoes are all grown in the county. The major part of the cropland is irrigated. Cash receipts for crops in 1984 totaled $160,000.

Livestock interests include cattle, sheep, and hog raising. Receipts from the sale of livestock and livestock products came to $3,048,000 in 1984. Total cash receipts for Deer Lodge County in 1984 amounted to $3,208,000.

REGIONAL PATTERNS OF WHEAT PRODUCTION

The Plains States are expected to produce 63 percent of the Nation's wheat crop this year, although production for the region is down 9 percent. Increased production in Montana and South Dakota did not offset decreases in the other states.

The Corn Belt States have about 14 percent of the total national production compared with 15 percent last year. This region has the largest percentage decrease in wheat production for 1986.

The Southern States will produce 5 percent of the Nation's total wheat, about the same as last year.

PRELIMINARY OUTLOOK FOR THE 1986/87 SEASON: SMALLER U.S. PRODUCTION AND A PICKUP IN EXPORT VOLUME, BUT LOWER FARM PRICES

JULY LIVESTOCK SLAUGHTER

Cattle and calves on feed August 1, 1986 for slaughter market in the 7 States preparing monthly estimates totaled 6.32 million head, down 1 percent from a year ago and 7 percent below August 1, 1984.

MARKETINGS of fed cattle during July totaled 1.68 million, an increase of 1 percent from last year, 8 percent above July 1984 and the highest July total since 7 State estimates were begun in 1972.

PLACEMENTS of cattle and calves on feed in the 7 States were 1.54 million, an increase of 43 percent from July 1985, 17 percent above two years ago and the highest July placements since 1978. **NET PLACEMENTS** of 1.48 million were up 46 percent from 1985 and 19 percent from 1984.

OTHER DISAPPEARAHCE totaled 64 thousand head compared with 61 thousand during July 1985 and 84 thousand two years ago.

CATTLE ON FEED IN 7 STATES DOWN

Montana slaughter plants produced 1.8 million pounds of red meat during July. This production was 17 percent more than the previous month but 9 percent less than the July 1985 production.

Cattle slaughter at 2,600 head was unchanged from last year, but lighter slaughter weights resulted in 8 percent less meat production. Hog slaughter at 2,400 head was down 8 percent.

Nationally, commercial red meat production in July 1986 totaled 3.28 billion pounds, up fractionally from July 1985, to a new July record high. January-July red meat production, at 22.9 billion pounds, was up 1 percent from the corresponding period last year. The percentage changes in accumulated production by individual components were: beef, up 4; veal, up 8; pork, down 4; lamb and mutton, down 5. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

NUMBER OF HIRED WORKERS DOWN, WAGES HIGHER

There were 3.5 million people working on the Nation's farms and ranches during the week of July 6-12, 1986. The work force was comprised of 2.0 million self-employed farm operators and other unpaid workers, 1.2 million workers hired directly by the farm operator and nearly 0.3 million agricultural services employees working on farms and ranches. The number of hired workers was down 10 percent (140,000) from July 1985.

The wage rate received by workers hired directly by farm operators was $4.57 per hour, 33 cents above July last year. Workers paid on an hourly basis averaged $4.46 compared with $4.18 in July 1985. Field workers received an average of $4.39, up 32 cents from the July 1985 week. Livestock workers earned an average wage of $4.15 per hour compared with $3.97 a year earlier.

During the July 6-12, 1986 survey week, self-employed farm operators worked an average of 47.3 hours, 2.3 hours less than in the comparable week in 1985. Unpaid workers, who worked 15 hours or more during the week, averaged 39.1 hours compared with 40.0 hours a year earlier. Hired workers put in an average of 37.0 hours, down 0.6 hour from July of last year.

Perquisites such as meals, housing, or motor vehicles in addition to cash wages were provided to 47 percent of the hired workers during the July 1986 survey week. Data from the 1985 Farm Production Expenditure Survey showed that the value of perquisites, including insurance and retirement benefits, housing, and other noncash benefits represented 16 percent of the farm and ranch labor expenditures.

featuring..... STILLWATER COUNTY

The boundaries of Stillwater county encompass approximately 1,147,520 acres of land in south central Montana. The Yellowstone river crosses the center of the county from west to east. The Stillwater River enters in the south and joins the Yellowstone River near Columbus, Montana. Parts of the Gallatin National Forest and Absaroka-Beartooth Wilderness blanket the southern tip of Stillwater county. The second highest peak in the state, Mt. Wood with an elevation of 12,661 feet is located in this area. Big game and waterfowl hunting, as well as fishing are all enjoyed in the county.

Cropland is largely non-irrigated. Spring and winter wheat, barley, oats, hay corn, sugarbeets, and dry beans are all produced in the county. Normally there are about 600 to 1,000 acres of sugarbeets grown in the county. However, sugarbeets were not grown during 1984 as no acreage was contracted. Production of winter wheat in 1984 put the county in 15th place, while production of hay and barley ranked the county 17th and 22nd, respectively, in 1984 crop production.

Hogs, sheep, and cattle are all raised in the county. Cash receipts from the sale of livestock and livestock products amounted to $19,758,000 in 1984. Crops receipts totaled $6,616,000, and government payments added $2,798,000. This made for a total of $29,172,000 in 1984 cash receipts for Stillwater County.

HIGHEST WHEAT CROP SINCE '82

BARLEY HITS NEW RECORD

Montana's 1986 wheat crop is expected to total 142.9 million bushels, up almost 3 times from a year ago and the largest crop since 1982. The yield at 29.2 bushels per acre is over twice last year's yield and is based on farmer reports as of August 1.

Winter wheat production, estimated at 68.0 million bushels, up over 3 times last year's crop. The yield is expected to be 34 bushels per acre compared with 16 a year ago.

Hard spring wheat production is 2.7 times last year's level with a yield of 26 bushels per acre, up 13 bushels from a year ago. Total production is forecast at 71.2 million bushels.

Durum production is expected to total 3.7 million bushels, about 2.5 times more than a year ago. This year's durum yield is forecast at 25 bushels compared with only 9 a year ago.

Montana's barley crop is expected to reach a record 92 million bushels, slightly more than 3 times last year's production. Yield is forecast at 40 bushels compared with 20 a year ago.

Moisture supplies in much of Montana's grain growing areas have been adequate during the season. However, severe outbreaks of grasshoppers have damaged crops, especially in the eastern parts of the state.

NATIONAL CATTLE HERD DECLINES
RED MEAT PRODUCTION
FEWER CATTLE ON FEED
MT MILK PRODUCTION DROPS OFF
1986 MINK PELT PRODUCTION
featuring.....DAWSON COUNTY

CATTLE & CALF INVENTORY DOWN

The Nation's cattle herd on July 1, 1986 was down 4 percent from a year ago and 8 percent below two years ago. This is the lowest July 1 inventory since mid-year estimates were begun in 1973 and the fifth consecutive year of decline after only two years of expansion in the early 1980s.

Most individual inventory classes were two to four percentage points below last year's levels except milk replacement heifers were down 6 percent.

The 1986 calf crop is expected to total 40.1 million head, down 2 percent from last year and 6 percent below 1984. This would be the smallest calf crop since 1960.

CATTLE & CALVES: NUMBER BY CLASS and CALF CROP, UNITED STATES JULY 1, 1984-1986

CLASS	1984	1985	1986	1986 as % of '85

JUNE 1986 LIVESTOCK SLAUGHTER

Montana slaughter plants produced 1.6 million pounds of red meat during June, 8 percent less than the previous month and 10 percent less than June 1985. Cattle slaughter at 2,200 head was down 12 percent from last year. Hog slaughter at 2,300 head was unchanged from a year ago, but the total live weight of the hogs slaughtered was up slightly.

Nationally, commercial red meat production in June 1986 totaled 3.16 billion pounds, up 2 percent from June 1985. January-June red meat production, at 19.6 billion pounds, was up 1 percent from last year. The 1985 accumulated production changes by individual components were: beef, up 3 percent; veal, up 8 percent; pork, down 3 percent; lamb and mutton, down 5 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

CATTLE ON FEED DOWN

Cattle and calves on feed July 1, 1986 for slaughter market in the 13 quarterly states totaled 7.95 million head, down 8 percent from July 1 last year and 9 percent less than two years ago. On feed numbers were the lowest for this date since 1975.

The cattle on feed inventory included 4.91 million steers and steer calves, down 7 percent from a year ago and 11 percent below 1984. This group represented 62 percent of the total July 1 number on feed compared with 61 percent in 1985. Heifers and heifer calves, at 3.01 million, were down 11 percent from last year and 5 percent from 1984.

Placements of cattle and calves on feed during the April-June quarter totaled 5.18 million, down slightly from last year, 7 percent below 1984 and lowest for this comparable period since 1975. Other disappearance of 375 thousand head leaves net placements at 4.81 million.

Marketings of fed cattle for slaughter during April-June totaled 5.77 million, down slightly from the same quarter last year, but 3 percent above 1984.

MILK PRODUCTION DOWN

Montana's April-June milk production at 87 million pounds was 3 percent below last year. Average production per cow at 3,225 pounds was slightly more than the same quarter last year.

Nationally, milk production in the second quarter of 1986 was 38.5 billion pounds, 3 percent above the same period last year. Production per cow at 3,520 pounds was 3 percent above the previous year.

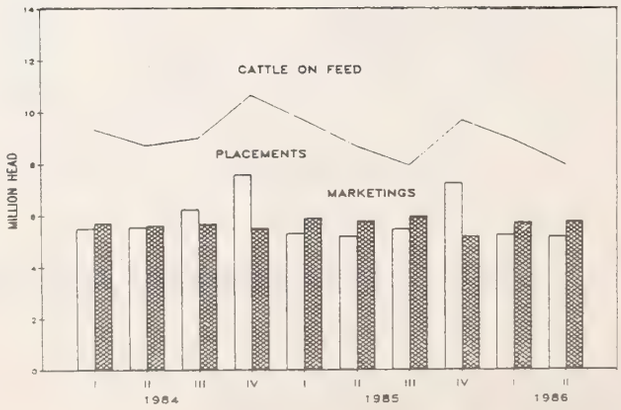
CATTLE ON FEED, PLACEMENTS, MARKETINGS
BY QUARTERS FOR 13 STATES



MONTANA WHEAT VARIETIES 1986

Redwin remains the most popular winter wheat variety. It was planted on 556,000 acres of the state's 1986 winter wheat acreage. Winalta retained its second position and Norstar is again in third place.

Newana continued to be the number one spring wheat variety. Fortuna moved into second place this year from 1984, the last time a variety survey was done, and Len dropped to the third most popular spring wheat variety.

Vic still remains the most popular durum variety grown in the state. Ward was second followed by Lloyd.

The wheat variety survey was made possible by funds provided by the Montana Wheat Research and Marketing Committee.

A complete, more detailed report on wheat varieties can be obtained by requesting one from our office.

MINK

Mink pelt production in the United States in 1985 totaled 4.17 million pelts, down 1 percent from 1984. Wisconsin, the major mink state, produced 1.18 million pelts.

By color class, the number of pelts as a percent of the total U.S. production was: Standard - 38.1 percent; Demi-Buff - 19.2 percent; Ranch Wild - 11.7 percent; Pastel - 8.0 percent; Pearl - 4.0 percent; and Violet - 4.9 percent. The remaining color classes accounted for 14.1 percent.

Mink pelts sold during the 1985 crop year were valued at 126.3 million dollars, down 3 percent from 1984. The average price per pelt for the 1985 crop year was $30.30, compared with an average price of $30.80 in 1984 and $29.90 in 1983.

Female mink bred to produce kits in 1986 totaled 1.07 million, down 4 percent from 1985. Females bred for the two major color classes are: Standard - 486 thousand and Demi-Buff - 155 thousand. Females bred in the leading states are: Wisconsin - 291 thousand; Minnesota - 146 thousand; and Utah - 144 thousand.

There were 1,042 mink farms producing pelts in 1985 compared with 1,084 the previous year. Leading states were Wisconsin with 235 farms, Minnesota with 160 farms, and Utah with 132. Fourteen percent of the mink farms raised fox, the same percentage as last year.

featuring. . . . . . DAWSON COUNTY

Dawson County occupies approximately 1,519,379 acres of land in east central Montana. The Yellowstone River flows through the southern half of the county. The land immediately adjacent to the river and its tributaries is hilly and broken, while a portion of the Big Sheep Mountain range is situated in the northwestern section.

Most of the acres for harvest in the county are non irrigated. Crop production provides the largest share of cash receipts from the sale of agricultural products. The county ranked 12th for spring wheat, durum and oats production in 1984, as well as coming in 14th and 18th for winter wheat and barley, respectively, for the same year. Corn, sugarbeets, and dry beans are also produced here.

Cattle, sheep and hogs are also raised in Dawson County. The January 1,1984 livestock inventories shows the county ranking 30th and 38th in cattle and sheep numbers, respectively. Hog numbers for December 1983 put the county 41st among the hog producing counties.

Cash receipts from the sale of crops totaled $10,752,000, and livestock receipts came to $9,223,000. Government payments added $6,034,000 for a total of $34,786,000 in cash receipts for Dawson County in 1984.

PASTURE & RANGE CONDITION

Montana's pastures and ranges are in mostly excellent condition and producing ample feed for livestock. Some producers were having a difficult time finding stock to utilize all the good grazing. Warm days and timely rains have helped grasses to develop to near full potential. The present condition of 92 is the highest July 1 condition since 1982, and a complete turnaround from last year at this time when condition was reported at only 46 percent of normal.

STATE	72	46	92

JULY 1 WINTER WHEAT PRODUCTION FORECAST

Montana's winter wheat crop for 1986 is forecast at 68.0 million bushels. Good growing weather plus timely rains during June have improved crop prospects for producers across the state. The July 1 forecast is 3 percent higher than the June 1 forecast and over 3 times larger than last year's drought stricken crop. Acreage for harvest at 2.0 million is up 43 percent from last year. The July 1 yield forecast at 34.0 bushels per acre compares with 16.0 bushels last year and 27.0 bushels two years ago.

Nationally, winter wheat production is forecast at 1.55 billion bushels as of July 1, 15 percent less than 1985 and the smallest crop in eight years. Yields are expected to average 36.0 bushels per acre, 2.1 bushels under 1985 yields and 0.8 of a bushel less than the June 1 forecast. Harvested acreage is placed at 43.2 million acres, down 10 percent from last year.

SWEET CHERRIES

Poor pollination due to cold weather which inhibited bee activity has greatly reduced cherry prospects. As of July 1, the state's cherry crop is forecast at 1,000 tons compared with 4,600 tons in 1985 and 2,300 tons in 1984.

PLANTED CROP ACRES

Montana producers planted fewer acres to hard red spring wheat and durum, but more acres to barley, oats and sugarbeets.

Total wheat acreage for harvest at 4.9 million acres is up 25 percent from 1985. A breakdown by classes indicates winter wheat for harvest at 2.0 million acres, up 43 percent; hard red spring wheat 2.8 million, up 16 percent; and durum at 147,000 is down 8 percent. Barley acreage for harvest is forecast at 2.3 million acres, up 53 percent from 1985. Acres of oats for harvest as grain at 163,000 are up over two times last year's acreage. All hay acres for harvest at 2.25 million acres are up 15 percent.

The first production forecast for spring planted crops will be released August 12.

MONTANA BARLEY VARIETIES

Hector, for the fifth year, remained the most popular barley variety grown in Montana, according to a June survey of growers. Hector, a feed variety, was planted on 33.9 percent of the total barley acreage. **Piroline,** a malting variety, remained the second most popular variety this year. This variety moved into the number one spot in 1970 and held that position until 1982. It then dropped to second place and has held that position up to the present time. **Clark and Klages,** both malting varieties, remained in third and fourth place, respectively. These top four varieties accounted for about 81 percent of the total barley acreage planted this year.

A complete, more detailed report on barley varieties can be obtained by requesting one from our office.

WEATHER-CROP SITUATION

(For Week Ending June 22, 1986)

Topsoil moisture was generally adequate in the major crop producing areas of the state. However, some shortages were beginning to develop especially in the southwestern part of the state.

Crops grew well in most areas and farmers and ranchers made good progress with summerfallowing, spraying and haying. Concern over grasshopper damage was increasing, especially in most eastern areas of the state. About 60 percent of the winter wheat was headed compared with 70 percent last year and the five year average of 60 percent. Only about 5 percent of the spring wheat was headed compared with 20 percent last year and the average of 10 percent. Sugarbeets are 80 percent thinned, the same as last year, but 10 percent ahead of average. First cutting of alfalfa hay is 25 percent complete, last year 35 percent had been cut and normally 15 percent is cut by this time. Wild hay harvest is ahead of normal and last year.

Pastures and ranges are in much better shape than they were last year at this time. Current grazing conditions for pastures and ranges are reported as 87 percent adequate and 13 percent surplus.

U.S. JUNE HOG & PIG INVENTORY

Inventory of all hogs and pigs in the U.S. on June 1, 1986 is estimated at 48.8 million head. This is 7 percent below a year ago and 8 percent below June 1, 1984. This is the lowest June 1 inventory since 1975.

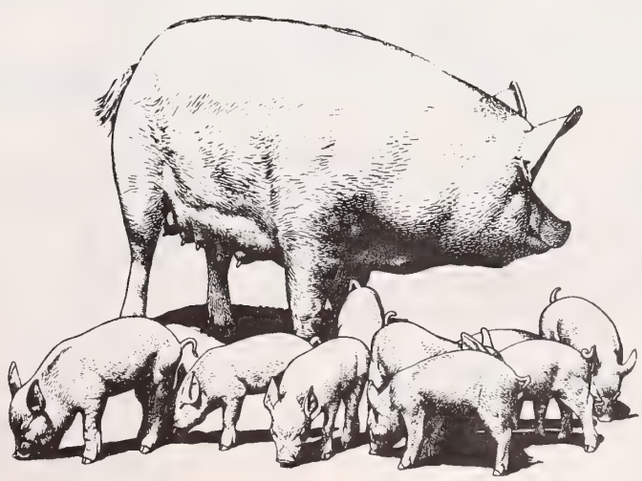
Breeding inventory, at 6.39 million head, is 9 percent below last year and 14 percent below two years ago. This is the lowest June 1 breeding inventory since the establishment of June 1 U.S. inventory estimates in 1964.

Market hog inventory, at 42.5 million head, is 6 percent below a year ago and 7 percent below two years ago.

The December 1985 - May 1986 U.S. **pig crop** was 41.1 million head, 3 percent below last year and two years ago.

Sows farrowing during this 6 month period, at 5.31 million, were 5 percent less than the previous year and 7 percent below two years ago. Pigs saved per litter was a record high 7.73 and compares with 7.64 last year and 7.45 two years ago.

U.S. hog producers **intend to farrow** 5.16 million sows during the June-November period, a decrease of 9 percent from the same period in 1985 and 12 percent below two years ago.



FARMLAND VALUES: WHERE'S THE BOTTOM

The downward trend in farmland values continued during the past year as 37 states registered declines. In 21 states, values dropped more than 10 percent, while increases were recorded in 11 mainly northeastern states.

For the nation as a whole, average farm real estate values per acre dropped about 12 percent, according to economist William Heneberry of USDA's Economic Research Service. "That makes 2 consecutive years with 12-percent delines," he says. Heneberry's latest look at farm real estate values--including both land and buildings--covers 10 months, from April 1, 1985 to February 1, 1986. Last year's report covered the 12 months ending on April 1, 1985.

These figures are all based on average values, he explains, so they do mask the wide differences between locations and types of land. Hilly, rocky, or semi-arid grazing land, for example, is averaged with highly productive, high-priced cropland near urban centers.

Nevertheless, the relatively large declines in the latest data suggest that farmland values have not yet bottomed out in many parts of the country. "We expect to see fewer states with minuses and generally smaller declines during the rest of this year, but a sudden turnaround doesn't seem likely given the recent numbers," Heneberry says.

"All the problems clearly haven't disappeared," he adds. "There are still too many acres available relative to the demand, and some lenders are understandably cautious about financing land purchases. Some buyers may be waiting for prices to drop even further, while a number of farmers who might be potential buyers are still trying to deal with their current debt load."

In addition, some of the factors that influence buyers, including the outlook for commodity prices, exports, and farm income, are not very encouraging this year. Finally, the longer term prospect of smaller government support payments to agriculture (when scheduled target price reductions take effect) may be adding an element of uncertainty and risk for the years ahead.

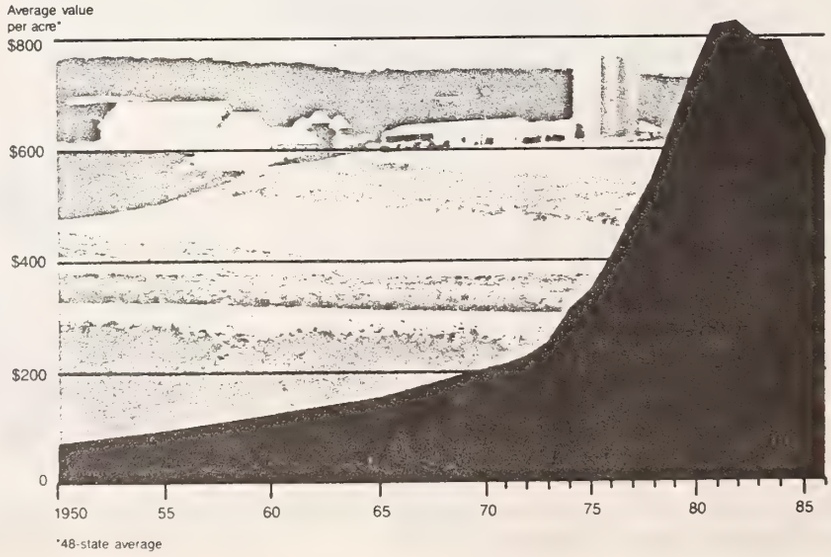
Along with these general observations, Heneberry maintains that regional and sectoral problems have played a role in some land value declines. In the Texas High Plains, for example, concerns about declining water tables and the future availability of water have affected prices for irrigated cropland. Depressed conditions in the beef cattle sector have weakened the market for pasture and grazing land, especially in parts of the Corn Belt, Northern Plains, and Mountain States.

Of course, he can also point to developments that, by themselves, would tend to attract investors and strengthen land prices. Lower interest rates and oil prices, for example, will help reduce costs of production, making it somewhat easier to turn a profit from a piece of farmland.

Farm Real Estate Values Decline in 37 States and Rise in 11 Others

Percent change between April 1985 and February 1986

After Climbing from $200 in 1970 to More Than $800 an Acre in 1982, Farm Real Estate Values Have Dropped Nearly 30%



*48-state average

LIVESTOCK SLAUGHTER

Montana slaughter plants produced 1.7 million pounds of red meat during May, 10 percent more than the previous month but 12 percent less than the May 1985 production.

Cattle slaughter at 2,300 head was down 15 percent from last year. Hog slaughter at 2,400 head was 4 percent below a year ago.

Nationally, commercial red meat production in May 1986 totaled 3.39 billion pounds, down 3 percent from May 1985. January-May red meat production, at 16.4 billion pounds, was up 1 percent from last year. The percentage changes in accumulated production by individual components were: Beef, up 3; Veal, up 8; Pork, down 3; Lamb and Mutton, down 6. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

EGG PRODUCTION

Montana poultrymen produced 52 million eggs in the March-May quarter--6 percent more than in the preceding quarter and 2 percent more than in the same period a year ago.

The average number of layers in the flocks during the quarter was 800,000, about 2 percent more than the previous quarter but slightly less than a year ago.

The nation's laying flock increased 1 percent in size compared with last year and egg production was also up 1 percent.

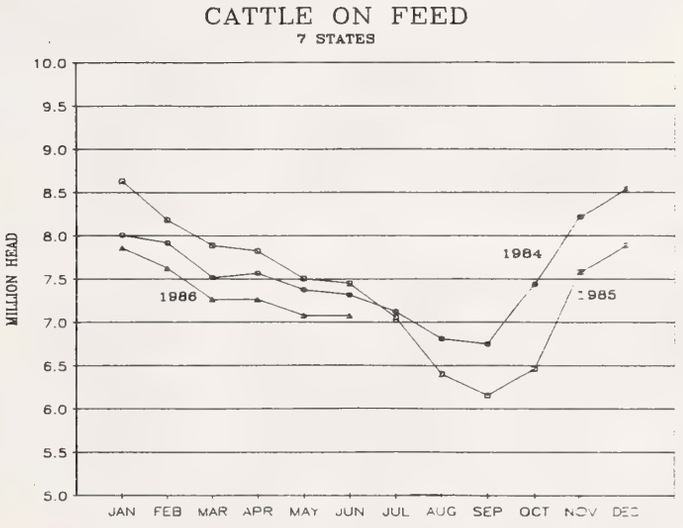
CATTLE ON FEED IN 7 STATES DOWN

Cattle and calves on feed June 1, 1986 for slaughter market in the 7 States preparing monthly estimates totaled 7.08 million head, down 5 percent from a year ago and 3 percent below June 1, 1984.

MARKETINGS of fed cattle during May totaled 1.62 million, an increase of 1 percent from last year but 1 percent below May 1984.

PLACEMENTS of cattle and calves on feed in the 7 States were 1.75 million, an increase of 4 percent from May 1985 but 3 percent below two years ago. **NET PLACEMENTS** of 1.61 million were up 4 percent from 1985 and 2 percent from 1984.

OTHER DISAPPEARANCE totaled 132 thousand head compared with 128 thousand during May 1985 and 219 thousand two years ago.



TOP EXPORT STATES

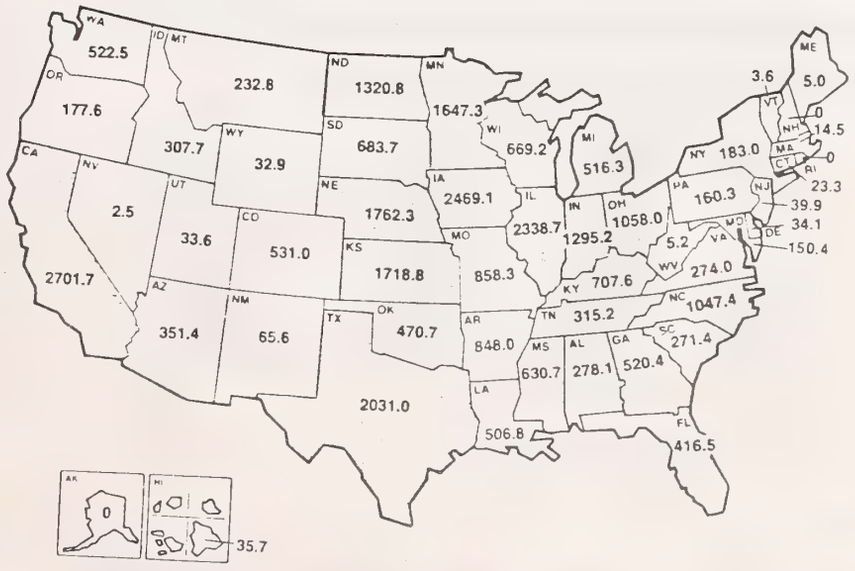
California emerged as the leading farm export state last year, according to analysts of USDA's Economic Research Service. "For the first time since we started producing these statistics in 1964, California was number one," says ERS economist Steve Milmoe.

It wasn't any surge in sales that steered the nation's most populous state ahead of Iowa and Illinois, the traditional leaders for the last several years. Rather, California simply lost less (in its export values) than the two Midwestern states. In fiscal year 1985, California exported some $2.7 billion worth of farm goods, a drop of $87 million from fiscal 1984.

Iowa's export sales, on the other hand, plunged more than $800 million from fiscal 1984 to fiscal 1985. And the value of Illinois' farm exports fell nearly $600 million in the same period. Iowa led the list of exporting states in fiscal years 1981, 1982 and 1984. Illinois was the top export state in fiscal 1983.

With Major Declines in Export Sales of Iowa and Illinois, California Was Top Export State in Fiscal 1985

Fiscal 1985 export sales, in $ millions



featuring. . . . . YELLOWSTONE COUNTY

Located in south central Montana, Yellowstone County is bisected lengthwise by the northeasterly flowing Yellowstone River. The Yellowstone Valley extends through the county, flanked by benchlands. The Crow Indian Reservation reachs into the southeastern corner. Billings, the largest city in the state, is located here making the county foremost commercially and industrially in southeastern Montana.

Most of the soil in the area is tillable, with the balance mostly suitable to grazing. There were almost twice as many non-irrigated than irrigated acres harvested in 1984. But the combination of non-irrigated and irrigated land affords opportunities for all types of farming and stock raising.

The variety of crops produced in Yellowstone County in 1984 includes winter and spring wheat, barley, oats, hay, sugarbeets, dry beans, and corn. The county ranked 9th in both winter wheat and hay production in 1984, 10th in barley, 14th in oats, 27th in spring wheat production, and was the largest corn producer.

Cattle raising is a major industry in the county as it ranked 5th in the state in the January 1, 1984 cattle inventory. Sheep, hog and chicken raising are also included in the agricultural picture.

Total cash receipts for Yellowstone County in 1983 were $77,178,000, the second largest total in the state. $44,334,000 of that total came from livestock, while crops contributed $28,220,000. Government payments made up the remaining $4,624,000.

PROSPECTS IMPROVE FOR MONTANA'S WINTER WHEAT CROP

June 1 conditions indicate a Montana winter wheat crop almost three times larger than last year's drought stricken crop. Very little winterkill was reported due to the good stands established last fall before going into the winter. With cool, damp weather during most of May and record high temperatures the last week of the month, yield prospects are very good. The yield, forecast at 33 bushels per acre, is up a bushel from last month, but acreage for harvest remained unchanged.

The nation's winter wheat crop is expected to be 14 percent less than last year. The Plains States, accounting for 58 percent of the U.S. production, are down 16 percent. Both Kansas and Texas are showing huge drops in production. Production in the three Pacific Northwest states is up 4 percent but the Corn Belt States are down 18 percent. The Southern States with only 6 percent of the U.S. production are down 22 percent.

[1]Retail weight basis. [2]Per capita sales.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants manufactured 152,000 gallons of ice cream in April, 11 percent less than in the same month last year. Creamed cottage cheese production at 334,000 pounds was 12 percent less than a year ago. Butter output was up 5 percent at 159,000 pounds. American cheese production at 311,000 pounds was 2 percent less than the same month last year.

CHERRY PRODUCTION

Montana's sweet cherry crop is forecast at 1,800 tons, 61 percent less than last year. Pollination was very poor due to frequent frosts and cold and windy weather during bloom. The average date of bloom was May 7.

Sweet cherry production in the six western states is expected to total 112,700 tons, 13 percent more than last year, but down 23 percent from 1984.

PASTURE & RANGE CONDITION

Montana's pasture and range condition on June 1 at 90 percent of normal was the highest June 1 condition since 1978. The good condition is the result of ample moisture received last fall and this spring. Grass growth has generally been slow due to cool weather, but record high temperatures the last week of May accellerated growth and provided generally good grazing.

MONTANA PASTURE & RANGE CONDITION--JUNE 1
by District as a Percent of Normal

MAY FARM PRICES

The May 1986 Index of Prices Received by Montana farmers and ranchers was unchanged from the previous month. The May index at 141 percent of its January-December 1977 average was 5 points below last year.

May prices were down from April for winter wheat, barley, hay, steers and heifers, milk, eggs and wool. Prices increased for durum wheat, other spring wheat, oats, cows, calves, sheep, lambs and hogs.

Nationally, the May index of prices received by farmers for all farm products increased 3 points from April to 124 percent of its January-December 1977 average. Higher prices for hogs, lettuce, cattle, apples, corn, and oranges were partially offset by lower prices for wheat, upland cotton, sweet corn, milk and eggs. The index was 6 points below a year ago.

Beef cattle and hog prices moved higher in May after declining since December 1985. Increases in hog prices accounted for about two thirds of the relatively sharp increase in the meat animal index. The April 1986 all wheat price was the highest since April 1985. However, the May preliminary all wheat price declined 20 cents per bushel from the previous month.

YARDSTICKS OF PERFORMANCE

Among the most important yardsticks of American agriculture's performance are trends in production and efficiency. Here are some recently published measurements, updated to 1984, on how the farm sector has been doing:

Total U.S. farm output doubled between the early 1940's and the 1980's. Although 1984 production recovered from 1983's depressed level, it did not match the peaks of 1981 and 1982.

On average, each person working on a U.S. farm--including farm operators, family helpers, and hired workers--produced enough agricultural products for an estimated 77 people in 1984. That total includes 57 Americans and 20 people abroad. In 1960, the average U.S. farm worker produced enough to supply only around 26 people here and abroad.

featuring. . . . . MINERAL COUNTY

Mineral County is located on the extreme western edge of the state, next to the Idaho line. The Coeur d'Alene Mountains mark its northern boundary, and the Bitterroot Range its western boundary. The Lolo National Forest covers almost the entire county. The Clark Fork River enters the county from the south. Near St. Regis, the river bends to the east and continues on out of Mineral County. The St. Regis River begins on the western border and joins the Clark Fork River at its bend near St. Regis.

The 1982 Census of Agriculture lists Mineral County's farm land at 17,886 acres. This is the smallest farm acreage of any Montana County, and accounts for only 2.3 percent of the total land area in the county. However, winter wheat, barley, oats, hay and corn were all produced in the county according to the 1984 crop production figures. Although the numbers are limited, some cattle, sheep and hogs are also raised in the county.

Total cash receipts for Mineral County amounted to $668,000 in 1983. $366,000 of this total came from livestock, while crops made up the remaining $302,000. There were no government payments in the county in 1983.

Superior is the county seat. The area has an annual average precipitation of 17.46 inches.

MONTANA WHEAT CROP RATED GOOD TO EXCELLENT

This week's crop-weather report shows cool, wet, windy weather prevailed. Only two days were suitable for fieldwork last week, but planting remained at about normal for this date. About 80 to 85 percent of the small grains are now planted. Germination and growth is ahead of average. Winter and spring wheat condition is rated 75 percent good to excellent. This year's first winter wheat forecast pegged this year's crop at 64 million bushels--nearly triple last year's drought stricken crop. Based on May 1st conditions, yields are expected to average 32 bushels per acre--the best since 1983.

Both topsoil and subsoil moisture are over 95 percent adequate to surplus--so we're still in good shape in that respect. Precipitation since April 1st is above normal in nearly all of the major agricultural areas. Those traveling across the State say it looks green and beautiful Statewide--certainly good news compared with the last couple of years.

A look at the livestock situation shows 50 to 60 percent of the cattle and sheep have been moved to summer ranges. Pastures seem to have plenty of moisture but growth has been slowed by cool temperatures.

FARM PROGRAM PARTICIPATION HIGH

Montana producers had a high level of participation in this year's farm programs. According to results released by the Agriculture Stabilization and Conservation Service (ASCS), 92 percent of Montana's wheat base acreage was enrolled this year. This ranked Montana second in participation behind North Dakota. Abcut 82 percent of Montana's wheat farmers signed up.

Participation in this year's barley program was also high as 79 percent of the barley acreage was enrolled. Sixth-three percent of the barley producers participated.

NUMBER OF WORKERS DOWN FROM 1985--WAGES UP

During the week of April 6-12, 1986, there were 2.9 million people working on farms and ranches in the United States. This included 910,000 workers hired directly by farm operators and 184,000 agricultural service employees working on farms. The count of workers was down 4.4 percent (135,000) from April 1985 and 7.7 percent (241,000) below October 1985. Unpaid workers who worked 15 hours or more and self-employed farm operators accounted for the remaining 1.8 million workers, 5.5 percent (106,000) below April 1985 and 6.9 percent (133,000) below October 1985.

The wage rate for all workers hired directly by farm operators was $4.71 per hour, 20 cents above April last year. Workers paid on an hourly basis averaged $4.52, compared with $4.36 in April 1985. Wage rates for other categories of workers were (with April 1985 comparisons): Field $4.58 ($4.51); Livestock $4.26 ($3.91); and Piece-rate $6.18 ($5.61).

Self-employed farm operators worked an average of 43.6 hours during the survey week, 0.6 hour less than the comparable week in 1985. Other unpaid workers averaged 34.7 hours for the week, down 1.0 hour from last year. Hired workers averaged 38.8 hours, 1.3 hours fewer than last April.

Perquisites such as meals, housing or motor vehicles in addition to cash wages were provided to 46 percent of the April hired workers. Housing was furnished to 13 percent of the labor force. In April 1985, 47 percent of the workers received some type of perquisite.

CATTLE ON FEED IN 7 STATES DOWN

Cattle and calves on feed May 1, 1986 for slaughter market in the 7 States preparing monthly estimates totaled 7.08 million head, down 6 percent from a year ago and 4 percent below May 1, 1984.

MARKETINGS of fed cattle during April totaled 1.62 million, an increase of 1 percent from last year and 6 percent above April 1984.

PLACEMENTS of cattle and calves on feed in the 7 States were 1.56 million, an increase of 10 percent from April 1985 and up 3 percent from two years ago. **NET PLACEMENTS** of 1.44 million were up 12 percent from 1985 and 8 percent above 1984.

OTHER DISAPPEARANCE totaled 120 thousand compared with 133 thousand during April of 1985 and 194 thousand two years ago.

POTATO STOCKS

Montana potato stocks on hand May 1, 1986 totaled 50,000 cwt, down 67 percent from a year ago and amount to only 3 percent of production.

Nationally, May 1, 1986 potato stocks totaled an estimated 63.4 million cwt, up 21 percent from last year, but below the May 1 stocks created by the heavy 1978 potato production. Current stocks accounted for 19 percent of fall production this year compared with 17 percent remaining last year. April sorting losses and cullage continued high in Western States, running nearly 3 times as high as a year ago.

Western States storages held 42.5 million cwt of potatoes on May 1, 1986, up 12 percent from last year and 16 percent above 1984. Idaho stocks at 22.5 million cwt were even with last year, but April cullage continued high. Storage operators say about 6 percent of stocks on-hand will not be usable because of frost damage. Washington stocks of 9.7 million cwt were up 39 percent while Oregon holdings of 5.8 million cwt were 29 percent larger than a year ago. Colorado potato stocks totaled 4.7 million cwt, up 40 percent from last year. However, about one-fourth of these holdings are unmarketable under size restrictions and other sorting losses. California holdings at 750 thousand cwt are down 37 percent from last year while Montana's seed stocks are mostly gone.

Created in January of 1901, Powell County occupies approximately 1,490,758 acres of mostly mountainous terrain in western Montana. Parts of the Flathead, Lolo, Helena, and Deer Lodge National Forests provide beautiful scenery within the boundaries of the county. Powell County is traversed by sections of a number of rivers including the South Fork of the Flathead River, the Blackfoot, Little Blackfoot, and Clark Fork Rivers. Upsata Lake, Coopers Lake, Browns Lake and Nevada Lake are all located in the county also. The well known Grant-Kohrs National Historic Site is located in the southern part of the county.

While not a large agricultural center because of the vast areas of forest land, the county's agricultural industry is diversified. A variety of crops are produced including hay, for which the county ranked 7th in 1984 crop production oats, barley, spring wheat, winter wheat, and some potatoes. Livestock interests include the raising of cattle, for which the county ranked 23rd in the January 1, 1984 inventory, sheep and also hogs.

Cash receipts from the sale of livestock and livestock products brought in $10,528,000 in 1983, while crops contributed $2,329,000. Government payments in the county added $331,000 for cash receipt total of $13,188,000 for Powell County in 1983.

MFG. DAIRY OUTPUT
RED MEAT PRODUCTION DROPS
APRIL FARM PRICES DECLINE

WINTER WHEAT CROP PROMISING

Montana's production is expected to total 64 million bushels--almost triple last year's drought stricken crop. Good fall moisture at planting time plus a wet cool spring is developing a normal to above normal wheat crop. Winterkill was very light this year due to good stands established last fall before winter set in. This year's May 1 yield forecast at 32 bushels per acre compares with 16 in 1985, 27 in 1984 and 35 in 1983. Acres for harvest at 2.0 million acres are up 43 percent from last year's 1.4 million. In 1983 and 1984 harvest acreage was 2.3 and 2.5 million acres respectively.

AGENCY NAME CHANGE

The U.S. Department of Agriculture last week changed the name of its Statistical Reporting Service to the National Agricultural Statistics Service. The new name more accurately reflects the purpose of the agency and its broad agricultural focus. The agency's Crop Reporting Board was also renamed the Agricultural Statistics Board to closely align with the new agency name and to better describe the scope of the board's responsibility.

The Montana office will drop the Montana Crop and Livestock Reporting Service name and adopt a new name that more closely identifies it with the national office. The Montana office will now be called the Montana Agricultural Statistics Service. The new name more accurately reflects the wide range of statistical services the office provides. In addition to crop and livestock data, The office provides other information such as farm prices, labor, farm numbers, land in farms and farm finances. The office will continue to operate as a state-federal office under a cooperative agreement with the Montana Department of Agriculture.

WHEAT STOCKS DOWN

Wheat stored on Montana farms and in mills and elevators on April 1, 1986 totaled 82 million bushels, down 26 percent from a year ago. The April 1 stocks are the lowest amount on hand since 1975 when there were 65 million bushels of wheat stored in the state. The amount held in farm storages was also the lowest since 1975.

Winter wheat stored in the state at 50 million bushels was down 23 percent from April 1, 1985. All spring wheat at 32 million bushels was down 30 percent. The durum wheat portion at 5.3 million was 42 percent below last year.

Due to U.S.D.A. budget reductions for this year, January, April and October stocks estimates of barley and oats are discontinued. End-of-marketing year stocks for these two crops will be made for June 1 only.

(See tables on inside page.)

PASTURE & RANGE

Montana's overall pasture and range condition on May 1 had a pretty wide range. the poorest condition was reported in the northeastern part of the state. Grass growth has been slow this spring due to the cool weather. However, most pastures and ranges are green across the state which is much different than last year at this time. As of May 1, about 55 percent of the livestock in the state were still receiving some supplemental feed.

MARCH LIVESTOCK SLAUGHTER

Montana slaughter plants produced 1.4 million pounds of red meat in March 1986, 11 percent less than March 1985.

Cattle slaughter was 1,900 head, 10 percent less than last year. Hog slaughter at 2,400 head was unchanged from March a year ago.

Nationally red meat production during March was 3.13 billion pounds, down 1 percent from March 1985. Beef production at 1.86 billion pounds was virtually unchanged from the previous year. Veal production at 43.0 million pounds was up 8 percent and pork production at 1.20 billion pounds declined 3 percent. Lamb and mutton production at 32.0 million pounds was down 3 percent from March a year ago.

WINTER WHEAT PRODUCTION FORECAST
BY DISTRICTS -- MAY 1, 1986 1/

DISTRICT	WINTER WHEAT		
	1985	Ind. 1986	% Chg.
	----000 Bu.----		Pct.

SOUTHEAST	2,859	5,880	+106
STATE	22,400	64,000	+186

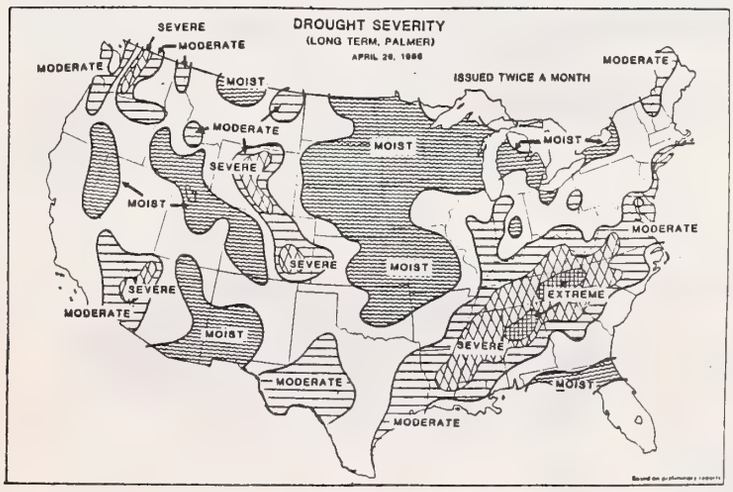
1/ District data funded by the Montana Wheat Commission.

HAY STOCKS

Hay stocks on Montana farms and ranches as of May 1 were 331,000 tons--the lowest for this date since 1962. The 10 year average for May 1 hay stocks on Montana farms and ranches is 892,000 tons. This year's low level was caused by drought during the last two growing seasons which cut yields and also reduced the acreage cut for hay.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 157,000 gallons of ice cream during March, 1 percent more than in March 1985. Creamed cottage cheese production at 326,000 pounds was 4 percent less than a year ago. Butter output at 165,000 pounds was up 2 percent. American cheese production at 283,000 pounds was up 48 percent from the same month a year ago.



APRIL FARM PRICES

The April 1986 Index of Prices Received by Montana farmers and ranchers was down 5 points from last month and 10 points below April 1985.

Prices received for wool were up from last month; durum wheat and hay were unchanged; all other items were down. Compared with last year's April prices, spring wheat, hay and wool were up, eggs were unchanged, all other items were down. Cow prices lead the decline with a $6.80 per hundredweight reduction from last year.

Nationally, the April Index of Prices Received by farmers for all farm products decreased 2 points from March to 120 percent of its January-December 1977 average. Lower prices for eggs, cattle, hogs, wheat, and milk were partially offset by higher prices for lettuce, potatoes, and tomatoes. The index was 12 points below a year ago.

The Index of Prices Paid by Farmers for Commodities and Services, Interest, Taxes, and Farm Wage Rates for April was 160 percent of its 1977 average. The index declined 3 points from February and was 4 points below a year earlier. Lower prices for fuels and energy, feeder livestock and seeds accounted for most of the decline. The fuels and energy index was the lowest since December 1979.

SURVEY RESULTS

MORE MILK PRODUCED IN MONTANA

Montana dairymen produced 84 million pounds of milk in the first quarter of 1986. This is 2 percent above the same period in 1985. The number of milk cows remained the same as last year at 28,000 head. Dairymen fed 14.5 pounds of grain and concentrates per cow, the same as last year.

Nationally, milk production in the January-March quarter totaled 36.2 billion pounds, up 7 percent from the comparable period in 1985. The total number of milk cows in the nation's herds averaged 11.1 million head in March, 3% above March 1985.

SURVEY RESULTS

MONTANA SHEEP & LAMB LOSSES DOWN

Montana sheepmen lost 127,000 sheep and lambs in 1985 to weather, predators, disease and other causes--29 percent less than in 1984. Weather related deaths were sharply lower than last year, but other causes were up.

The value of the loss came to $5.95 million. This is a 24 percent decrease from 1984. Predators claimed $2.5 million, non-predator factors $2.7 million, and unknown causes claimed $.8 million of the total loss.

Coyotes remain the major predator on the sheep and lamb population. A $1.99 million loss was attributed to coyotes.

Weather losses in 1985 were down considerably from 1984. Only 2,000 sheep and 12,100 lambs were lost to weather in 1985, as compared with 26,700 sheep and 46,100 lambs lost in 1984 to severe weather.

Total predator losses remained the same as the year before at 51,700. Coyotes accounted for a larger percentage of kills in 1985 at 80 percent, compared with 74 percent in 1984.

POTATO STOCKS

Montana potato stocks on hand April 1, 1986 totaled 1.10 million cwt, down 7 percent from a year ago and amount to 58 percent of production.

Nationally, April 1 potato stocks totaled an estimated 103 million cwt, up 19 percent from last year and 26 percent above two years ago. Cullage and sorting losses continue to run high in Western States, now reaching nearly two and one-half times last year's level. Stocks account for 30 percent of fall production this season compared with 28 percent a year earlier.

The Western States stored 68.9 million cwt of potatoes this month, up 14 percent from last year and 18 percent above two years ago. After heavy sorting, Idaho storages hold 35.0 million cwt, up barely 3 percent from last year. Farmers indicate about 7.5 percent of these potatoes have frost damage and will be unusable. Colorado stocks totaled 7.10 million cwt, up 31 percent from last year. Increased size standards, frost damage, and low prices will likely lead to abandonment of as much as one-fourth of remaining stocks. Washington with 16.2 million cwt and Oregon with 8.0 million cwt show gains of 43 percent and 25 percent, respectively, from year earlier stocks. California and Montana are below last year's storage level by 21 percent and 7 percent.

POULTRY RECEIPTS DOWN

Montana egg production in 1985 was valued at $8.6 million, 19 percent below last year inspite of a 2 percent increase in egg production. The average price was 51.0 cents per dozen, 20 percent less than the previous year.

Chickens sold in 1985, excluding broilers, brought producers $168,000. The average price received, mostly for spent laying hens, was 7 cents per pound.

Nationally, value of egg production in 1985 was $3.25 billion, down 21 percent from 1984. In 1985, eggs averaged 57.1 cents per dozen, compared with 72.3 cents in 1984.

featuring. . . . . GRANITE COUNTY

Granite County occupies approximately 1,106,681 acres of western Montana. Its terrain is largely mountainous, and comprised of sections of the Deer Lodge National Forest. The Continental Divide crosses its southeastern boundary, while the Sapphire Mountains define the western edge of the county. A section of the Anaconda-Pintlar Wilderness area lies along the southeastern border. The Clark Fork River crosses the northern section of Granite County, while Rock Creek traverses the entire length of the county in the west. Georgetown Lake, a popular fishing spot, lies along the southeastern border.

Approximately 30 percent of Granite County's acreage is in farms and most cropland is irrigated. Hay was the major crop harvested in the county in 1984, but barley, oats, and spring wheat are also produced here.

Livestock interests are also varied, with Granite County ranking 36th among the cattle producing counties in the January 1, 1984 inventory. The county also came in 47th in the January 1, 1984 sheep count, and 56th among the hog producing counties in the December 1, 1983 inventory.

Cash receipts from the sale of livestock brought in $8,858,000 in 1983. Crops receipts added $1,159,000, and government payments came to $72,000 for a cash receipt total of $10,089,000 in 1983.

SURVEY RESULTS

MONTANA WOOL PRODUCTION DOWN

Montana wool growers produced 5.1 million pounds of wool in 1985, 11 percent less than the previous year. The value of this year's wool clip dropped 34 percent as production declined and the average price per pound fell from 91 cents in 1984 to 67 cents in 1985. Value of the 1985 Montana wool clip was $3.4 million.

Montana ranked number 6 among all wool producing states, in terms of total wool production. However, Montana growers produced the second heaviest average fleece weight, out-ranked only by Nevada.

The U.S. average fleece weight was 7.83 pounds, while Montana averaged 9.9 pounds, and Nevada was 10.2.

WHEAT and BARLEY MOVEMENT

Montana **wheat** shipped to out-of-state destinations June-November 1985 was 34 percent below the same period last year. Rail movement amounted to 20.7 million bushels, down from the 31.1 million in 1984. Trucks carried 7.5 million bushels compared with 11.5 million the previous June-November period.

Shipments to western destinations (primarily export facilities of Washington and Oregon) were 38 percent below the previous period. Wheat movement to eastern destinations was up 69 percent. Shipments to other destinations were up 49 percent.

Montana **barley** shipped to out-of-state destinations June-November 1985 was 40 percent below the same period last year at 7.8 million bushels.

Movement to eastern destinations was 65 percent below the June-November 1984 volume. Movement west was down 15 percent and other destinations were 46 percent below the previous year.

WHEAT UTILIZATION

Montana wheat shipped to out-of-state destinations in the 1984 marketing year (June 1984-May 1985) is estimated at 91.2 million bushels. This is 87 percent of total disappearance. The amount shipped to the Pacific Northwest was 79.7 million bushels--39 percent less than in the 1983 marketing year.

Montana wheat milled for flour in the Pacific Northwest was down 4 percent. The amount exported to overseas destinations from the Pacific Northwest ports declined 45 percent from the previous year. Montana's share of total hard red wheat and durum exported from the Pacific ports dropped to 37%, the lowest since the 1973 marketing year.

MARCH FARM PRICES UP SLIGHTLY

The Index of Prices Received by Montana farmers and ranchers in March 1986 was up one point from the previous month at 147 percent of its January-December 1977 average.

Higher prices received for barley, hay, steers and heifers, calves, sheep, eggs, and wool more than offset lower prices for wheat, oats, cows, lambs, hogs, and milk. Compared with March last year the index is down 3 points. Most items are below last year, only spring wheat, barley, hay, sheep, eggs, and wool were above last year.

Nationally, the Index of Prices Received by Farmers for all farm products decreased 1 point from February to 121 percent of its 1977 average. The index is now 13 points below last year.

A 2 point drop in the Livestock and Livestock Products Index was partially offset by an increase in the poultry and egg index. The March All Crops Index was unchanged from a month earlier.

1/ Unadjusted for all farm products. 2/ For commodities and services, interest, taxes and wage rates. 3/ Prices Received Index divided by Prices Paid Index, ratio derived using the most recent Prices Paid Index. 4/ Ratio of Prices Received to Prices Paid using 1910-14 prices.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 128,000 gallons of ice cream during February--8 percent more than in February 1985. Creamed cottage cheese production at 305,000 pounds was 1 percent less than a year ago. Butter output at 168,000 pounds was down 7 percent. American cheese production at 268,000 pounds was 19 percent above the same month a year ago.

SPRING PLANTING INTENTIONS

Montana farmers, faced with sharp acreage reduction requirements under the new farm program, are intending to plant 18 percent fewer acres of small grains than last year. This assessment was based on farmer's analysis of conditions and programs as of March 1, and could change before final planting. Soil moisture going into the spring planting season is mostly adequate--contrasting sharply with the early drouth of a year ago.

The intended all wheat acreage, including winter wheat already seeded, at 4.4 million bushels is down 22 percent. Barley acrage is expected to be down only 4 percent--perhaps reflecting the need to build up feed and malting stocks badly depleted by both drouth and sprout damage a year ago. Montana farmers also intend to cut 13 percent more hay acres than last year in order to replenish stocks.

Corn and sugarbeet acreages are expected to increase while dry bean acreage is pointed down--mainly in response to price prospects for these crops.

MONTANA DEPARTMENT OF AGRICULTURE

MARCH 1 POTATO STOCKS

Total stocks of potatoes in Montana on March 1, at 1,300,000 cwt were 25 percent below a year ago.

Nationally, March 1, 1986 potato stocks totaled an estimated 137 million cwt, up 16 percent from last year and 22 percent above two years ago. Heavy cullage continues in Western States where shrinkage and sorting losses are more than double last season. Stocks on-hand now account for 40 percent of fall production in the 15 storage States compared with 39 percent last March 1.

The six Western States stored a total of 90.5 million cwt on March 1, 1986. This is 15 percent above last year and 18 percent above two years ago. Idaho stocks at 46.0 million cwt are 11 percent above last year. Very heavy sorting is being done on potatoes still showing frost damage from last October. In addition, reports indicate that 11 percent of potatoes still in storage are frost damaged. Washington storages contained 21.0 million cwt of potatoes on March 1, 27 percent above last year. Oregon stocks, at 10.5 million cwt, were up 21 percent, and in Colorado, stocks of 9.35 million cwt were up 31 percent. California and Montana show 15 and 25 percent fewer potatoes on hand, respectively, than a year ago.

MONTANA EGG PRODUCTION

Montana poultrymen produced 49 million eggs in the December-February quarter--4 percent less than the previous quarter, but 4 percent more than in the same period a year ago.

The average number of layers in the flocks during the quarter was 788,000, 3 percent less than the previous quarter, but the same as a year ago.

The Nation's laying flock decreased 1 percent in size compared with last year and egg production was down 1 percent.

AGRICULTURAL ESTIMATING PROGRAM CHANGES

The U.S. Department of Agriculture's Statistical Reporting Service had to modify portions of its crop, dairy, poultry, and prices paid estimating program because of reduced funding levels in fiscal year 1986. the program modifications resulted in the following adjustments that had to be made to SRS programs in Montana.

*Discontinue production forecasts of winter wheat in September and hard spring and durum in October.

*Discontinue production forecasts of barley and oats in July.

*Discontinue quarterly on and off farm stocks estimates for barley and oats, except for an end-of-marketing year estimate in June.

*Change quarterly schedule of grain stocks surveys:

FROM: January, April, June, October
TO: December, March, June, September

*Prospective plantings survey will be changed from February 1 to March 1.

*Pasture and range condition maps will be replaced by crop moisture maps from the National Weather Service.

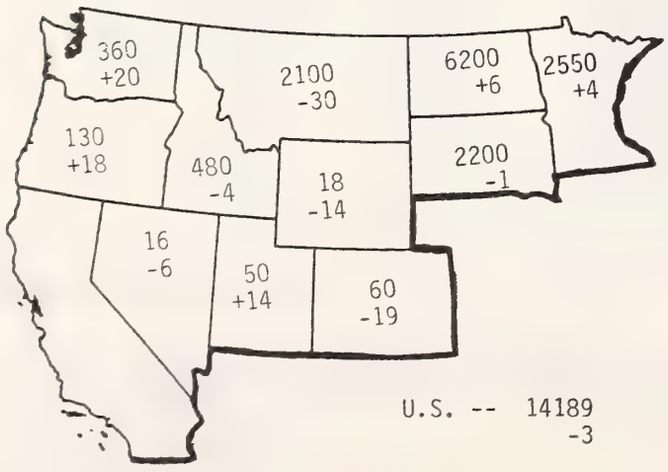
*Discontinue all fertilizer production and consumption statistics published by SRS.

*The frequency of several surveys measuring prices paid by farmers will be reduced.

More detail about the program modifications can be obtained by contacting our office.

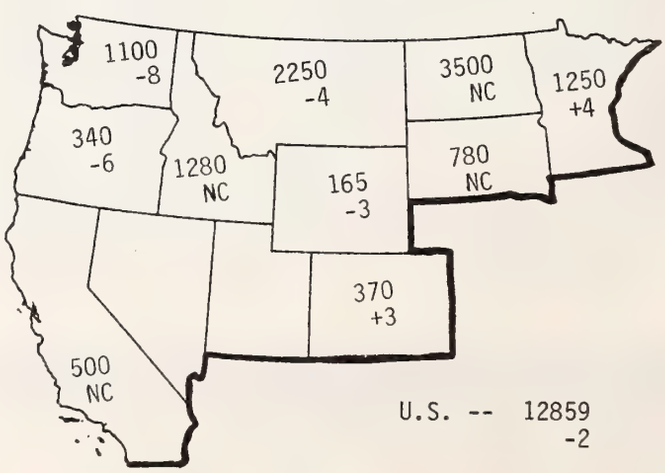
1986 OTHER SPRING WHEAT PLANTING INTENTIONS

000 Acres & Percent Change Change From 1985



1986 BARLEY PLANTING INTENTIONS

000 Acres & Percent Change From 1985



FARM INCOME, PRODUCTION COSTS & THE FARM BILL

The Food Security Act of 1985 begins a 5-year Federal Government program to allow U.S. prices for wheat, feed grains, cotton, and rice to become competitive on the world market. Loan rates are more closely linked to market prices than under the last farm bill, although target prices are frozen for 1986 and 1987 to bolster farm income. The act also authorizes a conservation reserve of up to 45 million acres. Farmers will recieve an annual rental payment in return for placing land in the reserve for 10 years.

Lower crop loan rates are designed to boost use of U.S. commodities. The bill's success hinges on whether competitive prices will raise exports enough to reduce American grain and cotton farmers' reliance on farm programs.

Exports in 1986/87 will likely increase significantly, but 1985/86 export movement has slowed for several commodities. Traders are sorting out the implications of the new commodity programs and awaiting announcement of additional details, especially on rice and cotton. Summer-quarter corn sales will likely slow considerably as importers delay purchases until fall in anticipation of sharply reduced prices.

The farm bill's biggest impact on milk production will probably come from the herd buyout program. The bill aims to remove 12 billion pounds of production capacity by September 1987. Despite the extra animals from the buyout program, cow slaughter for 1986 may still be down somewhat from a year earlier, because of continuing declines in the beef cow inventory.

Net farm income in 1986 is forecast to decline again. A large drop projected for total expenses will be offset by a decline in crop marketing receipts and a lower value of inventory change. Net farm income is currently forecast to total between $21 and $25 billion, following the expected $29 to $32 billion in 1985 and the record $34.5 billion in 1984. Net cash income is forecast at $37-$41 billion, down from last year's forecast record $41-$44 billion, but about even with 1984's $39.2 billion. Cash income will be supported by higher livestock prices and large Government payments to crop farmers.

The prices of major production inputs fell in 1985 and are forecast to continue falling in 1986. As a result, 1986 variable expenses for crop production should average 1 to 2 percent lower. Livestock production expenses, which include feed costs, will decline significantly.

THE 1986 WHEAT and BARLEY PROGRAMS

In recent years the majority of Montana's grain producers elected to participate in the wheat program only. Many elected not to participate in the barley program; however, they did produce barley and certify their barley acreage with ASCS. For many grain producers, this pattern of participation may change with the 1986 wheat and barley programs.

This year grain producers with substantial wheat and barley bases may want to consider participation in both programs. There are different options available and producers will have to find the one that best suits their own operation. Producers can find help in evaluating different aspects of the programs by contacting their local County Extension offices. Worksheets are available that will help evaluate individual or joint participation in the 1986 wheat and barley programs. You'll need the following basic information about your operation to make an accurate evaluation:

--Wheat and barley bases,
--ASCS wheat and barley program yields,
--Expected prices for wheat, barley and non-program crops,
--Variable production costs for wheat, barley and non-program crops.

Contact your local County Extension office for more help on this.

FEBRUARY LIVESTOCK SLAUGHTER

Montana slaughter plants produced 1.3 million pounds of red meat in February 1986, 27 percent less than January and 62 percent less than February a year ago.

Cattle slaughter was 1,700 head, 65 percent less than last year. Hog slaughter was 2,000 head, 9 percent fewer than February 1985.

Commercial red meat production for the United States in February 1986 totaled 2.94 billion pounds, virtually unchanged from February 1985. **BEEF PRODUCTION,** at 1.77 billion pounds was virtually unchanged from the previous year. Average live weight increased 20 pounds to 1,107. **VEAL PRODUCTION,** at 40 million pounds, was up 8 percent. **PORK PRODUCTION,** at 1.10 billion pounds declined 1 percent. Average live weight increased 1 pound to 243. **LAMB AND MUTTON PRODUCTION,** at 27 million pounds, was down 4 percent. Average live weight increased 3 pounds to 118.

featuring. . . . . PARK COUNTY

Park County is located in south central Montana, along the Montana/Wyoming border. Almost the entire southern boundary of the county makes up the northern border of Yellowstone Park. The Yellowstone and Shields Rivers traverse the length of Park County and join near Livingston, Montana where they continue east into neighboring Sweet Grass County. Nearly two-thirds of the county is blanketed by the mountains of the Gallatin National Forest, which includes a major portion of the Absaroka-Beartooth Wilderness Area. The highest point in Montana, Granite Peak, with an elevation of 12,799 feet is located in eastern Park County.

Farmers harvested crops from 50,800 acres of irrigated land in Park County in 1984, compared with 35,700 acres of dryland crops. The major crop produced is hay, followed by barley and winter wheat. Cash receipts from the sale of crop items brought Park County $4,563,000 in 1983.

Cattle, sheep, and hogs are all raised in the county. Receipts from the sale of livestock and their products contributed $14,969,000 to the county's economy in 1983. Government payments added $821,000 making a total of $20,353,000 from Park County's agricultural production.

FEBRUARY WEATHER: MAKING THINGS LOOK BETTER

This is the time of year when ranchers are busy with calving and lambing. Farmers are tuning up their tractors and getting seed and fertilizer lined up for spring planting. The big question still weighing on everybody's mid is, "Will the drouth cycle be broken this year?" Everyone has their own opinion and they cite ocean currents, sunspots, snowpack, and Aunt Maude's rheumatism as good reasons for their particular forecast.

Based on this year's February crop weather report, the moisture situation is much better than a year ago. Precipitation during February was normal to above normal in all but three of our 42 weather stations. A year ago we had only five stations with normal to above normal moisture. February temperatures were about normal west of the Divide and 3 to 10 degrees below normal east of the Divide. This put heavy demands on the State's short feed supply. By the end of the month, calving was 25 percent complete while lambing was about 20 percent done. The winter wheat crop was rated in fair to good condition by our reporters. Snowcover provided more protection for the crop this year than a year ago.

Yes, spring work will start soon and a new cycle will begin. We're all cautiously optimistic that the spring rains will arrive this year. We simple can't afford another year of drouth.

MONTANA CASH RECEIPTS DOWN

Preliminary cash receipts data indicate Montana farmers and ranchers have taken in 4 percent less from the sale of commodities in 1985 than in 1984. Livestock receipts are up 1 percent, but crop receipts show a 9 percent drop.

Agriculture Day • March 20, 1986

AGRICULTURE
America's Heartbeat
Vital to Us All

March 20 to be Designated 'National Agriculture Day'

Thanks to a recently-passed joint congressional resolution, President Reagan once again has the authority to declare the first day of spring—March 20—as "National Agriculture Day."

Agriculture Day, initiated in 1973 by several agricultural publications, organizations and companies, was first made an official observance in 1981. The Agriculture Council of America serves as national coordinator of Agriculture Day, which is observed primarily at the city and community level with activities organized by hundreds of producers, other agricultural businesses and students.

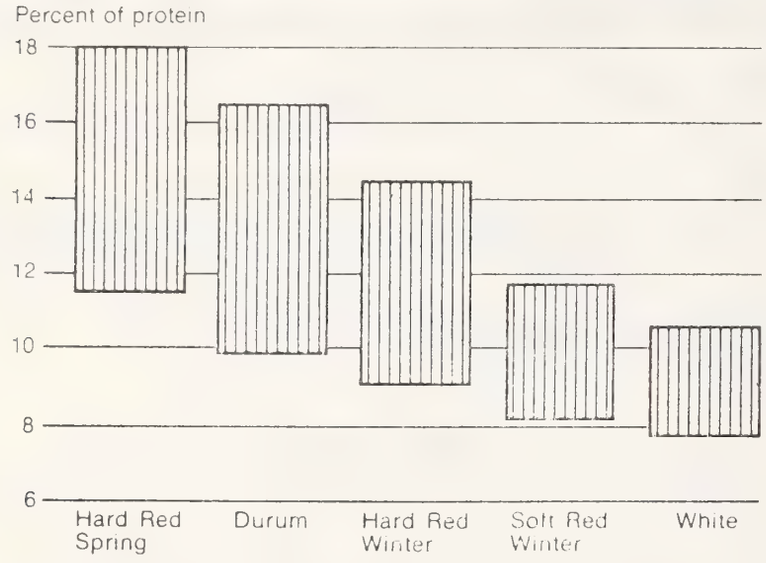
The purpose of Agriculture Day is to set aside a specific time to increase public understanding of the achievements of the 23 million men and women in modern agriculture who generate more than 20 percent of this country's gross national product.

The program's longtime slogan is "Agriculture: America's Heartbeat." This years observance has the theme, "The Business of Food and Fiber."

WHEAT CLASSES

An aspect of wheat that separates it from other crops is that there are five major classes of wheat grown in the United States: hard red winter (HRW), soft red winter (SRW), hard red spring (HRS), white, and durum. These classes are grown in distinct regions, have different end uses, and are marketed separately. The following chart illustrates the range of flour uses of the different classes and the potential for substitution among classes.

Protein Range and Flour Uses of Major Wheat Classes



Flour Uses

- Used to blend with weaker wheats for bread flour
- Whole wheat bread, hearth breads
- Egg noodles (U.S.), macaroni, and other alimentary pastes
- White bakers' bread, bakers' rolls
- Waffles, muffins, quick yeast breads, all-purpose flour
- Noodles (Oriental), kitchen cakes and crackers, pie crust, doughnuts, and cookies, foam cakes, very rich layer cakes

Flour uses are approximate level of protein required for specified wheat products.
Durum is not traded on basis of protein content.

The United States exports all five classes of wheat. HRW, the most important bread wheat, is exported principally to the USSR, Brazil, China, and Japan. China is our largest customer for SRW which is used for cakes, pastries, and crackers. HRS is also a bread wheat, but there is no single outstanding buyer. White wheat is imported mostly by Asian countries, primarily South Korea, Japan and India, where if is used for noodle products. Egypt is also a large importer of white wheat. SRW, HRS, and white wheat are exported in roughly equal amounts. Less than 5 percent of U.S. wheat exports are durum; the largest importers are Tunisia and Algeria.

Because wheat production is less concentrated than other major crops, such as corn or cotton, the national average yield for all wheat varies less from year to year. During 1970-82, the average variability in wheat yields was 5 percent; for corn it was 12 percent, and for cotton, 14 percent. This means that, compared with other crops, imbalances in total wheat supply and demand are less likely to be caused by weather. And, when supplies are excessive, weather is less likely to come to the rescue.

The fact that the wheat program has operated on the basis of a single national average farm price is a reflection of the substitution among the classes of wheat which are traded for the most part on protein content. However, problems occasionally arise. Of the different classes, durum is the most specialized in terms of use. In 1983, durum prices were abnormally high relative to the national average farm price for all wheat. Yet, durum could not be sold without penalty from the farmer-owned wheat reserve because the rules for selling from the reserve are based on the national average price. As a result, durum export sales may have been lost even though supplies were on hand.

FEBRUARY FARM PRICES

The index of prices received by Montana farmers for all farm products in February at 144 (1977=100) is the same as January but down 9 points from February 1985. The all crops index at 145 was down 5 points from January, while the livestock index at 144 was up 5 points.

Prices went up for hay, steers and heifers, cows, calves, and lambs. Prices went down for all of the grains, sheep, hogs, milk and eggs.

Nationally, the February index of prices received by farmers for all farm products decreased 3 points from January to 121 percent of its January-December 1977 average. Contributing most to the decline from January were lower prices for tomatoes, cattle, lettuce, wheat, eggs, broilers, hogs, oranges, and corn. The index was 14 points (10 percent) below a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes, and farm wage rates for February was 163 percent of its 1977 average. The index was unchanged from January but was 1 point below a year earlier. Increases from January in the feeder livestock and family living components were offset by decreases in the fuels and energy and feed. Gasoline and diesel fuel prices dropped to their lowest level in nearly 6 years.

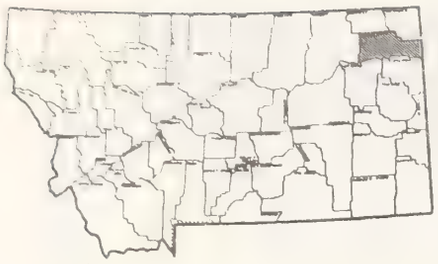
MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 145,000 gallons of ice cream during January--8 percent less than in January 1985. Creamed cottage cheese production at 342,000 pounds was 11 percent less than a year earlier. Butter output at 181,000 pounds was down 19 percent. American cheese production at 318,000 pounds was 61 percent above the same month a year ago.

featuring. . . . . . ROOSEVELT COUNTY



Located in extreme northeastern Montana, Roosevelt County has the lowest altitude in the state. The approximate land area of the county is 1,508,665 acres. According to the 1982 U.S. Census of Agriculture, 1,371,234 of those acres are in farmland. The Montana/North Dakota border marks the eastern boundary of Roosevelt County, while the Missouri River marks the entire southern boundary. The Poplar River traverses the county from north to south, emptying into the Missouri River at the southern border. The Fort Peck Indian Reservation occupies all but the eastern section of the county. The terrain is mainly rolling prairie.

Roosevelt County is a prominent agricultural area in the state. The cropland is largely non-irrigated and a variety of crops are raised there. In the 1984 crop production figures, the county ranked 2nd in spring wheat and also in durum wheat production, and came in 11th amonth the oats producing counties. Barley, winter wheat and hay are also grown.

Although crops are the main source of agricultural income, livestock are also an important part of the county's economy. Roosevelt County came in 19th in hog production in the December 1, 1982 inventory. In the January 1, 1983 sheep and cattle counts, Roosevelt County came in 37th and 44th place, respectively.

Cash receipts for crops in 1983 were $34,182,000. The sale of livestock & livestock products contributed $8,327,000, and government payments added $10,993,000--making for a total of $53,502,000 in all cash receipts for Roosevelt County in 1983.

MONTANA 1985 CROP SEASON IN REVIEW

Almost all of Montana was in the grip of a major, general drouth in 1985--the second year in a row for the major crop areas, and the third year for much of the eastern third of the State. Farmers began to hay or pasture drouth damaged small grains in early July to salvage what they could.

Although the winter wheat crop got off to a fair start the winter months were very dry, and by spring a severe infestation of cutworms and wireworms had developed. Winter kill was also above average and grasshoppers hatched early to inflict further damage.

The spring planting season was very difficult because of drouth and incessant winds. Germination was poor and crop development was retarded during most of the spring and early summer months. The only optimism occurred in early June when moderate rains fell but it was short lived. Drouth, hot temperatures, persistant winds, and grasshoppers decimated Montana's grain crops during late June and early July.

An abrupt end to the drouth came in early August with a rainy season that extended into October. Although the rains were too late for grain crops, they helped ranges and pastures and also started volunteer grain and weeds in stubble fields. The rains caused considerable sprouting in irrigated barley fields which was especially damaging to malting barley. The rains also disrupted winter wheat seeding to the point that only about 90 percent of the intended acreage got planted and much of that was too late to properly establish the stand before cold weather.

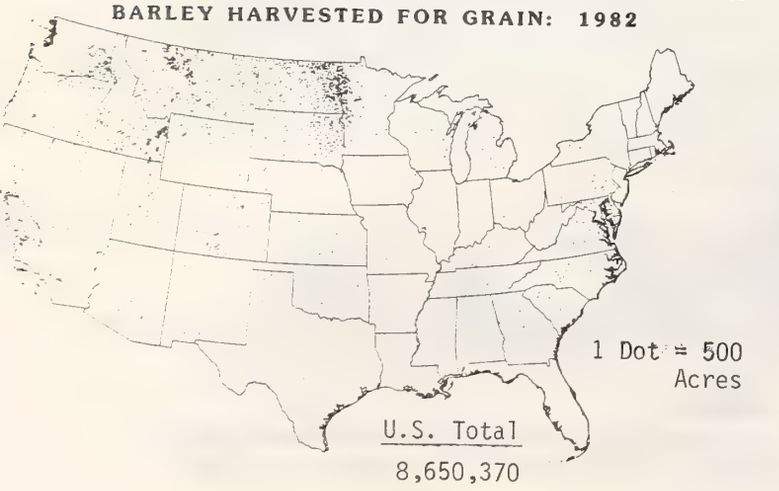
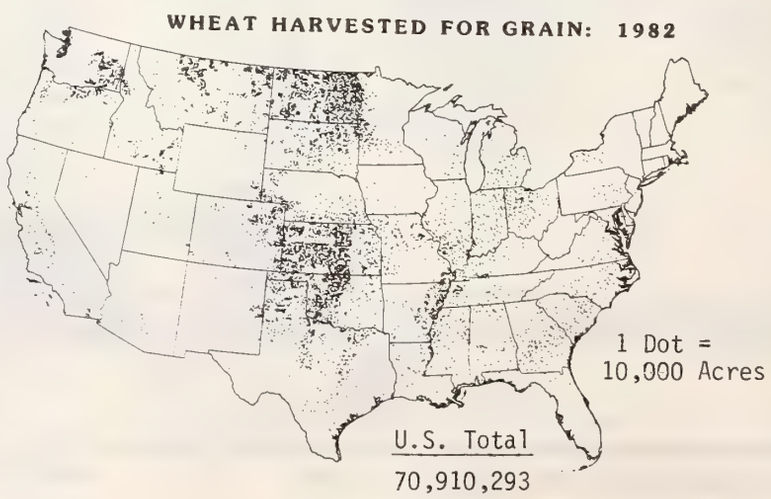
BARLEY HARVESTED FOR GRAIN: 1982



WHEAT HARVESTED FOR GRAIN: 1982



JANUARY LIVESTOCK SLAUGHTER

Montana slaughter plants produced 1.8 million pounds of red meat in January, 3 percent more than December, but 71 percent less than January 1985.

Cattle slaughter numbered 2,400 head, a 75 percent decrease from last year. Hog slaughter at 2,500 was down 4 percent from the previous year.

Nationally, beef production, at 2.14 billion pounds was up 4 percent. Head kill was 3.33 million, up 2 percent, and the average live weight increased 20 pounds to 1,100.

Veal production, at 46 million pounds was up 10 percent. Calf slaughter of 307 thousand head was up 7 percent and the average live weight increased 7 pounds to 249. **Pork production** totaled 1.27 billion pounds, down 1 percent. Hog kill at 7.19 million head decreased 2 percent and the average live weight increased 1 pound to 246. **Lamb and mutton production,** at 31 million pounds, was down 3 percent. Slaughter totaled 518 thousand head, down 7 percent, and the average live weight increased 3 pounds to 118.

POTATO STOCKS DOWN

Total stocks of potatoes in Montana on February 1 at 1,350,000 cwt were 25 percent below a year ago.

Nationally, potato stocks on February 1, 1986 totaled 170 million cwt, up 17 percent from last year and 22 percent above two years ago. Frost damage suffered during harvest last fall continues to plague storage operators in Western states. Shrinkage and sorting losses to date in 5 states (Idaho, Montana, Colorado, Oregon, and California) are running 89 percent above last year. This means a lower than normal percentage of production will be available for sale this year.

February stocks in the 15 potato storage states accounted for 50 percent of fall production this season compared with 48 percent last year. Stocks in the 11 major states are 3 percent reds, 19 percent whites, and 78 percent russets.

In the six Western states, February 1 potato stocks totaled 111 million cwt this year, up 18 percent from last year and 21 percent above two years ago. Idaho storages contained 56.5 million cwt, remaining 19 percent above last year. An estimated 11 percent of Idaho's stocks on hand now are said to be frost damaged. Washington stocks totaled 25.7 million cwt, up 24 percent; Oregon at 13.3 million cwt is up 21 percent; and Colorado at 11.0 million cwt, is up 24 percent from a year ago. California and Montana stored 22 and 25 percent fewer potatoes than a year ago.

1985 FARM FINANCE REPORT

Drouth and low farm prices have continued to depress Montana's agriculture. Wheat production during 1985 was the lowest since 1939 and heavy livestock liquidation has reduced the cattle herd to the lowest count in 23 years. Low farm income has depressed land values and further stressed farm and ranch finances. These conditions have also impacted the rural community and the farm credit system. This report provides an update to a farm finance survey conducted in October of 1984. It provides a measurement of the financial status of Montana farmers and ranchers throughout the 1985 calendar year.

Total assets averaged $623,844 per farm or ranch, down 19% from 1984, for a statewide reduction of $3.4 billion. Debt per operation also declined, averaging $173,563, down 20%, resulting in a total drop in net worth to Montana agriculture of $2.3 billion--down 18%. Based on crop and livestock inventory reductions, it appears assets have been sold off to pay off debt. Respondents seemed to have difficulty appraising the value of their real estate. Many are hesitant to accept reductions that are indicated by distressed sales and prefer to keep an optimistic balance sheet. Adopting lower land prices would result in even higher debt to asset ratios.

The delinquency rate on real estate loans has increased. From 18% in 1984 to 24% in 1985. Operating loan delinquencies went from 31% to 33%. A closer look shows both real estate and operating loan delinquencies were much higher for operations smaller than 3,000 acres. Sixteen percent had loan applications turned down, but nearly half of those obtained credit elsewhere.

Given current trends in farm income and expenses, 51.5 percent of Montana producers said they would quit farming in five years or less. Forty-two percent said they could continue until retirement--down from 48% in 1984. Economic conditions are especially bad in the southwest where 82% would quit in five years. In the northeast two-thirds said they wouldn't survive.

A complete report with more detailed results of the survey can be obtained by send your request along with a large self-addressed, stamped envelope to:

featuring. . . . . PETROLEUM COUNTY

Petroleum County occupies approximately 1,057,254 acres of land in central Montana. The surface of the land is generally rolling with valleys and benches. The extreme north/northeastern border of the county is defined by portions of the Missouri River and Ft. Peck Lake. The Musselshell River defines the remainder of the eastern border. The county is traversed by Flat Willow Creek from the south, and Box Elder creek from the north. They eventually join and empty into the Musselshell River on the eastern border of the county. The Sacagawea River crosses the northern leg of the county and flows into Ft. Peck Lake.

Farmland in Petroleum County is split almost equally between non-irrigated and irrigated cropland. Crops grown in the area include winter and spring wheat, barley, oats, and hay. The county ranked 28th in hay production, 37th in oats, 46th in barley, and 44th and 49th in spring and winter wheat production for 1984.

Petroleum County is not an extensive livestock producing county but sheep and cattle are raised here. The county ranked 27th and 37th, respectively, in the January 1, 1983 sheep and cattle inventories. Some hogs are also raised but not to a great extent.

Cash receipts for the county totaled $10,446,000 in 1983. Livestock receipts made up $7,852,000 of that total, while crops receipts contributed $2,088,000. Government payments added the remaining $506,000.

JANUARY 1 CATTLE COUNT DOWN

Montana's cattle herd was reduced 17 percent in the past year according to a January 1 cattle inventory survey. The cattle inventory shows 2.45 million all cattle and calves on January 1, 1986. This is the smallest herd since 1963, and the largest year to year decline since 1937 when the herd was cut 28 percent. **Beef cows and heifers that have calved** were down 9 percent while **bulls** were down 10 percent.

The largest reduction was shown by **calves weighing less than 500 pounds.** At 315,000 head they were down 44 percent from last year. **Steers over 500 pounds** were off 24 percent compared with January 1, 1985. **Heifers being kept for beef cow replacements** at 230,000 head are down 10 percent. **Other heifers** are down 7 percent. The **1985 calf crop** at 1.47 million was 9 percent smaller than the previous year.

All cattle and calves in the United States as of January 1, 1986 totaled 105 million head, down 4 percent from the 110 million on January 1, 1985 and 7 percent below the 114 million two years ago. This continued the recent downward trend in cattle inventories for the fourth consecutive year and was the lowest number on hand since 1963. The **1985 U.S. calf crop** is estimated at 41.0 million, down 3 percent from 1984, down 7 percent from 1983 and is the lowest since 1961.

SURVEY RESULTS

SHEEP NUMBERS DOWN

The results of a January 1, 1986 survey of sheep and lamb producers indicated numbers were 18 percent below January 1 a year earlier.

Sheep and lambs on feed for the slaughter market were cut nearly in half with 23,000 in feedlots compared with 45,000 last year. Stock sheep at 400,000 head were down 15 percent. This is the smallest flock since 1881, and only a remnant of the 5.7 million sheep in Montana in 1903 when numbers reached their peak. Ewes one year old or over were down 15 percent and ewe lambs less than one year old were down 10 percent. The 1985 lamb crop at 420,000 was 11 percent less than 1984.

The value of all sheep and lambs on Montana farms and ranches was $26.0 million, down 12 percent from last year.

Nationally, all sheep and lambs on January 1, 1986 totaled 9.93 million down 5 percent from the 10.4 million a year earlier. The stock sheep inventory dropped to a record low 8.44 million head, down 5 percent from the previous record low count of January 1, 1985.

HAY and ROW CROPS

The 1985 **hay crop** harvested by Montana farmers and ranchers was the smallest since 1961. Hay production was down 27 percent from 1984 and 32 percent from 1983.

Corn for grain production was down 24 percent and **dry beans** produced in the state were down 62 percent from a year ago.

Montana's **sugarbeet crop** was almost double the 1984 output mainly due to a large acreage increase. **Potato production** was down 2 percent. A substantial portion of the potato crop suffered freeze damage and had to be eliminated from storage.

Montana's Rank

CHICKEN NUMBERS DOWN

SURVEY RESULTS

Montana chicken numbers and value both dropped in 1985. The December 1, 1985 inventory was 1.01 million birds, 1 percent below a year earlier. The inventory included 790,000 hens and pullets of laying age. The inventory value of all Montana chickens December 1, 1985 dropped 11 percent to $1,818,000. The average value per bird at $1.80 was 20 cents less than the previous year.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 93,000 gallons of ice cream during December--10 percent less than in December 1984. Creamed cottage cheese production at 287,000 pounds was 37 percent less than a year earlier. Butter output at 182,000 pounds was up 14 percent. American cheese production at 328,000 pounds was 13 percent above the same month a year ago.

HELENA, MONTANA 59620

IN BRIEF. . . OUTLOOK FOR 1986

Net farm income in 1986 is projected to range from $22 to $26 billion, compared with $25 to $29 billion in 1985 and $34.5 billion in 1984. Gross income will likely fall more than production expenses.

Net cash income this year is expected to be near 1985, as Government programs continue to support farm income. Net cash income may range from $37 to $41 billion.

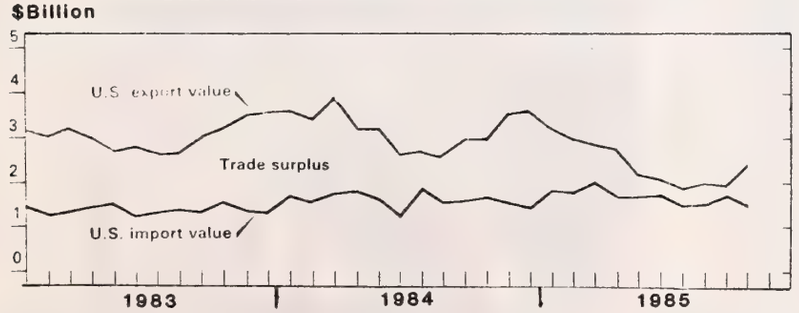
U.S. farm product exports in fiscal 1986 are forecast at $29 billion, 7 percent below 1985's $31.2 billion and nearly $15 billion below the 1981 peak. Export value will slip because both prices and volume will likely fall. Volume is forecast at a little over 120 million tons, down 4 percent from 1985, because of continued strong competition from other exporters and large production gains by traditional importers.

Beef production in 1986 could fall 4 to 6 percent from 1985, the result of a drop in slaughter numbers and lighter slaughter weights. Pork production is forecast to decline about 1 percent. However, fall quarter 1986 production may rise 3 to 5 percent from 1985, marking the beginning of an expansion likely to carry into 1987. With costs of production stable and output of red meat down, broiler producers are expected to increase output 4 percent in 1986.

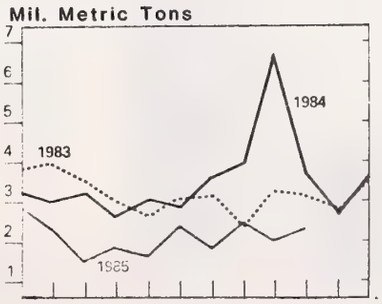
Milk production for next year is forecast to reach a record 148 billion pounds, up 3.3 percent from this year. Commercial use will also probably gain, likely reaching nearly 132 billion pounds, but the increase will be less than the boost in supply.

The **feed grain** outlook for 1985/86 is one of record U.S. output, diminished Soviet demand, and large competing supplies in world trade. Prices are depressed, and the 1985/86 U.S. carryout is expected to top the 1982/83 pre-PIK record. Global coarse grain production is forecast to reach 845 million tons, 4.5 percent over last season's record.

U.S. AGRICULTURAL TRADE BALANCE



U.S. WHEAT EXPORTS



CONSERVATION RESERVE PROGRAM

In the next couple of months you're going to hear a lot about the Conservation Reserve Program. It's a new and interesting part of the 1986 farm bill. It's a plan to conserve soil. The plan calls for a removal of highly erodible cropland from production and planting the land to trees and grasses. The primary purpose of the program is to save our precious soil resources! Other objectives are to reduce production of surplus crops, to reduce sediment run-off in our rivers and streams, and to provide improved habitat for fish and wildlife.

It looks like a huge rental program. U.S.D.A. will contract with farmers and ranchers to rent marginal cropland for a period of ten years. About 342 thousand acres will be targeted for the program this year in Montana. This is the third largest acreage in the nation. Details about the program are still a bit fuzzy, but sign-up procedures will be forthcoming from the Montana Extension Service, Soil Conservation Service, and ASCS.

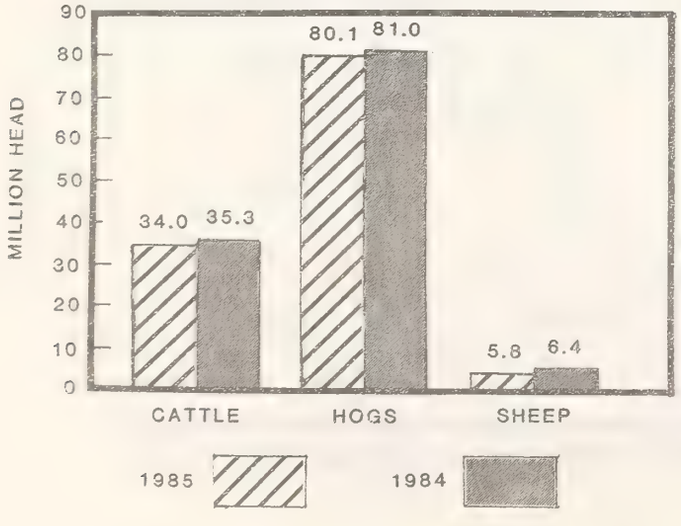
DECEMBER SLAUGHTER DROPS

Commercial red meat production in Montana during December totaled 1.7 million pounds, 5 percent less than November and only 25 percent of December 1984. Total red meat production in the state for all of 1985 at 28.7 million pounds is 54 percent below 1984.

There were 2,400 cattle killed and 2,400 hogs slaughtered during December. For the year 1985 there were 40,000 cattle and 31,900 hogs slaughtered, both were less than half of the previous year.

Commercial red meat production for the United States in December 1985 totaled 3.14 billion pounds, up 1 percent from December 1984. January-December red meat production, at 39.1 billion pounds was up fractionally from last year. The 1985 accumulated production percentage changes by individual components were: beef, up 1; veal, up 4; pork, virtually unchanged; lamb and mutton, down 6.

LIVESTOCK SLAUGHTER



POTATO STOCKS

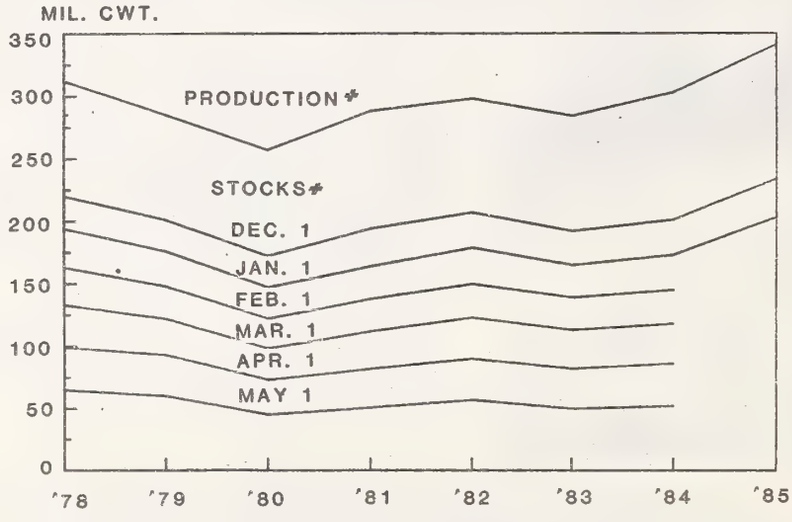
Montana potato stocks on hand January 1, 1986 totaled 1.40 million cwt, down 23 percent from a year ago.

Nationally, potato stocks on January 1, 1986 totaled 201 million cwt, up 16 percent from last year and 22 percent above two years ago. The January 1 stocks averaged 59 percent of fall production this season compared with a 57 percent share last year. Losses are also up sharply, running 32 percent higher than last year. Russets made up 77 percent of the stocks; while whites covered 20 percent and reds 3 percent.

The six Western States stored a total of 129 million cwt of potatoes on January 1, 1986, up 17 percent from last year and 20 percent above two years ago. Idaho stocks of 65.0 million cwt are up 19 percent from last year. However, remaining stocks carry an estimated 12 percent that will be unmarketable due to frost damage. Washington, at 30.0 million cwt is up 16 percent; Oregon storage of 15.7 million cwt is up 22 percent; and Colorado stocks at 12.9 million cwt are up 18 percent. California and Montana carried fewer potatoes in storage than last year.

FALL POTATOES: PRODUCTION and STOCKS

(For 15 States Estimating Potato Stocks)



*Production by crop year. Stocks by months following harvest.

FOOD PRICES & CONSUMPTION

In 1986, the Consumer Price Index for food is expected to average 2 to 4 percent higher than in 1985. For 1985, the index should average 2.2 percent above 1984. The general inflation rate is expected to remain near 4 percent in 1986, as it has for the past two years. The rate of growth in consumer demand for goods and services is expected to stay slow through this year, adding little strength to food prices.

Smaller supplies, particularly of red meats, will lead to an increase of 2 to 4 percent in the farm value of food in 1986. Smaller supplies will also mean stronger retail prices for many foods. Food consumption is expected to decrease 1 to 2 percent.

Although lower red meat supplies and higher red meat prices will help boost the average farm value of all foods, the farm value of most categories besides red meats is expected to fall slightly. Barring a freeze in the fresh winter vegetable growing areas, the farm value of fresh vegetables will decrease nearly 6 percent because of large supplies and low prices for potatoes.

The farm-to-retail price spread increased more than 5 percent in 1985. This was the largest increase in four years, reflecting lower farm prices for many foods but slightly higher retail prices. A slight rise in the cost of marketing food accounted for a portion of the 1985 growth in the spread.

The wider spread in 1985 suggests some recovery in food industry profits, following the recession of the early 1980's, when some food processors were suffering severe losses. In 1986, the farm-to-retail spread will rise at about the same rate as the general rate of inflation.

U.S.D.A. DELAYS PLANTING INTENTIONS SURVEY

The acreage intentions survey that was to have been taken February 1, 1986 will be delayed until March 1. The month delay will provide farmers an opportunity to become aware of the 1986 farm program prior to completing the intentions questionnaire. Specific provisions and implementation guidelines of the new farm program are not likely to reach county ASCS offices until mid-February. Thus, farmers would have only very limited knowledge of the 1986 farm program and would find it difficult to respond and complete the questionnaire on February 1.

The proposed release date for the results of the survey will be March 18, 1986.

FARM COSTS SURVEY IN FEBRUARY

Current economic conditions on Montana farms and ranches and across the nation's farm belt have a large impact on decisions made by the U.S. Congress and state agricultural officials. These decisions must be based on sound, reliable information of how things are on the farm. Farmers and ranchers will have a chance **to tell it the way it is** on the upcoming Nationwide Farm Costs and Returns Survey to be conducted in February 1986.

It's necessary to obtain as many completed reports as possible to accurately reflect the current farm financial plight in Montana. If you are one of the 300 farmers selected to participate in this year's survey, please take time to work with the interviewer who will be contacting you, as your report will be representing many other farmers. All information you provide will be kept confidential and only used to produce regional and national estimates of farm production expenses and income.

MILK PRODUCTION

Montana dairies produced 91 million pounds of milk during the October-December 1985 quarter--7 percent more than the same quarter in 1984. The current quarter's production is 4 percent below the 1985 July-September quarter.

Nationally, milk production during the last quarter of the year totaled 35.6 billion pounds, 10 percent more than the same quarter in 1984. Accumulated milk production during 1985 at 143 billion pounds was 6 percent above the 1984 production.

featuring. . . . . SILVER BOW COUNTY

Created in February of 1881 and occupying 459,769 acres of land in southwestern Montana, Silver Bow County is the smallest of all Montana counties. Yet, the size of its land area belies all the county has to offer. The terrain is largely mountainous and picturesque sections of the Deer Lodge National Forest occupy land in the northern, southwestern, and southeastern portions of the county. A section of the Continental Divide traverses the entire width of the county. Half of the southern boundary is designated by the Big Hole River. Silver Bow is also home to the city of Butte, famous for its mining and rich history.

Looking at the agricultural picture, Silver Bow County ranked 28th in all hay, 37th in oats, and 46th in barley production in 1984. Cattle, sheep and hogs are all raised in the area with the county ranking 54th, 56th, and 56th, respectively, for those commodities.

Cash receipts from the sale of livestock and livestock products totaled $2,248,000 in 1983. Receipts from the sale of crop items came to $198,000 for a total of $2,446,000 in 1983.

DROUGHT SHARPLY CUTS GRAIN PRODUCTION

Montana's 1985 all wheat production was 52 percent below 1984 and the smallest wheat crop produced since 1939. These figures came from the results of an acreage and production survey that was sent to producers last fall. The winter wheat crop was the smallest since 1947 and both the hard red spring and durum crops were the smallest since 1961. The survey also revealed the barley crop was drastically reduced and the 1985 production was 49 percent below 1984. This is also the smallest barley crop produced since 1961. Oats production was down 41 percent from 1984. It was the smallest crop since 1889 mainly due to the small acreage harvested for grain. Montana's total small grain production (wheat, oats, barley) at 82.6 million bushels was less than half of the previous year. A table with acres, yield and production is on the inside page.

HAY STOCKS DOWN SHARPLY

Stocks of hay on Montana farms as of January 1, 1986 were 2.1 million tons, 31 percent less than a year ago, and the smallest amount on hand since January 1, 1950. The reduced stocks level was mainly due to a severe drouth during the growing season which reduced total hay production, but it has also been impacted by record low temperatures during November which greatly increased feeding requirements.

Last year, Montana livestock producers utilized 2.5 million tons between January 1 and May 1. Whether the stocks on hand will stretch to the end of the feeding season will depend on the extent of livestock inventory reductions that have taken place and the prospects for early spring grazing. However, some localized shortages can be expected to be severe.

STILL MOST EFFICIENT

Has U.S. agriculture lost its competitive edge in food production? Has our technology and productivity been outpaced by our foreign competitors? The answer to these questions is a definite 'no' according to a report from U.S.D.A.

Measuring production costs of wheat among different countries--it appears the U.S., and especially the Northern Plains, can produce wheat as cheaply as any foreign competitor. It was found the variable cost of producing a bushel of wheat was $1.29. That's basicly the out-of-pocket cost excluding the value of land, labor and depreciation. It also appears that productivity gains for both farmland and agricultural labor rose much faster here than in the rest of the world. This means we should have widened our competitive advantage to produce food. But, why haven't we sold more, why are our exports down about 1/3 from 1981? Well, the answers boil down to the same old gremlins--the high value of the dollar and competition that's subsidized. So, given a level playing field, our farmers can compete effectively on the world market.

1986 WINTER WHEAT ACREAGE

Montana farmers planted 2.15 million acres of winter wheat this past fall for harvest in 1986, the smallest acreage planted since 1972. The 13 percent decline in acreage from 1985 was largely due to fields being too wet for seeding equipment to operate early in the planting season, and then weather turning unseasonably cold later in the fall. At the end of December, the crop was reported to be in fair to good condition.

Nationally, growers planted 54.0 million acres in the fall of 1985 for the 1986 crop--7 percent less than the previous year.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 120,000 gallons of ice cream during November--12 percent less than in November 1984. Creamed cottage cheese production at 316,000 pounds was 32 percent less than a year ago. Butter output at 174,000 pounds was down 1 percent. American cheese production at 263,000 pounds was 65 percent above the same month a year ago.

DECEMBER FARM PRICES

Montana December farm prices continued on the weak side with some improvement in grains but decreases for most livestock items.

The all farm products price index for December was 142 percent of the 1977 base, the same as a year ago. However, the November index was 146 percent. The crops index was 154 percent in December, 152 percent in November and 150 in December 1984. The livestock and products index was 130 percent in December, 140 percent in November and 133 percent a year ago.

Nationally, the December index of prices received by farmers for all farm products increased 1 point from November to 128 percent of its January-December 1977 average. Higher prices for lettuce, hogs, corn, tomatoes and soybeans were partially offset by lower prices for oranges, broilers, cotton, lemons and wheat. The index was 7 points below a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for December was 163 percent of its 1977 average. The index was the same as last month and a year earlier. Feed prices were higher in December but their effect on the index was offset by lower feeder livestock prices.

MONTANA HOG NUMBERS DOWN

The Montana December 1 All Hog and Pig Inventory at 135,000 is down 13 percent from last year. Hogs on hand for breeding, at 16,000 are unchanged while market hogs at 119,000 are down 14 percent from a year ago.

Montana's 1985 pig crop totaled 244,000 head, down 2 percent from the previous year. The spring pig crop (December-May) at 126,000 was up 8 percent, but the fall pig crop (June-November) at 118,000 was down 10 percent.

The U.S. inventory of all hogs and pigs is estimated at 52.3 million head on December 1, 1985. This is 3 percent below a year ago and 8 percent less than December 1, 1983.

--Breeding hog inventory at 6.78 million, is 2 percent below last year and down 8 percent from two years ago.

--Market hog inventory at 45.5 million, is 3 percent below a year ago and 8 percent below two years ago.

The U.S. pig crop for 1985 totaled 86.0 million head, 1 percent below 1984 and 8 percent below the 1983 pig crop.

--December 1984-May 1985 pig crop, estimated at 42.5 million head, is up slightly from a year earlier but 10 percent below the comparable period in 1983.

--June-November 1985 pig crop, estimated at 43.5 million head, is 2 percent below last year, and 5 percent below the June-November 1983 crop.

U.S. hog producers intend to have 5.59 million sows farrow during the December 1985 - May 1986 period, up fractionally from a year ago.

POTATO STOCKS UP

December 1, 1985 potato stocks totaled 234 million cwt for the 15 states making stocks estimates. This is up 16 percent from last year and 22 percent above two years ago. Stocks averaged 69 percent of fall production this year in the 15 states compared with 66 percent last year. In the 11 major states in the Objective Yield Program, russets accounted for 76 percent of the storage; whites were 21 percent and reds 3 percent.

The six western states stored a total of 148 million cwt of potatoes on December 1, 1985, up 17 percent from a year ago and 20 percent above two years ago. Idaho stocks were placed at 74.5 million cwt, a gain of 21 percent from last year. Washington was up 13 percent; Oregon, up 20 percent; and Colorado, up 15 percent. In Idaho, shrinkage, dumping, and cattle feeding are much above normal as farmers clear their storages of frost damaged potatoes. Of those potatoes still in storage, about 11.5 percent will not be marketable due to frost problems. Frost damage is almost non-existent in southwestern and the western part of south central Idaho, but is an important factor in southeast counties. Potatoes harvested prior to the first frost period of September 28-30 are keeping well. Those harvested after the second frost period of October 8-9 are causing the majority of problems.

Disappearance from harvest to December 1 in the 15 states was 107 million cwt this year compared with 102 million cwt last year and 92 million cwt in 1983. Shrinkage and loss made up 20.4 million cwt of the total this year compared with 16.1 million cwt last year.

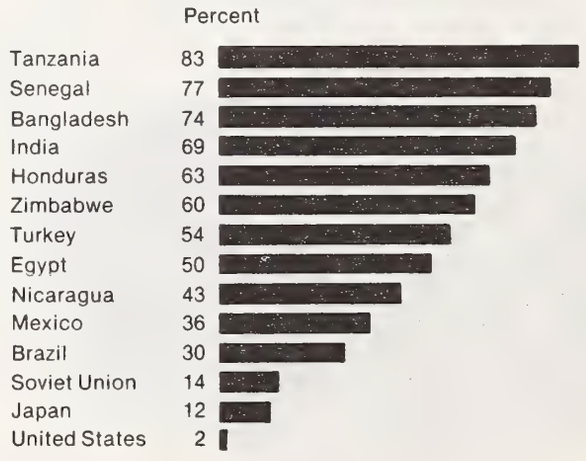
CATTLE ON FEED DOWN

Cattle and calves on feed December 1 for the slaughter market in the 7 states preparing monthly estimates totaled 7.88 million head, down 8 percent from a year ago but 1 percent above December 1, 1983. **MARKETINGS** of fed cattle during November totaled 1.38 million, a decrease of 8 percent from last year and 5 percent less than November 1983. **PLACEMENTS** of cattle and calves on feed in the 7 states were 1.78 million, down 9 percent from November 1984 but up 4 percent from two years ago. Net placements of 1.70 million were down 7 percent from 1984 but 7 percent above 1983. **OTHER DISAPPEARANCE** totaled 76 thousand compared with 121 thousand during November of 1984 and 1983.

Percentage of Labor Force in Agriculture



1980 data.
Source: World Development Report 1983, World Bank.

EGG PRODUCTION DOWN

Montana poultrymen produced 48 million eggs in the September-November quarter, 4 percent less than a year ago. The average number of layers on hand during the final quarter of 1985 was up nearly 3 percent from last year at 810,000.

The Nation's laying flock was down one percent from the same quarter last year with 278 million layers. Eggs produced in the September-November quarter was also down 1 percent at 17.0 billion.

MONTANA LIVESTOCK SLAUGHTER

Commercial red meat production in Montana totaled 1.8 million pounds in November, 22 percent less than October and only 18 percent of November last year.

Cattle slaughter was 2,500 head compared with 15,000 last year. Hog kill totaled 2,600 compared with 13,000 in November 1984.

NATIONAL SLAUGHTER

Commercial red meat production for the United States in November 1985 totaled 3.12 billion pounds, down 6 percent from November 1984. January-November red meat production at 36.0 billion pounds, was up fractionally from last year. The 1985 accumulated production percentage changes by individual components were: beef, up 1; veal, up 3; pork, virtually unchanged; lamb and mutton, down 6.

Kill days for November 1985 included 21 weekdays (two were holidays) and five Saturdays. Kill days for November 1984 consisted of 22 weekdays (two were holidays) and four Saturdays.

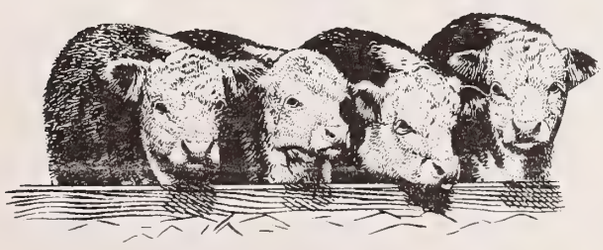
Comparing November 1985 with November 1984:

BEEF PRODUCTION, at 1.81 billion pounds, was down 6 percent. Cattle kill totaled 2.81 million head, down 9 percent. The average live weight increased 30 pounds to 1102.

VEAL PRODUCTION, at 42 million pounds, was down 2 percent. Calf slaughter totaled 288 thousand head, down 4 percent. Live weight averaged 249 pounds, 7 pounds heavier than last year.

PORK PRODUCTION totaled 1.24 billion pounds, down 7 percent. Hog kill totaled 7.01 million head, down 8 percent. Average live weight increased 2 pounds to 248.

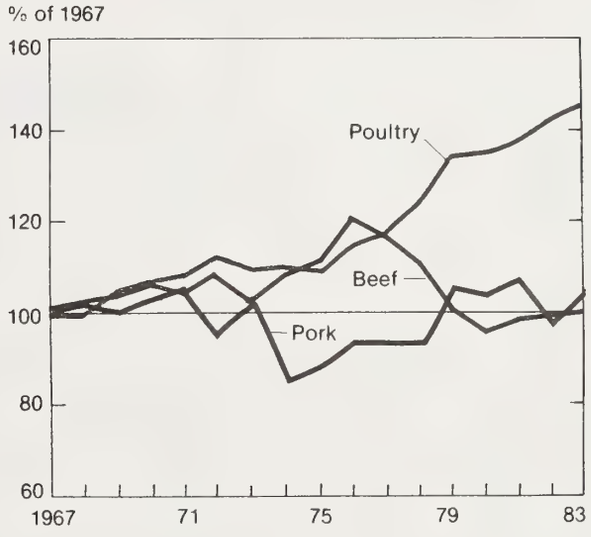
LAMB AND MUTTON PRODUCTION, at 28 million pounds, was down 7 percent. Slaughter totaled 476 thousand head, down 12 percent. Live weight averaged 116 pounds, 3 pounds heavier than a year earlier.



FARM MACHINERY UPDATE

Domestic demand for new farm machinery has fallen sharply this year, continuing a trend started in 1980. Purchases of new machinery, particularly four-wheel-drive tractors and self-propelled combines, have been a casualty of the weak farm economy. Dealers continue to offer incentives to spur new sales. But, with record crop production and weak export demand driving down crop prices, U.S. farmers are expected to purchase even less new machinery in 1986.

Per Capita Consumption of Meat



BULLETIN NOW AVAILABLE

The 1985 issue of **Montana Agricultural Statistics** has been published and is available for distribution. This issue includes county statistics (1983 and 1984) on Montana crops and livestock as well as state statistics for the past ten years.

Cost of the publication is $5.00, but is free to farmers and others who furnish data for input to the publication.

Address requests for the publication to:

Montana Crop & Livestock

featuring . . . . . MISSOULA COUNTY

Missoula County is located midway between the north and south state boundaries in west central Montana. The Idaho-Montana boundary defines the southwestern corner of the county's border. The landscape is largely mountainous and encompasses half of the Seeley-Swan valley in the north, and a portion of the Bitterroot Valley in the south. A major part of the Lolo National Forest lies within the boundaries of Missoula County. The Blackfoot River flows west through the center of the county, while the Bitterroot River and Rock Creek enter from the south. All three join the Clark Fork River at Missoula.

While not a major agricultural area because of limited farm land, Missoula County does have a variety of agricultural interests. The major crop produced in the county is hay. Other crops include oats, barley, winter and spring wheat, and some corn. Most of the cropland is irrigated, and the 1982 Census of Agriculture shows there were 443 farms in the county at that time.

Sheep, cattle, and hogs ranking 49th, 50th, and 52nd, respectively, are all produced in the area. Sales of livestock and livestock products brought in $5,176,000 to Missoula County in 1983. Crop receipts added $1,892,000, while government payments came to $216,000. This brings the cash receipt total for 1983 to $7,284,000.

WHEAT SITUATION

The 1985/86 marketing year is almost half over, having brought near-record supplies, the slowest export pace in a decade, reduced domestic use, and the lowest prices in 7 years. Farm prices that have sunk 11 percent below the loan rate have encouraged eligible producers to place much of their 1985 wheat under CCC loan.

As of November 1, outstanding loans covered over 672 million bushels of new-crop wheat and 48 million bushels from prior seasons. If prices remain below the loan rate for an extended period--and they may stay low even into the 1986/87 season--a large portion of these loan stocks will likely be added to CCC inventories. Combining these forfeited stocks with another 660 million bushels now in the farmer-owned reserve program and the nearly 500 million in CCCs current inventory would mean that literally all of the wheat stocks at the end of this season would be isolated from the market.

As free stocks of wheat tightened, harvest-depressed wheat prices posted some gains in October, but they still were below the loan level. Accelerated export sales could help bolster prices in the short run. The longer-term price outlook focuses on 1986 wheat seedings, program participation, and establishment of the 1986 loan rate in the farm bill. For the 1985/86 season, the farm price will likely fall between $3.00 and $3.20, below last year's $3.38 a bushel.

SEASON'S GREETINGS

This is the time of year when many of us pause and reflect on the problems of the past year and try to contemplate and foresee what next year will bring. This has been a very tough year for farmers and ranchers. Wheat production was the lowest in over 40 years and grazing conditions were comparable to the drouth years of the 1930s. Prices farmers are now receiving for their products when compared with costs of interest, fuel, fertilizer, machinery and other inputs have reached a historic low. Many can't afford to continue to produce food under these circumstances. Even our family dairy farm in Wisconsin won't escape the squeeze-out. The farm has survived three generations, but is losing money at current prices, so next year the herd will be sold and my brother will move on to another job--out of farming.

This is only one of many hard choices that are being made based on today's economic situation. Even though these changes are heart wrenching and difficult to accept, they must be kept in perspective. We're all fortunate to live in a land where many choices and opportunities exist. We must also keep in mind that families and friends are more important in the long term than farms and businesses.

These stressful and troubled times have also resulted in a sharp increase in requests for information about crop and livestock production. Our job is to serve you by collecting and publishing this information. We sincerely thank each of you who voluntarily takes time to answer our requests for survey information whether by mail, phone or personal interview. Accurate, reliable information depends on your excellent cooperation.

We wish you all a Merry Christmas and a Happy New year!

Lyle Pratt,
State Statistician

SINCERE GOOD WISHES

FOR THE HOLIDAY SEASON AND THE NEW YEAR

MONTANA DAIRY PRODUCTS

Montana dairy plants produced 327,000 pounds of creamed cottage cheese in October--11 percent less than the previous month and 41 percent below October 1984. Ice cream production was up 15 percent from September and was nearly 1 percent above October last year. Butter followed its seasonal pattern and moved up 48 percent from September but was 2 percent below last year. American cheese moved up 1 percent from the previous month and was 18 percent above October 1984.

MONTANA 1985 FERTILIZER USE FALLS 18 PERCENT

Montana farmers used 382 thousand tons of fertilizer in the year ending June 30, 1985. This is an 18 percent drop from last year and the lowest since 1981.

Nationally, consumption was down 2 percent. Inspite of the overall reduction, nitrogen consumption was up 4 percent.

NOVEMBER FARM PRICES

The Montana index of prices received by farmers for all farm products during mid-November was 145 percent of the 1977 base. The index was up 1 point from both last month and last year's level. The all crops price index at 155 was 6 points above October, but only 2 points above November 1984. The livestock and products index at 136 was 4 points below October, and the same as a year ago.

All grain prices increased from October to November. All livestock items except beef cows and hogs also went up, while hay prices held steady.

Nationally, the November index of prices received by farmers for all farm products increased 3 points from October to 126 percent of its 1977 average. Higher prices for cattle, broilers, corn, strawberries, and oranges were partially offset by lower prices for lemons, hogs and grapefruit. The index was 10 points below a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes, and farm wage rates for November was 163 percent of its 1977 average. The index was 1 point higher than October but 1 point lower than November 1984. Contributing most to the increase from last month were the feed and feeder livestock components.

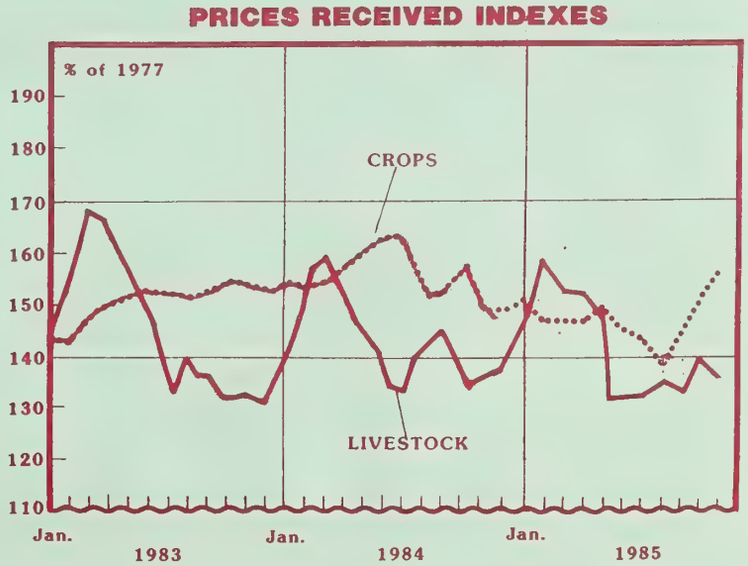
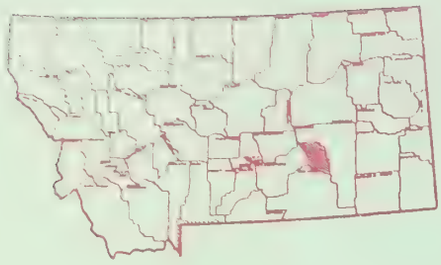
MONTANA CROP & LIVESTOCK PRICES RECEIVED INDEXES



featuring. . . . . TREASURE COUNTY



Treasure County occupies 624,140 acres of land in south central Montana. The landscape of the county is level and gently rolling. The Yellowstone River traverses the center of the county from west to east. Approximately 36,000 acres are devoted to cropland, with nearly 20,000 of these acres irrigated.

A variety of crops can be found growing in Treasure County, including winter and spring wheat, barley, oats, hay, and dry beans. It is also one of the major corn producing counties in the state.

Treasure County has as much interest in livestock as it does in crop production. Cattle, sheep and hogs are all raised in the area.

Cash receipts for 1983 for Treasure County totaled $11,990,000. $5,120,000 of this was contributed by livestock receipts, and $6,272,000 was contributed by crop receipts. Government payments added the remaining $598,000.

Hysham is the county seat and this area has an annual average precipitation of 12.77 inches. Normally, there are 121 frost free days for the area.

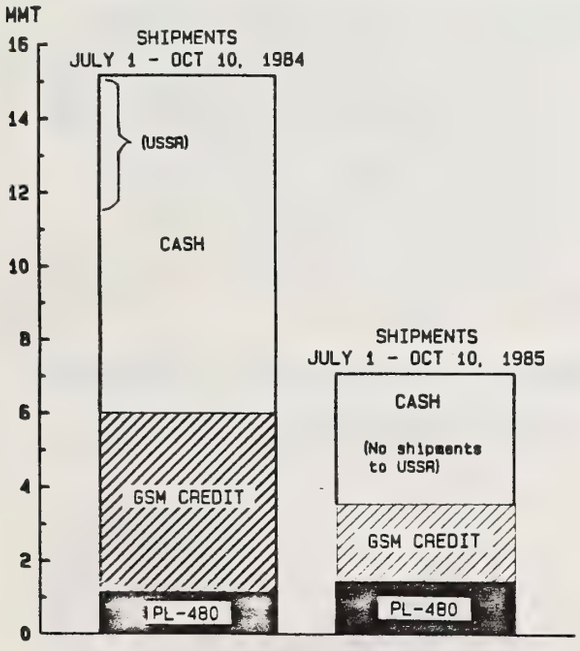
U.S. WHEAT AND WHEAT FLOUR EXPORTS
RECENT VS. YEAR-AGO RATES



NOTE: Credit and PL-480 quantities are estimated.

WHEAT EXPORT HIGHLIGHTS

As of October 10, U.S. wheat exports lag behind last year's level at this time by over 50 percent, or by about 8 million tons. Nearly 6 million tons of this decline is due to reduced cash exports, including a drop-off of nearly 4 million tons of exports to the Soviet Union. U.S. wheat exports to China, the Middle East, and Western Europe also lag considerably behind last season's exports. Another indication of the lack of competitiveness of U.S. wheat is the growing trend for many countries to not fully utilize available GSM financing. In FY 1984 nearly all announced programming was utilized, while in FY 1985 only about 50 percent of announced programs actually resulted in exports.

EXPORT FORECAST: The 1985/86 U.S. wheat export forecast fell sharply because of depressed world import demand, ample competitor supplies and lagging sales to a number of destinations. Accumulated exports and commitments through October 17 were 13.5 million metric tons as compared to 27.3 million tons one year before. It is especially notable that there are still no 1985/86 exports to the Soviet Union, while last year at this time accumulated exports to the USSR had reached nearly 4 million tons.

SHIPMENTS AND SALES: Wheat shipments in the 4-week period ending October 17 totaled 2.2 million tons, up almost 25 percent from last month, but over 50 percent behind last year's level.

Sizeable purchases of U.S. wheat by Korea, Algeria, Taiwan, and Pakistan, as well as the first sizeable sales to the Soviet Union (150,000 tons) since October 1984, were the month's highlights for U.S. wheat exporters.

Montana State Library
3 0864 1006 7753 6

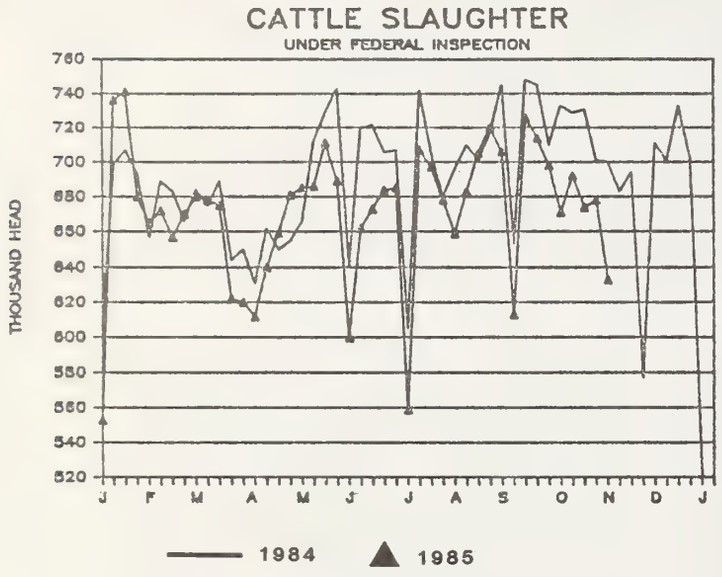
RED MEAT PRODUCTION INCREASES

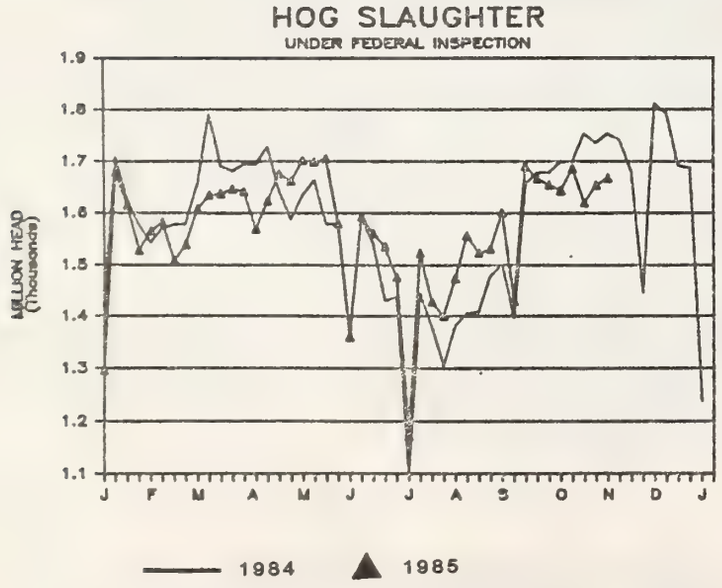
Commercial red meat production in Montana totaled 2.3 million pounds in October, 20 percent more than September but only 29 percent of October last year.

Cattle slaughter was 3,000 head compared with 9,600 a year ago. Hogs killed in Montana packing plants amounted to 3,700 head compared with 17,600 in October 1984.

Nationally, red meat production totaled 3.55 billion pounds in October, 9 percent more than September but 3 percent less than last year.

January-October red meat production was 32.9 billion pounds, 1 percent more than the same period in 1984. The 1985 accumulated production percent changes by individual components were: beef up 1 percent; veal up 3 percent; pork up 1 percent; lamb and mutton down 6 percent.



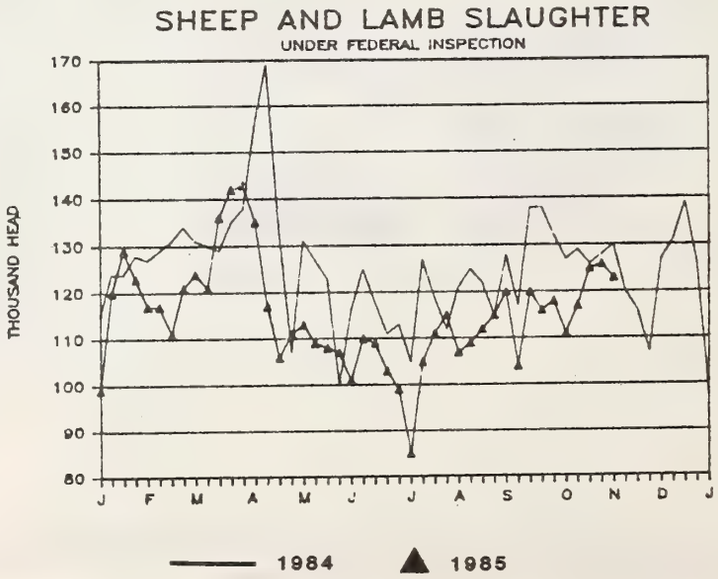


NUMBER OF HIRED WORKERS DOWN, WAGES UNCHANGED

A total of 3.1 million people were working on farms and ranches in the United States during the week of October 6-12. Included were workers hired directly by the farm operators and agricultural service employees who were working on farms. In October 1985, there were 3.3 percent (106,000) fewer people working on farms than in a corresponding week a year earlier. Hired workers represented 38 percent (1.2 million) of the total. Of these workers, 1.0 million were hired directly by operators of farms and ranches, 1.0 percent fewer than a year earlier. Farm operators and other unpaid workers who worked 15 hours or more accounted for 1.9 million workers, 4.6 percent below October last year.

The all hired farm worker wage rate in October was $4.56 per hour, unchanged from a year earlier. Workers paid on an hourly basis averaged $4.41, down 4 cents from October 1984. Wage rates for other categories of workers were: field $4.47; livestock $4.24 and piece-rate $5.51. Seasonal increases in wage rates from July were: all hired workers 32 cents; hourly 23 cents; field 40 cents; livestock 27 cents and piece-rate 78 cents.

Dry weather conditions during the survey week in most areas enabled farm operators to spend long hours in the fields harvesting crops and finishing up fall field activities. The self-employed farm operators worked an average of 47.9 hours, 4.8 hours more than during the comparable week in 1984. Other unpaid workers averaged 38.6 hours for the week, 2.2 hours more than in October 1984. The average work week for the hired workers was 1.6 hours less than a year earlier at 38.6 hours.



FARM ELECTRICITY and TELEPHONE COSTS

Montana farmers and ranchers paid 20 percent more for electric service in mid-1985 compared with a year ago. The average electric bill of $77 for one month represents an increase in usage and a 13 percent increase in cost per kilowatt hour.

Telephone bills were slightly lower with an average of $58.00 compared with $59.60 last year.

Nationally, farmers and ranchers paid an average mid-summer electric bill of $104 in 1985 which was 6.1 percent above the 1984 average of $98. Fuel adjustment costs and taxes are included in the electricity costs. The average cost per kilowatt hour (KWH) was 7.17 cents compared with 6.83 cents in 1984, a 5 percent increase. Usage of electricity averaged 1450 KWH per month in 1985 compared with 1440 KWH a year earlier. Costs per KWH were lowest in Washington at 4.2 cents followed by Idaho (4.6), Oregon (4.7), Tennessee (5.1), and Montana (5.2). Highest rates per KWH were reported in New Jersey (10.7 cents) followed by Connecticut at 9.7, New Hampshire (9.4) and Rhode Island (9.3).

Telephone service for farms and ranches averaged $43.90 per month in 1985, unchanged from last year. Charges for local service, long distance and extension phones were included in the monthly telephone bill. This year local service averaged $16.40 per month which was 80 cents higher than last year.

HAPPY THANKSGIVING!

CATTLE ON FEED IN 7 STATES DOWN

Cattle and calves on feed November 1 for the slaughter market in the 7 states preparing monthly estimates totaled 7.56 million head, down 8 percent from a year ago and 2 percent below November 1, 1983.

MARKETINGS of fed cattle during October totaled 1.57 million, 5 percent below last year and 3 percent less than October two years ago.

PLACEMENTS of cattle and calves on feed in the 7 states during October totaled 2.78 million, up 9 percent from last year and 13 percent above October 1983. This is the highest October placement total since 1978. Net placements of 2.69 million for October were 11 percent above last year and 14 percent above October 1983.

OTHER DISAPPEARANCE totaled 85 thousand head, compared with 110 thousand during October 1984 and 102 thousand during October 1983.

RED MEAT & POULTRY

Total red meat and poultry output is expected to decline about 2 percent in 1986, but remain large by historical standards. An anticipated 4 percent rise in poultry production will partially offset a 5 percent decline in red meat. Large supplies of relatively lower priced poultry products will likely hold down price increases for red meats. Improved but still sluggish economic growth will also temper price gains.

This year, record large red meat and poultry supplies, combined with slow economic growth, have resulted in sharply lower prices to producers and declining consumer prices. Total meat supplies are being augmented by increased poultry production, and by larger marketings of female stock by hog and feeder cattle producers.

Red meat supplies this spring and summer were much larger than expected due to record-high slaughter weights for fed cattle since spring. Beef cow and sow slaughter has been large due to liquidation of breeding herds. However, slaughter of breeding stock has declined sharply since spring.

This fall's large grain harvest and expected lower feed prices may encourage further poultry expansion. Although there is little evidence of expansion in the hog and cattle sectors, lower feed costs and some price improvement could encourage the retention of some young female stock. For the year, however, total meat supplies may rise about 1 percent from 1984 with poultry production advancing 5 percent and red meat output remaining virtually unchanged from levels of the past two years.

featuring. . . . . TETON COUNTY

Teton County is located in north central Montana on the eastern slope of the Rocky Mountains. The section of land along the western border of the county embraces this continental range. The North Fork of the Sun River comprises most of the western and southern borders of the county. The Teton River, formed by Deep Creek and Muddy Creek coming together, begins in the northeastern corner and continues east out of the county to join the Missouri River. The 1,456,179 acres of the county's landscape consists of rolling lowlands and bench prairie, hills, and mountains.

Teton County is a major crop production area in the state. In 1984 crop production the county ranked 2nd in barley, 3rd in winter wheat and 5th in durum wheat among the 56 counties in Montana. Places of 14th for all hay, and 18th for spring wheat production were also recorded in 1984 for Teton County. Nearly 20 percent of the crops are grown on irrigated land in this area.

The 1982 hog inventory showed Teton County in 10th place among the hog raising counties. In the 1983 cattle and sheep inventories the county came in 18th and 21st, respectively.

Cash receipts for crops raised in the county in 1983 totaled $35,083,000, while receipts for livestock came to $21,404,000. Government payments ended up at $9,596,000, making a total cash return of $66,083,000 for Teton County in 1983.

LESS GRAIN IN STORAGE
FARM PRICES FOR OCTOBER
PASTURE & RANGE CONDITION
FARM ENERGY USE

MONTANA WHEAT STOCKS DOWN

Montana wheat stocks held in all storage positions October 1 were down 25 percent from a year ago. The total at 117.8 million bushels is the lowest October 1 wheat stocks since 1974. Wheat stored on farms was 72 percent of the total and was down 33 percent from last year. Commercial off farm storage held the remainder and was up 7 percent. Disappearance of wheat from storage since June 1 was 27.6 million bushels, down 31 percent from a year ago.

Winter wheat at 70.6 million bushels was down 26 percent from last year. All spring wheat (including durum) at 47.2 million bushels was down 24 percent. Durum at 8.1 million bushels was down 21 percent.

Barley stocks in all positions totaled 35.3 million bushels, down 37 percent from last October 1. Oats at 4.3 million were down 12 percent.

1/ These stocks are included in the October 1 total stocks estimates.

NATIONAL GRAIN STOCKS HIGHLIGHTS

Nationally, all wheat stored in all positions on October 1, 1985 totaled 2.93 billion bushels, 7 percent more then the 2.74 billion bushels on hand October 1, 1984, but 1 percent less than the October 1, 1983 stocks. Wheat stored off-farm is 1.72 billion bushels, or 59 percent of the total wheat stocks. Farm stocks amount to 1.21 billion bushels. Farm stocks are fractionally below october 1, 1984, while off-farm stocks are up 13 percent. Indicated disappearance of all wheat during June-September 1985 amounts to 909 million bushels, 27 percent less than the 1.25 billion bushels disappearance during the same period a year ago.

Durum wheat stocks in all positions on October 1, 1985 totaled 163 million bushels, down 8 percent from the 177 million bushels stored on October 1, 1984. Farm stocks total 119 million bushels and are 5 percent less than October 1 a year ago. Off-farm stocks of 44.1 million bushels are down 15 percent from last October 1. Indicated disappearance from all storage positions during June-September 1985 is 42.4 million bushels, up 66 percent from the same period in 1984.

Barley stored in all positions on October 1, 1985 totaled 654 million bushels, 14 percent more than on October 1 a year earlier and 27 percent more than on October 1, 1983. Of the total barley stocks on hand October 1, 1985, 71 percent, or 463 million bushels, was stored on-farm. Farm stocks are 15 percent above a year earlier. Off-farm stocks, of 191 million bushels are up 11 percent from October 1, 1984. Indicated disappearance during June-September 1985 was 192 million bushels, 10 percent less than the corresponding period a year ago.

OCTOBER AG PRICES

The Montana index of prices received for all farm products at 142 was up 4 points from September, but down 3 points from October 1984. The all crop price index at 146 compares with 143 in Septembet and 157 a year ago. The livestock price index at 138 was up 4 points from both September and last October.

Most grain prices, except for barley, registered increases from the previous month. Livestock prices except for hogs, steers and heifers were lower than September.

Nationally, the October index of prices received by farmers for all farm products increased 2 points from September to 123 percent of its January-December 1977 average. Higher prices for cattle, nogs, milk, turkeys, and cotton were partially offset by lower prices for broilers, corn, grapefruit, and soybeans. The index was 15 points below a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes, and farm wage rates for October was 162 percent of its 1977 average. This was unchanged from a month earlier but 1 point lower than in October 1984. A decrease in the feed component from a month ago and the normal seasonal decline in the fertilizer component were offset by increases in the feeder livestock and family living components.

UNITED STATES INDEX SUMMARY

INDEX	Oct. 1984	Sept. 1985	Oct. 1985

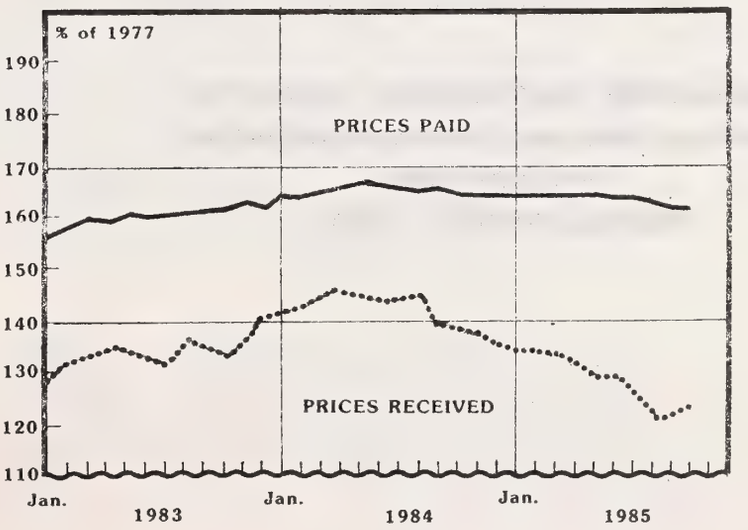
UNITED STATES INDEX NUMBERS OF PRICES PAID & PRICES RECEIVED



FARM ENERGY US(

Although farm energy use constitutes only a small fraction of total U.S. energy use, it is a very critical farm input. Even though energy supplies have been plentiful and energy prices have been moderate in recent years, farmers have continued to adopt energy-conserving techniques to reduce their operating costs.

Farm energy use in 1985 is expected to decline 2 percent. The projected decline is largely due to continued improvements in farm production technology designed to achieve reduced energy use per unit of output. These improvements include adoption of energy-conserving practices in tillage and crop drying. The reduction in energy use also reflects a slight reduction in acreage planted in 1985.

On-farm gasoline use has continued to decline while LP gas use changed little. Diesel use, however, continues to increase relative to both gasoline and LP gas as older gasoline-powered machinery is replaced by new diesel-powered machinery. Farm use of gasoline has declined 9 percent, whereas diesel fuel and LP gas use have remained unchanged from year-earlier levels.

Farm Fuel Use

PASTURE & RANG(N) CONDITION

Pasture and range growth during October was essentially stopped because of frequent nighttime frosts. Limited grazing is still available but forage is very light because of earlier drouth. Ranchers are also utilizing hay fields and grain stubble in order to conserve short hay supplies. About 90 percent of all livestock have been moved from summer ranges by the end of October.

WHEAT HIGHLIGHTS

The U.S. wheat harvest, probably the smallest in 5 years, is nearing completion. The smaller crop, down 195 million bushels from 1984, will provide 1985/86's marketing season with the lowest supplies in the last three seasons. The 1985/86 marketing year began with a June 1 carryin totaling 1.42 billion bushels, compared with 1.40 billion a year earlier. All of the rise over last year resulted from near record Hard Red Spring stocks, up 19 percent from a year earlier, and record Soft White wheat, up 4 percent. Hard Red and Soft Red Winter wheat inventories declined, while Durum was about unchanged.

Expanded use of the wheat loan program and expectations of large 1985 corn and sorghum harvests will dampen wheat feeding and cause an estimated 15 percent decline in 1985/86 feed use. The high-valued dollar and large foreign wheat crops will hinder this season's exports, causing overseas loadings to decline 19 percent from a year ago, to the smallest volume in 8 years. These projections reflect the sharpest season-to-season decline in wheat use in over 10 years. Lower use will in turn lead to higher stocks when the 1986/87 marketing year begins.

Despite the smaller harvest, 1985/86 wheat prices will be influenced by the near record 1985 world crop and record stocks. The season average U.S. farm price is expected to fall to between $3.05 and $3.25 a bushel, compared with last season's $3.38.

World wheat production in 1985/86 is forecast at 506 million tons, down 8 million from the record last year. The production forecast for the four major foreign exporters was down 4.5 million tons from last month. The outlook in the EC has been hurt by persistent and heavy rains at harvest across northwest Europe. Australian prospects have been hurt by weather; extended dryness before and during the planting will put harvested area at the lowest level in 3 years. Drought in Canada during June and July, and rains at harvesttime have reduced yield prospects in Alberta and Saskatchewan. Also, reduced plantings and yield prospects will likely result in a decline in Argentine output this year.

India has harvested another bumper wheat crop and is seeking to export its surplus. A severe shortage of covered storage is prompting India to make at least 2 to 3 million tons available for export. Although 500,000 tons have already been sold to the Soviet Union, Vietnam, and Romania, recent discussions with Pakistani and Soviet purchasing authorities have apparently been unsuccessful. India's problems in selling wheat include: high domestic support prices (around $130 per ton), a lack of bulk handling facilities, and complaints from the Soviet Union about the quality of last year's shipments.

MILK PRODUCTION UP

Montana's July-September milk production at 95 million pounds was 8 percent above last year. Average milk production per cow, at 3,400 pounds, was up 5 percent over last quarter as dairymen fed more grain and concentrates to their cows. Montana's dairymen fed an average of 15 pounds of grain and concentrate per head per day, up from 14 pounds last quarter. The cost per hundredweight of this feed at $6.90/cwt was down an average of 20 cents.

Nationally, milk production during the third quarter totaled 36.7 billion pounds, a record high for that period and 10 percent more than the same period in 1984. Accumulated milk production for the first 9 months of 1985 totaled 108 billion pounds, up 4 percent from the same period in 1984. Production per cow averaged 3,299 pounds for the quarter, 203 pounds above the same quarter in 1984. The total number of milk cows in herds averaged 11.1 million head during the quarter, 3 percent above the same quarter a year ago.

SEPTEMBER LIVESTOCK SLAUGHTER

Commercial red meat production in Montana during September totaled 1.9 million pounds, down 15 percent from a month earlier. The January-September accumulated total at 22.8 million pounds is down 39 percent from the same period a year ago. Cattle slaughter in Montana packing plants during September was 2,500 head. The January-September total at 32,100 head is down 43 percent from last year. Hog slaughter was 3,000 head. The January-September total at 23,200 head was down 34 percent from last year.

Nationally, commercial red meat production for the United States in September 1985 totaled 3.25 billion pounds, up 5 percent from September 1984. January-September red meat production, at 29.3 billion pounds, was up 2 percent from last year. The 1985 accumulated production percentage changes by individual components were: beef, up 2 percent; veal, up 4 percent; pork, up 1 percent; lamb and mutton, down 6 percent.

ANNUAL FALL SURVEY GETTING UNDERWAY

The Montana Crop and Livestock Reporting Service has been making monthly production forecasts throughout the 1985 crop year for the major crops. Now that the harvest season has essentially ended, about half of Montana's 23,600 farmers and ranchers will be asked to participate in a survey during November to obtain final 1985 figures on acreage, yield and production. A sample of producers who fail to respond by mail will be contacted by telephone to assure adequate coverage and accurate results.

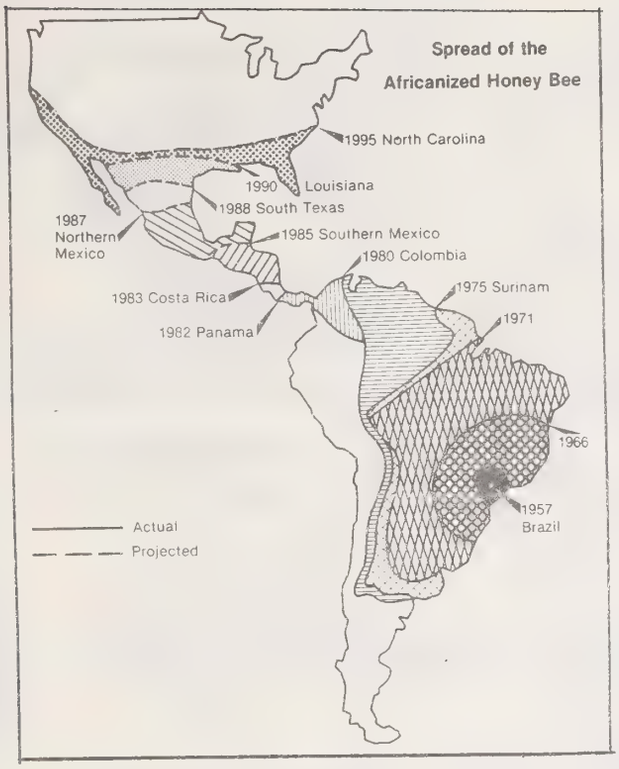
State and county estimates are developed from this annual acreage and production survey. These figures are important in providing an accurate picture of crop production for each county and for Montana. Similar surveys will be conducted in other states and final state and national survey results will be published January 10, 1986.

RELEASE DATES FOR 1986

There have been some changes made in the U.S.D.A.'s Crop Reporting Board release dates for 1986. Major reports will be issued on the following dates in 1986.

CROP PRODUCTION (Monthly)	Jan. 10, Feb. 10, Mar. 10, Apr. 10, May 9, Jun. 10, Jul. 11, Aug. 12, Sept. 11, Oct. 10, Nov. 10, Dec. 10
SMALL GRAINS (Annual Summary)	Jan. 10
CROP PRODUCTION (Annual Summary)	Feb. 10
GRAIN STOCKS	Feb. 10, Apr. 29, Jun. 27, Sep. 29, Oct. 30
CATTLE INVENTORY	Feb. 10, Jul. 25
PROSPECTIVE PLANTINGS	Feb. 18
HOGS AND PIGS	Mar. 21, Jun. 23, Sep. 22, Dec. 22
CATTLE ON FEED	Jan. 24, Feb. 14, Mar. 14, Apr. 25, May 15, Jun. 16, Jul. 25, Aug. 15, Sep. 15, Oct. 24, Nov. 14, Dec. 15

The Crop Reporting Board calendar and a catalog covering all releases scheduled for 1986 will be available free in early December. For copies, write Crop Reporting Board Publications, Room 5829 South, USDA, Washington, D.C. 20250, or call (202) 447-4021.



1985 FARM INCOME UPDATE

With both net cash income and net farm income expected to decline, the 1985 U.S. farm economy will probably continue sluggish. Commodity prices are forecast to drop, leaving total cash receipts well below 1984. Crop cash receipts should come near last year, as lower prices just offset increased production. Livestock receipts, however, are expected to fall well short of 1984.

Although PIK disbursements ended earlier this year, total direct Government payments could approach 1984 levels. Cash payments are expected to show a dramatic increase, partly because of advanced deficiency payments for 1985 crops. A decline in gross cash income should be tempered somewhat by lower production expenses. Net cash income is forecast to fall to between $35 and $40 billion, following 1984's $39.2 billion. In constant (1972) dollars, net cash income is expected to total $15 to $17 billion, down from last year's $17.5 billion.

NET FARM INCOME OFF

Net farm income for 1985 is forecast at $23 to $27 billion, compared with $34.5 billion in 1984. Deflated net farm income ($1972) should range between $10 and $12 billion, compared with $15.5 billion last year. Part of the drop can be attributed to an anticipated decline in livestock receipts and inventories. Net cash flow, the cash available for business operation, real estate purchases, and household consumption, will likely also continue to fall.

AFRICANIZED HONEY BEES THREATEN U.S.

Africanized honey bees are now in Central America and are expected to reach Mexico late this year, according to USDA estimates. When the bees do settle here, the annual financial loss facing U.S. beekeepers could range from $26 million to $58 million.

Africanized bees were first brought to this hemisphere from Africa in 1956 by a group of Brazilian scientists. Reportedly, 26 swarms later escaped from laboratories near Sao Paolo, Brazil and have been multiplying ever since.

They are characterized by their aggressive hive defense, stinging, robbing and marauding survival tactics. In tests, they produced six to eight times more stings per colony than domestic bees. Although more aggressive than domestic bees, individually their stings are no more painful or serious. Africanized bees are noteworthy for excessive swarming--a major reason for production losses. They often abscond--an entire colony leaves a nest to hunt for a new location. Their piracy of other colonies may spread disease and parasites.

Rough estimates suggest that Africanized bee colonization mainly would be in areas of southern states with 240 frostfree days, but a somewhat more precise measure is where 60 degrees F. is the mean high temperature for the coldest month, January. That means Africanized bees could settle along the two coasts through part of California, and part of North Carolina, and across the country in parts of the states of Georgia, Alabama, Mississippi, Louisiana, Texas, New Mexico, Arizona, South Carolina, and most of Florida.

Bees--all types--pollinate at least 100 crops. They may account for 80 percent of pollination, being primary pollinators of about $5-$6 billion in fruit, vegetables, seeds and fiber produced annually. They also are primary pollinators of seed which annually produces $4-$5 billion worth of alfalfa hay, which is a significant factor in cattle, calf and milk production.

The Africanized bee would interbreed with domestic honeybees that pollinate these valuable crops. The result of this cross could be a bee that is more aggressive and produces less honey.

featuring. . . . . . LAKE COUNTY

Lake County is located in the northwestern section of Montana. The upper portion of the county is occupied by beautiful Flathead Lake. The lake is about thirty miles long, and from five to ten miles in width with a rugged, wooded shoreline. Outside of the Great Lake System, Flathead Lake is one of the largest inland lakes in the United States, and is famous for the abundant cherry crop grown along its shore. The rest of Lake County is comprised almost entirely of the Flathead Indian Reservation. The Flathead is the main valley and it lies between the Mission Mountains on the east, and the Little Bitterroot Mountains on the west. The outlet of Flathead Lake, the Flathead River, traverses the center of the county and runs along the southwestern border of Lake and Sanders counties.

Livestock production is a main industry in Lake County as it ranked 12th in hog numbers on December 1, 1982, and 16th in the cattle inventory on January 1, 1983. Lake County came in 28th place for sheep numbers on January 1, 1983.

Crop production is a major agricultural concern in Lake County. All hay and Oats production brought the county rankings of 5th and 6th, respectively, in 1984 crop production. Lake County is one of the major potato producing areas in the state. Barley, spring wheat, and winter wheat are also grown in the area.

Cash receipts for livestock totaled $19,173,000 in 1983, while crops added $11,355,000. Government payments came to $1,208,000 for a total cash return of $31,736,000 for Lake County in 1983.

HIGHLIGHTS:

OCTOBER 1 CROP FORECAST
ALFALFA SEED CROP DOWN
SEPTEMBER AG PRICES
PASTURE & RANGE CONDITION
IMPROVED

NATIONAL HIGHLIGHTS

Nationally, all wheat production is forecast at 2.42 billion bushels, 7 percent less than 1984 but essentially the same as 1983. Durum production is expected to be 2 percent above 1984, and 45% above 1983. Hard spring wheat production is 10% above 1984 and 32 percent more than 1983. Winter wheat production is expected to be 11 percent below 1984 and 7 percent below 1983.

Production of barley is forecast to be slightly above 1984 and 18 percent above 1983. Production of corn for grain is expected to be 12 percent above 1984, and more than double the small 1983 crop.

OCTOBER 1 CROP FORECAST

The October 1 crop forecast for Montana small grains is mostly unchanged from a month earlier. The extended drouth during the major part of the growing season greatly reduced yields. Abnormal snow and rain in September made final harvest very difficult, and on October 1 some fields still awaited harvest. Production changes from 1984 and 1983 are as follows:

	1984	1983
Winter Wheat	down 70%	down 74%
Hard Spring Wheat	down 12%	down 44%
Durum Wheat	down 45%	down 52%
Barley	down 49%	down 61%
Oats	down 23%	down 43%
Corn for Grain	up 7%	up 8%
All Hay	down 27%	down 32%
Sugarbeets	up 106%	up 5%

Harvesting of late season crops has been slowed and frost damage has been extensive to this year's potato crop.

MONTANA CROP PRODUCTION FORECAST -- OCTOBER 1, 1985

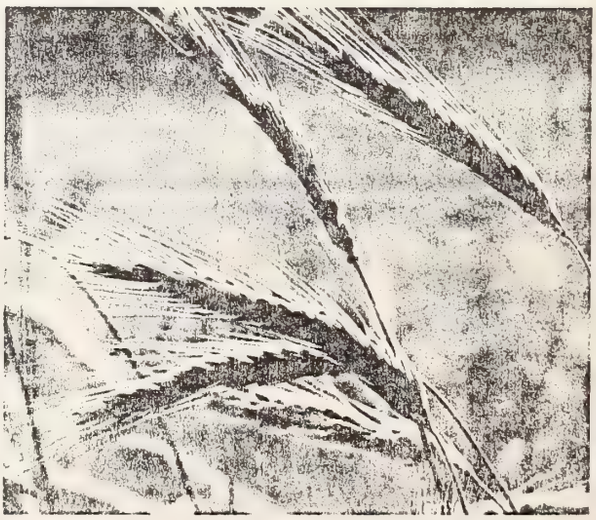
OCTOBER 1 ALFALFA SEED FORECAST

Montana alfalfa seed producers expect to harvest only 2.58 million pounds of clean seed in 1985, according to an October 1 survey of growers. This is down 17 percent from the September 1 forecast and 40 percent under a year ago. Acres for harvest at 12,000 are 57 percent under last year. Yield per acre at 215 pounds compares with 155 pounds a year ago.

Slightly over half of all harvested acres will be in private varieties, while Ladak 65, Vernal, and Common account for 10 percent each. About 80 percent of the harvested acreage is irrigated this year.

Harvest of the crop has been very difficult due to the wet and cold weather.



SEPTEMBER FARM PRICES

The mid-September index of prices received by Montana farmers and ranchers was 1 point above the previous month at 137 percent of the 1977 average. Compared with a year ago the index is down 11 points.

The majority of individual crop and livestock items were down from last month but winter wheat, other spring, wheat, all beef cattle, sheep and eggs were up. These are important items with considerable weight in the Montana index computation.

Prices for most commodities remain much below last year. The only items above a year ago were hay, calves, sheep, lambs and eggs.

The September index of prices received by U.S. farmers for all farm products decreased 1 point from August to 120 percent of its January-December 1977 average. Lower prices for hogs, cattle, corn, onions and potatoes were partially offset by higher prices for broilers, eggs, lemons, grapefruit and oranges. The index was 18 points below a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates was 162 percent of its 1977 average. The index was down 1 point from last month and was 2 points lower than September 1984. The feeder livestock component was the major contributor to the decrease from last month.

OCTOBER PASTURE & RANGE CONDITION IMPROVED

Montana's pasture and range feed condition improved with cool, wet September weather and by October 1 the condition was 54 percent, 11 points above September 1. The current condition is 1 point above last year, but still 24 points below average.

Ranges have greened up but still provide limited grazing because of earlier drought. Nearly 65 percent of all cattle and calves were moved from summer ranges by October 1. Livestock are now grazing hay fields and grain stubble which has more than normal green growth from weeds and volunteer grain this year.

HOG INVENTORY DOWN

Inventory of all hogs and pigs on September 1, 1985, in the 10 states conducting quarterly hog surveys is estimated at 41.8 million head, 3 percent below last year and 9 percent below September 1, 1983.

--Breeding inventory, at 5.38 million head, is 3 percent less than a year ago, and 8 percent below two years earlier.

--Market hog inventory, at 36.4 million head, is 3 percent below September 1 last year and 9 percent less than September 1, 1983.

PIG CROP: The June-August 1985 pig crop was 16.9 million head, 1 percent below the corresponding period last year and 5 percent below two years ago. There were 2.19 million sows that farrowed during June-August, down 3 percent from a year earlier and 10 percent less than the same period two years ago. Sows farrowing during June-August 1985 averaged 7.73 pigs per litter compared with 7.60 last year and 7.36 during the comparable period two years ago.

FARROWING INTENTIONS: Hog producers in the 10 quarterly states intend to farrow 2.27 million sows during September-November of this year. This is 2 percent fewer than during the comparable period in 1984, and 5 percent below the 1983 period.

Farrowing intentions for December 1985-February 1986 quarter are 1.93 million head, fractionally below a year earlier and 2 percent below the comparable period two years earlier.

WHEAT and BARLEY MOVEMENT DROPS OFF

Montana wheat shipped to out-of-state destinations in December 1984 through May 1985 was 30 percent below the same period last year at 43.4 million bushels. Wheat originating in northwest and north central Montana showed the sharpest decline--shipments were off 37 percent. Movement by rail was down 35 percent and truck movement was down 7 percent.

Western destinations received 31 percent less wheat compared with last year, but eastern destinations showed a 3 percent increase. Other destinations, mostly south and southeast of Montana, showed a 50 percent increase.

Western destinations still received 94 percent of the total shipments, while east and other destinations shared nearly equal portions of the balance.

Montana barley shipped to out-of-state destinations December 1984 through May 1985 amounted to 10.8 million bushels, 56 percent less than a year ago. Rail movement fell off 64 percent, and truck movement was down 39 percent.

Barley going west was down 62 percent, eastern movement was down 21 percent and all other destinations were 51 percent below a year ago.

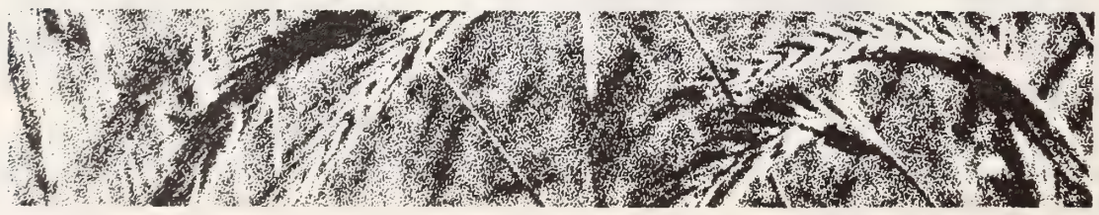
Grain Movement statistics are made possible through funds provided by the Montana Wheat Research & Marketing Committee through the Montana Department of Agriculture.



CATTLE ON FEED DOWN

Cattle and calves on feed September 1 for slaughter market in the 7 states preparing monthly estimates totaled 6.14 million head, down 9 percent from a year ago and 8 percent below September 1, 1983.

MARKETINGS of fed cattle during August totaled 1.70 million, 1 percent above last year and 3 percent more than August two years ago.

PLACEMENTS of cattle and calves on feed in the 7 states during August totaled 1.50 million, down 11 percent from last year and 5 percent below August 1983. **NET PLACEMENTS** of 1.44 million for August are 11 percent below last year and down 4 percent from two years ago.

OTHER DISAPPEARANCE totaled 62 thousand head, compared with 61 thousand during August 1984 and 88 thousand during August 1983.

RED MEAT PRODUCTION DOWN

Montana slaughter plants produced 2.3 million pounds of red meat during August. The August production was 12 percent higher than the previous month, but 60 percent lower than August 1984. Montana's total red meat production for the first eight months of the year was 33 percent below last year.

August slaughter consisted of 3,000 cattle and 2,900 hogs. In terms of total liveweight the cattle kill was down 62 percent, and the hog kill was down 63 percent from last year.

Nationally, commercial red meat production during August totaled 3.40 billion pounds, up 1 percent from August 1984. January-August red meat production at 26.1 billion pounds was also up 1 percent from last year. The 1985 accumulated production percentage changes by individual components were: beef, up 1 percent; veal, up 3 percent; pork, up 1 percent; lamb and mutton, down 7 percent.

MONTANA EGG PRODUCTION UP

Montana's laying flocks produced 4 percent more eggs during the June-August quarter compared with the same period last year. Production totaled 53 million eggs. The number of hens in the laying flock increased 5 percent and averaged 825 thousand for the quarter. The average rate of lay was down slightly.

The Nation's laying flocks produced 16.8 billion eggs during the June-August quarter, 1 percent less than during the same period in 1984. The number of layers averaged 271 million, 2 percent less than a year ago.

LOW PRICES, ERODING LAND VALUES HINDER CATTLE INDUSTRY

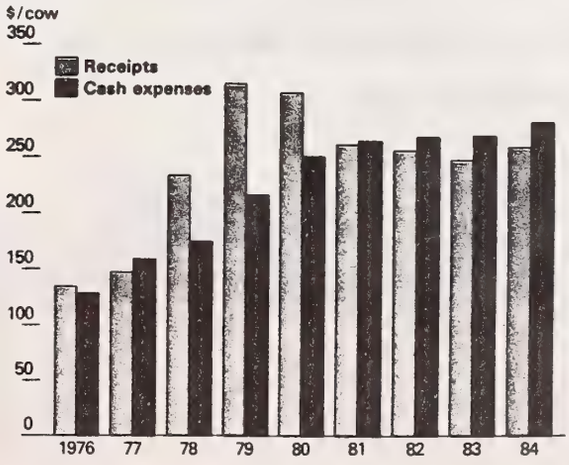
Severe cash flow problems caused by low prices and eroding land values have hindered the cow-calf sector of the cattle industry throughout the 1980s. The current cycle began with an inventory of 110 million head in 1979, but only increased to 115.4 million in 1982 before the expansion was choked by financial problems and drought-reduced forage supplies.

Since 1981, net returns (receipts less cash expenses) have fallen about $80 per cow in each of the four major cow-calf production regions. With rising fertilizer costs, net returns in the Southeast have been nonexistent since 1981. However, from 1980 to 1983, the Great Plains showed the largest decrease, which when combined with drought in 1983/84, resulted in a 7 percent decrease in the beef cow inventory in 1984. Differences in feed costs are a major factor causing variability in costs between regions.

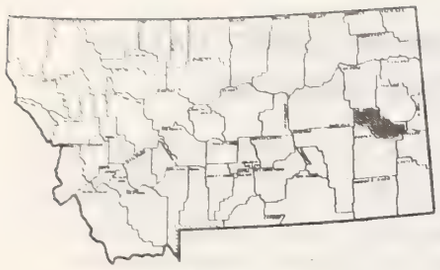
On January 1, 1985, the inventory was 109.8 million, down 3 percent from a year earlier and the lowest inventory since 1968. Beef cows numbered 35.4 million, down 6 percent from the previous year. In addition, the 1984 calf crop, at 42.5 million, was the lowest since 1963.

The cattle inventory will likely continue to decline through 1985 and 1986. Expansion may not be realized before 1988 and, then, only at a much slower pace than previous cycles. Not only has a large portion of the breeding herd been sent to slaughter over the past 4 years, but fewer heifers have been retained to replace the cows. In addition, calf crops each year have continued to decline. The January 1, 1986 inventory may fall to 106 to 107 million head.

Receipts in the U.S. Cattle Industry Fall Below Expenses in the 1980's



featuring. . . . . PRAIRIE COUNTY



Prairie County is divided in half by the Yellowstone River flowing from east to west through the county. The Powder River flows from the southeast to join the Yellowstone in the southwest corner of the county. The landscape of Prairie County is mainly the rolling prairie characteristic of most eastern Montana counties. The northwestern section of the county is broken, however, due to the Big Sheep Mountains that occupy that area. Prairie County covers 1,108,787 acres. Approximately 64 percent of the county consists of farm land.

Agricultural interests in the county include both livestock raising and crop production. In the January 1, 1983 cattle and sheep inventories, Prairie County ranked 34th and 30th, respectively. In the December 1, 1982 hog count, the county came in 31st among the hog raising counties. Prairie County livestock receipts totaled $8,848,000 in 1983.

Crops produced in the area include winter and spring wheat, oats, barley, and hay. Prairie County ranked 21st in winter wheat, and 43rd in spring wheat production in 1984. Oats produced in the county brought a ranking of 22nd among counties that produce that crop, while barley and hay production ranked 37th and 49th, respectively. Corn and sugarbeets are also grown in the county. Crop receipts totaled $5,439,000 in 1983. Government payments added $1,534,000 for a total cash return of $15,821,000 in 1983 for Prairie County.

PASTURE & RANGE CONDITION

Montana's pasture and range condition on September 1, at 43 percent is 11 points higher than the the August 1 condition. August was wet and cool and range grasses responded well although not nearly as well as if the rains had come earlier, before the grasses matured under an extreme drouthy environment.

However, the August rains did revive growth and restore green color although production is still very low. The limited growth has enabled ranchers to postpone some early marketing of cows and calves and also postponed some early feeding of hay.

MONTANA PASTURE & RANGE CONDITION SEPT. 1

STATE	73	54	43

MONTANA WHEAT PRODUCTION DOWN AGAIN

Montana's 1985 wheat production forecast as of September 1 is down 7 percent from last month at 52.1 million bushels. The new forecast is 50 percent less than last year's drought reduced crop and is the lowest production since 1940. The large drop in production from 1984 to 1985 follows 24 percent drops in each of the two preceeding years.

The 1985 winter wheat crop is expected to be down 70 percent, durum 50 percent, and other spring wheat wheat 12 percent from last year.

The State's barley production forecast, down 49 percent from a year ago, is unchanged from August 1. Harvested acres are down 29 percent and the yield fell 8 bushels per acre from last year.

Oats production is down 23 percent from last year, the result of 5 percent fewer acres and a 7 bushel decrease in yield.

Hay production is down 16 percent from last year's relatively small crop and 22 percent below two years ago.

Sugarbeet production more than doubled last year's production, but dry bean output is 57 percent less.

MONTANA ALFALFA SEED CROP DOWN

Montana alfalfa seed producers expect to harvest 3.1 million pounds of clean seed in 1985, 28 percent less than last year's crop. Production is below last year mainly because of drouth, grasshoppers, and the diversion of acreage to hay instead of seed. The forecast, funded by the Montana Alfalfa Seed Committee, is based on September 1 conditions.

This year's yield is forecast at 215 pounds per acre compared with 155 a year ago. The yield increased because much of the non-irrigated acreage will not be harvested for seed this year. Acres for harvest at 14,400 are 48 percent less than last year.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 221,000 gallons of ice cream in July, 21 percent more than in June, but about 1 percent less than July 1984. Creamed cottage cheese production at 497,000 pounds was 44 percent above the previous month, but 19 percent below a year ago. American cheese showed a change in the other direction with 516,000 pounds, 20 percent less than in June and 48 percent above the previous year.

featuring. . . . . FALLON COUNTY

Fallon County occupies 1,038,630 acres of prairie land in eastern Montana along the Montana/North Dakota border. It was created December 9, 1913 and has an average annual precipitation of 13.21 inches, based on observations at Plevna, Montana located near the center of Fallon County.

Dryland farming is the main interest in the county and a wide variety of crops are raised in the area. In 1984 crop production Fallon County ranked 15th in oats production, 16th in both spring and durum wheat production, and 24th in winter wheat production. Barley, hay, and corn are also grown in the area.

Hog raising is the major livestock interest in the county. The December 1,1982 hog inventory showed Fallon County in 14th place among the hog producing counties. Cattle and sheep are also raised as Fallon County ranked 29th and 33rd, respectively, in the January 1, 1983 inventories.

1983 cash receipts for crops produced in the county came to $8,246,000. Livestock receipts turned in 9,474,000, while government payments added $2,692,000 for a total cash return of $20,592,000 in 1983.

REGIONAL PATTERNS OF WHEAT PRODUCTION

Wheat production has made a significant shift in 1985 with the Plains States increasing their share of total production and the Southern States giving up a substantial part of their share.

Sixty-two percent of this year's crop will be produced by eight Plains States. Last year they provided 57 percent of the U.S. crop. Nine Southern States produced 9 percent of the 1984 crop, but this year they will only contribute 5 percent to the total.

Corn Belt States held near last year's portion at 15 percent, down 1 point. Pacific Northwest States lost 1 point also, and will provide 11 percent of the U.S. output, compared with 12 percent in 1984.

WEATHER-CROP SITUATION

(For Week Ending August 25, 1985)

Precipitation in the last two weeks improved topsoil moisture enough to prompt some winter wheat seeding to begin.

Topsoil moisture supplies are reported mostly adequate but subsoil moisture is mostly short.

Small grain harvest has been slowed by damp, cool weather. Harvest progress is lagging behind last year's pace but is still ahead of normal. Usually by August 25 spring wheat, barley and oats harvest have just passed the halfway point. This year harvest is 65 to 70 percent complete. Second cutting alfalfa harvest, slowed by poor curing weather early in the week, picked up the pace later in the week and was 80 percent completed. This compares with 75 percent last year and 65 percent normally.

Recent moisture has helped pastures and ranges across the State and in some areas they are green for the first time in 1985.

CATTLE ON FEED IN 7 STATES DOWN

Cattle and calves on feed August 1 for slaughter market in the 7 states preparing monthly estimates totaled 6.39 million head, down 6 percent from a year ago and 7 percent below August 1, 1983.

Marketings of fed cattle during July totaled 1.67 million, 8 percent above last year and 12 percent more than July two years ago.

Placements of cattle and calves on feed in the 7 states during July totaled 1.07 million, down 19 percent from last year and 9 percent below July 1983. Net placements of 1.01 million for July are 18 percent below last year and down 6 percent from two years ago.

Other disappearance totaled 61 thousand head, compared with 84 thousand during July 1984 and 94 thousand during July 1983.

MONTANA JULY LIVESTOCK SLAUGHTER

Montana slaughter plants produced 2.0 million pounds of red meat during the month of July. This production was 16 percent higher than the previous month, but 54 percent lower than the July 1984 production. Production for the first seven months of the year was 18.6 million pounds, 28 percent less than last year.

For the month, cattle slaughter at 2,600 head, was down 62 percent from last year. Hog slaughter, also at 2,600 head, was up 8 percent.

NUMBER OF HIRED WORKERS DOWN, WAGES HIGHER

During the week of July 7-13, 1985, a total of 3.9 million people were working on farms and ranches in the United States. This includes workers hired directly by the farm operators and agricultural services employees working on farms. There were 3.9 percent (161,000) fewer workers on farms this July than a year earlier. Hired workers represented 44 percent (1.7 million) of the total. Of these workers, 1.4 million were hired directly by the farm operators. This was 4.3 percent less than July 1984. Farm operators and other unpaid workers who worked 15 hours or more accounted for the remaining 2.2 million workers, 5.1 percent below a year ago.

The wage rate for all hired farm workers was $4.24 per hour, 8 cents above the previous year. Workers paid on an hourly basis averaged $4.18, up 6 cents from a year ago. Field workers received an average of $4.07, up 14 cents from $3.93 per hour for the July 1984 survey week. Livestock workers received an average of $3.97 per hour compared with $3.93 a year earlier.

During the July 7-13, 1985 survey week, self-employed farm operators worked an average of 49.6 hours, 1.4 hours more than in the comparable week of 1984. Other unpaid workers averaged 40.0 hours, 0.8 less than a year ago. Hired workers averaged 37.6 hours, 0.8 hour less than a year ago. Hired workers averaged 37.6 hours, 0.8 hour above a year earlier. Compared with April of this year, self-employed farm operators averaged 5.4 hours more in July and other unpaid workers worked 4.3 hours more but hired workers averaged 2.5 hours less than in April.

Perquisites such as meals, housing or motor vehicles in addition to cash wages were provided to 41 percent of the hired workers in July 1985. Housing was furnished to 11 percent of the hired workers. In July 1984, 42 percent of the farm workers received some type of perquisite. Data from the 1984 Farm Costs and Returns Survey showed that the value of perquisites including health and retirement benefits, housing, and other non-cash benefits represented 16 percent of the farm and ranch labor expenditures.

1/ Excludes agricultural service workers. 2/ Regions consist of the following: NORTHEAST I: CT, ME, MA, NH, NY, RI, VT; NORTHEAST II: DE, MD, NJ, PA; APPALACHAIN I: NC, VA; APPALACHIAN II: KY, TN, WV; SOUTHEAST I: AL, GA, SC; LAKE: MI, MN, WI; CORN BELT I: IL, IN, OH; CORN BELT II: IA, MO; DELTA: AR, LA, MS; NORTHERN PLAINS: KS, NE, ND, SD; SOUTHERN PLAINS: OK, TX; MOUNTAIN I: ID, MT, WY; MOUNTAIN II: CO, NV, UT; MOUNTAIN III: AZ, NM; PACIFIC: OR, WA.
3/ Insufficient data.

Chouteau County derives its name from a Frenchman by the name of Pierre Chouteau, who was President of the American Fur Company headquartered at Fort Benton. The landscape in Chouteau County is characterized by gently rolling plain, divided into benches by the Missouri, Marias, and Teton Rivers. The Missouri River traverses the county from west to east, and the Marias and Teton Rivers join the Missouri near Loma, Montana. A northeastern portion of the county is occupied by the Bear Paw Mountains, while the Highwood Mountains and a section of the Lewis & Clark National Forest cover a small area in the south.

Chouteau County ranked 1st for both winter wheat and barley production in 1983; 3rd in spring wheat and 5th in durum wheat production, and also 7th in oats production in 1983. The abundant grain crops brought in $76,024,000 in cash receipts in 1983.

While crops are the major agricultural interest, livestock raising is also an important industry in the county. Chouteau County ranked 1st in the December 1, 1982 hog inventory, and 22nd in the January 1, 1983 cattle count. Receipts from livestock totaled $12,749,000 in 1983. Government payments came to $21,994,000 in 1983, and, combined with the crop and livestock receipts brings the total cash return for Chouteau County to $110,767,000 in 1983.

North Central	78	33	26
Northeast	69	34	20
Central	80	58	27
Southwest	91	89	50
South Central	74	69	32
Southeast	75	67	29
STATE	79	60	32

MONTANA WHEAT PRODUCTION LOWEST IN 24 YEARS

Montana's 1985 all wheat crop will be the smallest since 1961. Based on August 1 conditions the production forecast is down 46 percent from last year. Winter wheat production is down 64 percent, hard red spring wheat is down 12 percent, and durum is down 39 percent from a year ago.

The sharply lowered production forecast is the result of 21 percent fewer acres and a yield nearly 7.5 bushels lower. The winter wheat yield is expected to be 20 bushels per acre, down 7 from last year. Hard red spring wheat yield is forecast at 13 bushels per acre, down 4.5 from a year ago. Durum yield, at 12 bushels per acre is down 5 from last year. All of the wheat yields are the lowest since 1961.

The State's barley production also fell a drastic 49 percent from last year. Harvested acres are down 29 percent and the yield fell 8 bushels from last year. The barley yield at 20 bushels per acre is the lowest since 1961.

Oats production is down 15 percent, the result of 5 percent fewer acres for harvest and a 4 bushel decrease in yield.

Hay production is down 16 percent from last year and 22 percent from 2 years ago. Acres for harvest fell 9 percent mainly because much dryland acreage was abandoned to grazing.

August 1 production forecasts are based on producer reports of condition and yield. Actual field observations and measurements are also used in making the wheat production forecast.

CATTLE & CALF INVENTORY DOWN

The Nation's cattle herd on July 1, 1985 was down 4 percent from a year ago. This was the fourth consecutive year in which the cattle inventory declined.

Heifers being kept for beef cow replacements were down more than any other category with an 11 percent reduction from a year ago. Beef cows and heifers that had already calved were down 7 percent.

The only classes showing larger numbers compared with last year were milk cows, milk cow replacement heifers and other heifers.

The 1985 calf crop is expected to be down 3 percent from 1984 and 6 percent from 1983.

CATTLE & CALVES: NUMBER BY CLASS and CALF CROP, UNITED STATES JULY 1, 1983-1985

CLASS	1983	1984	1985	1985 as % of '84

CATTLE ON FEED DOWN

Cattle and calves on feed July 1 for slaughter market in the 13 quarterly states totaled 8.66 million head, down fractionally from July 1 last year and 5 percent less than two years ago. On feed numbers were the lowest for this date since 1981.

The cattle on feed inventory included 5.25 million steers and steer calves, down 5 percent from a year ago and 7 percent below 1983. This group represented 61 percent of the total July 1 number on feed compared with 63 percent in 1984. Heifers and heifer calves, at 3.38 million, were the highest since 1978, up 7 percent from last year and virtually the same as 1983.

Placements of cattle and calves on feed during the April-June quarter totaled 5.19 million, 7 percent below last year, 12 percent below 1983 and lowest for this comparable period since 1975. Other disappearance of 439 thousand head leaves net placements at 4.75 million.

Marketings of fed cattle for slaughter during April-June totaled 5.76 million, up 3 percent from the same quarter last year, 4 percent above 1983 and the largest for the quarter since 1978.

Cattle feeders expect to market 5.98 million head during the July-Sept. quarter of 1985. This would be 5 percent greater than the third quarter marketings in 1984, and 1 percent above 1983.

1985 APRIL-JUNE MILK PRODUCTION

Montana's April-June milk production was 5 percent above last year at 91 million pounds.

Milk cow numbers remained the same as last quarter and last year at 28,000. Average production per cow increased seasonally, over last quarter, and at 3,250 pounds per cow was 5 percent more than last year.

Dairymen fed 14 pounds of grain and concentrates per cow per day, the same as last year. The cost per 100 pounds of feed was down 10 cents.

Nationally, milk production in the second quarter of 1985 was 37.2 billion pounds, 5 percent above the same period last year.

The number of milk cows averaged 10.971 million, 165,000 more than last year for the April-June period. Production per cow at 3,394 pounds was nearly 3 percent above the previous year.

JUNE 1985 LIVESTOCK SLAUGHTER

Montana slaughter plants produced 1.8 million pounds of red meat during the month of June, 11 percent less than the previous month and 56 percent less than the June 1984 production. Production for the first half of the year was 16.6 million pounds, 22 percent less than last year. For the month, cattle slaughter at 2,500 head, was down 62 percent from last year. Hog slaughter at 2,300 head was unchanged from a year ago, but the total live weight of the hogs slaughtered was down 3 percent.

Nationally, commercial red meat production in June 1985 totaled 3.08 billion pounds, down 4 percent from June 1984. January-June red meat production, at 19.4 billion pounds, was up fractionally from last year. The 1985 accumulated production changes by individual components were: beef, up 1 percent; veal, up 4 percent; pork, down 1 percent; lamb and mutton, down 8 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

MONTANA BARLEY VARIETIES

Hector continues to be the most popular barley variety seeded in Montana. According to a June 1985 survey of growers, Hector, a feed type barley, was planted on 33 percent of the barley acres.

The second most popular variety was Piroline, a malting type. This variety occupied 20 percent of the acreage. Clark, another malting type was found in the number three position with 16 percent of seeded acres.

The six varieties recommended for malting accounted for 46 percent of total barley acreage

PASTURE & RANGE CONDITION

Montana's pasture and range condition on July 1 was 46 percent of normal--the lowest since 1931. Last year, the condition was 72 percent. Most non-irrigated pastures and ranges are dormant and dried under severe drouth conditions. Stockwater is also short in many locations. Range feed was depleted last year in most of the northern, central and eastern parts of Montana because of drouth, and were subjected to a very dry spring before the summer's drouth became severe.

MONTANA PLANTED CROP ACRES

Montana farmers planted more acreage to hard spring wheat in 1985 than a year ago and fewer acres to winter wheat. All other planted crop acreages remained about the same. Winter wheat plantings were down because of very dry seedbeds last fall, and spring wheat plantings got a big boost when much of the State's winter wheat plantings died out and had to be replanted.

Compared with a year ago, winter wheat plantings were down 9 percent; spring wheat plantings are up 46 percent; durum and oats are up 2 percent each; and barley is up 1 percent.

Acres for harvest of all grain crops in the State were estimated to be down 4 percent from last year as of June 1. Continued drouth since the June Acreage Survey has changed that picture considerably. A new harvested acreage estimate for all grain crops based on August 1st conditions will be released on August 12.

JULY CROP PRODUCTION FORECAST

Montana's 1985 **winter wheat crop**, badly damaged by insects, winter kill and a major drouth, will total only 26.0 million bushels--61 percent under last year's low production. This is the lowest production since 1956, and the crop is still vulnerable to acreage abandonment and yield loss due to the drouth. The forecast is based on farmer reported yield and condition as of July 1. The yield forecast is 20 bushels per acre and the acres for harvest are estimated to be 1.3 million.

Barley production in Montana is expected to total 47.2 million bushels, 20 percent under last year. The barley yield is forecast at 23 bushels per acre and acres for harvest are estimated to be 2.05 million. However, the acreage estimate is based on June 1 conditions and may not reflect the effect of widespread drouth since that time. **Oats production** at 3.3 million bushels is 15 percent under last year. The State's **sweet cherry crop** is estimated to be 3,000 tons, up 30 percent from a year ago.

The first production forecast for hard spring wheat, durum, corn, dry beans, sugarbeets and hay will be released August 12.

JUNE FARM PRICES

The Montana index of prices received for all farm products in mid-June at 144 (1977=100) was down 2 points from May and down 4 points from a year ago. The all crops index at 147 is unchanged from May but 17 points under a year ago. The livestock prices index at 140 was down 5 points from May but 7 points above a year ago.

All crop prices fell from May to June except barley and hard red spring wheat. All livestock prices registered declines except cows, sheep and hogs.

Nationally, the June index of prices received by farmers for all farm products was unchanged from May at 129 percent of its January-December 1977 average. Higher prices for hogs, tomatoes, potatoes, broilers and cotton were offset by lower prices for cattle, milk, wheat, hay, feed grains and lettuce. The index was 15 points (10 percent) below a year ago.

The June index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates was 164 percent of its 1977 average. The index for June was 1 point (0.6 percent) below both a month and a year earlier. The feeder livestock and feed indexes were down from May while the family living component was higher. The tractor price index was lower than three months ago as incentives offered by dealers and manufacturers lowered prices.

CROP & WEATHER CONDITIONS

CROPS: Soils continue to be mostly dry in the major crop areas of the State. Although light showers brought some relief, the complete lack of subsoil moisture coupled with hot, dry winds greatly reduced any benefits. Only about 10 percent of the State has adequate topsoil moisture, and reports are increasing that burn spots are beginning to develop in grain fields. Grasshopper control is still going on and serious gopher damage is also developing. Almost two-thirds of the winter wheat crop is in very poor to poor condition with the remainder only fair. About half the spring wheat and barley are in poor condition, about 40% in fair condition and about 10% is rated in good condition. All of the State's grain crops are maturing ahead of normal with some winter wheat already in the turning to mature color stage of development. Haying is active in most of the State and the hot, dry winds have helped to cure the cuttings rapidly. Strong winds in the north central scattered some windrows. Nearly 35% of the first cutting is done compared with 15% on the average. Irrigation water supplies are short in nearly 75% of the State. About 80% of the sugarbeets have been thinned.

LIVESTOCK & HAY: Pastures and ranges in over half the State are in very poor to poor condition. Only a small part of the ranges are in good condition. Cattlemen face the prospect of a sharply reduced grazing season on both private and public lands because of the drouth. Stockwater supplies are also being reduced, further aggravating utilization of pastures and ranges.

JUNE HOG & PIG INVENTORY -- U.S.

Hog & pig inventory in the U.S. June 1, 1985 is estimated at 52.1 million. This is 1 percent below a year ago and 10 percent below June 1, 1983.

The breeding inventory, at 7 million head is 5 percent below a year ago and 14 percent below two years ago. This is the smallest June 1 breeding inventory since June 1 U.S. inventory estimates were first established in 1964.

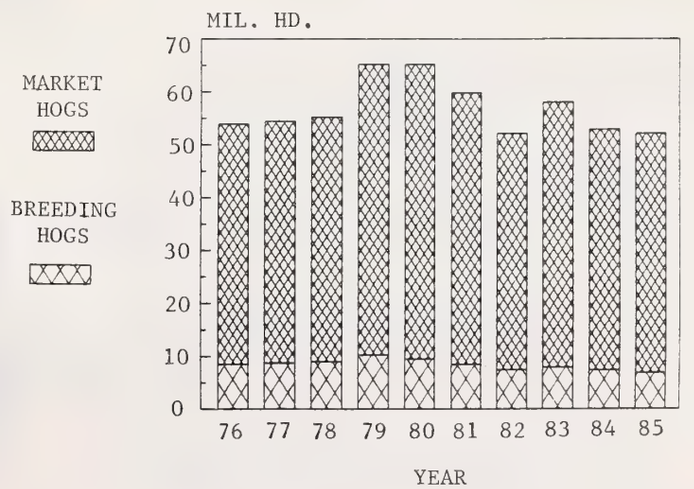
Market hog inventory at 45.1 million is 1 percent below a year ago and 10 percent below two years ago.

The December 1984-May 1985 U.S. pig crop was 42.5 million head, a slight increase from the corresponding period last year but down 10 percent from the comparable period two years ago.

U.S. producers intend to have 5.61 million sows farrow in the June-November 1985 period, a decrease of 4 percent from the same period in 1984 and 9 percent below 1983.

JUNE 1 HOGS & PIGS INVENTORY

UNITED STATES



BEEF SUPPLY & PRICES

Large beef supplies, together with increased poultry production, resulted in large total meat supplies. There was one less slaughter day during the first quarter of this year than in 1984, (one slaughter day difference on a quarterly production). Last year's first-quarter production was the highest since 1978. Because first-quarter beef production about equaled a year earlier, this year's production exceeded last year when adjusted for the difference in slaughter days. These large supplies led to weaker prices.

Choice steer prices at Omaha fell to a $59.58 average for March, down from $64.35 during January. Delayed marketings by cattle feeders, perhaps partially in anticipation of a price rally, compounded the problem. Dressed slaughter weights rose to 654 pounds by mid-March. Higher dressed weights resulted from cattle being held on feed longer, as well as higher daily gains. Weather throughout this winter was conducive to good weight gains. First-quarter dressed weights for cattle averaged 644 pounds, up 15 pounds from a year earlier. The increase resulted from a 23-pound rise in heifer weights and a 20-pound increase in steer weights from a year earlier. Choice steer prices averaged $62.24 for the quarter, down from $67.58 last year.

During April, dressed weights remained high and prices continued to decline, averaging about $58.75 for the month. Wholesale carcass prices for yield grade 3 steer carcasses at Omaha fell to $86 per cwt at times during the month, the lowest since 1979. At the same time, the price spread between yield grade 3 and 4 carcasses widened to about $16 per cwt as overfinished carcasses were heavily discounted.

Prices should begin to strengthen in late spring-early summer as retail movement picks up seasonally and production likely falls from the first half and a year earlier. Even though beef cow slaughter remained high during the first quarter, it began to drop sharply as the grazing season began. Beef cow slaughter fell below year-earlier levels beginning the first week of April. A substantial drop in cow slaughter will result in declining production this summer. Prices were probably supported by the strong economy last year. Economic growth will be considerably slower this year, so beef prices and live cattle prices will likely not receive the same boost. Omaha Choice steer prices may average $59-$62 for the second quarter and $62-$66 for the year.

CATTLE ON FEED IN 7 STATES UP

Cattle and calves on feed June 1 for the slaughter market in the 7 states preparing monthly estimates totaled 7.44 million head, up 2 percent from both June 1, 1984 and 1983.

MARKETINGS of fed cattle during May totaled 1.59 million, 3 percent below last year but 1 percent above May two years ago.

PLACEMENTS of cattle and calves on feed during May totaled 1.67 million, a 7 percent decrease from last May and 9 percent less than may 1983. **NET PLACEMENTS** of 1.54 million for May were 3 percent below May 1984 and 9 percent below two years ago.

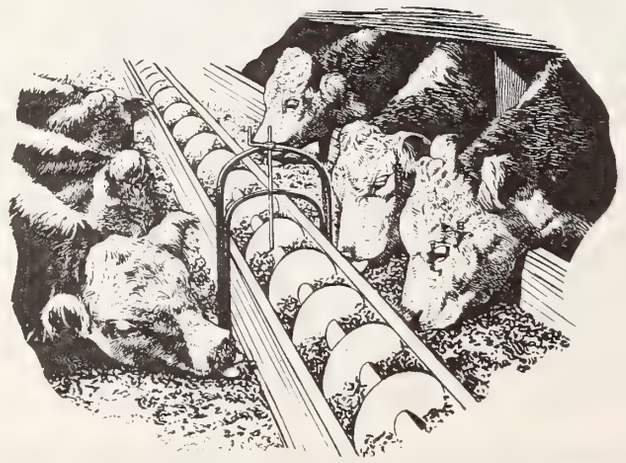
OTHER DISAPPEARANCE totaled 128 thousand head compared with 219 thousand in May 1984 and 150 thousand during May 1983.

LIVESTOCK SLAUGHTER

Montana slaughter plants produced 2.0 million pounds of red meat in May 1985, 11 percent more than the previous month but 51 percent less than a year ago.

May slaughter included 2,700 head of cattle, 57 percent below last year, and 2,500 hogs, 4 percent more than the previous year.

Commercial red meat production for the United States in May 1985 totaled 3.49 billion pounds, up 2 percent from May 1984. January-May red meat production, at 16.3 billion pounds (7.39 million metric tons), was up 1 percent from last year. The 1985 accumulated production percentage changes by individual components were: beef, up 2 percent; veal, up 6 percent; pork, down slightly; lamb and mutton, down 7 percent.



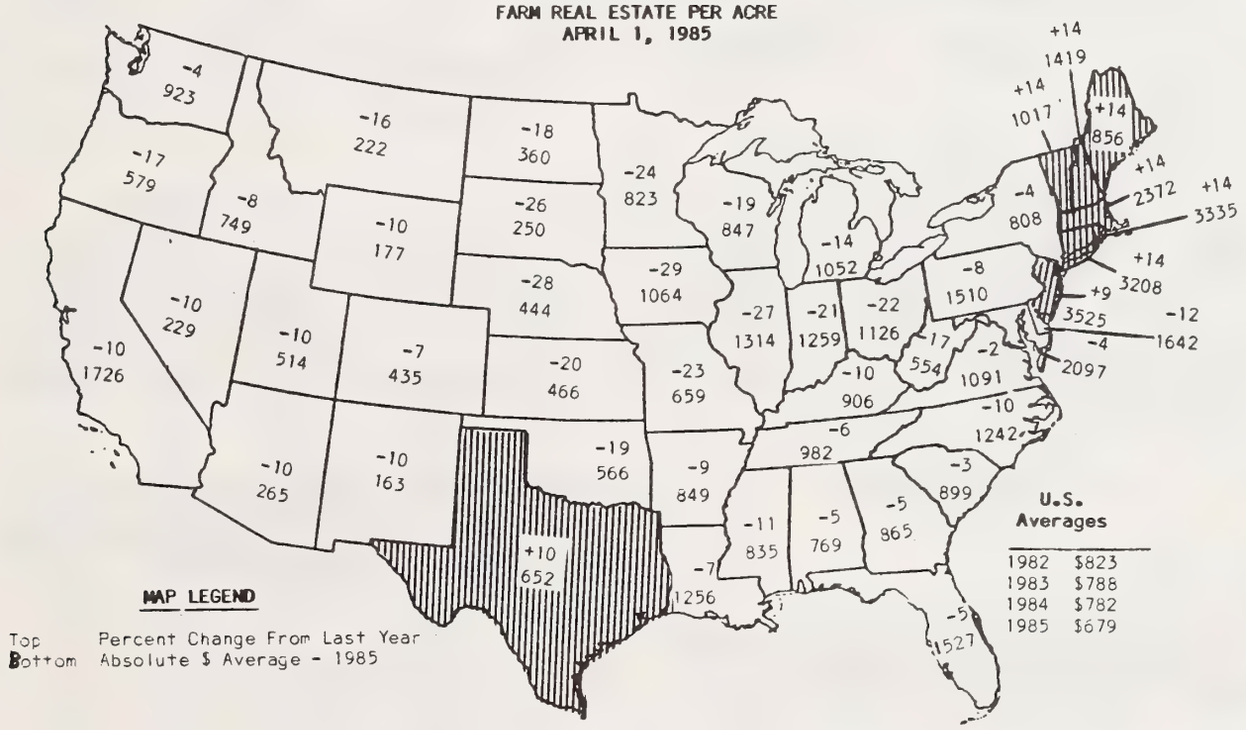
FARM LAND VALUES CONTINUE TO DECLINE

The downward trend in farmland values that began in 1981 accelerated during the past year. From April 1984 to April 1985, the index of farm real estate values dropped 12 percent to 128. Historically, the largest declines occurred in 1932 and 1933, when the index dropped 17 and 19 percent, respectively. During the past year, the largest decreases were in the Corn Belt, Lake States, and Northern Plains, which incurred losses of 20 percent or more. For the United States, values were 19 percent below 1981.

The Department of Agriculture annually surveys farmers, lenders, realtors, appraisers, farm managers, and others involved in the farmland market to obtain data on farmland values. The values are revised periodically for consistency with values reported by farmers in the Census of Agriculture.

The average farmland value for the United States was $679 per acre on April 1. The U.S. average encompasses a wide variety of productivity and use classes of land, from semi-arid rangeland to irrigated land producing high-value specialty crops. The relatively high values in several northeastern states reflect the demand for land for nonfarm purposes, as well as for farms that are used mainly as residences. States in the lower value ranges generally have little urban pressure and less productive land.

PERCENT CHANGE DURING 1984 AND AVERAGE VALUE OF FARM REAL ESTATE PER ACRE APRIL 1, 1985



EGG PRODUCTION

Montana poultrymen produced 51 million eggs in the three month period March-May 1985.

This is a 4 percent increase over 1984. The average number of layers on hand in that time period was 803,000 for 1985--5 percent more than in the previous year.

The Nation's laying flock was down 1 percent from the 1984 March-May quarter, but egg production was up 1 percent.

featuring..... GARFIELD COUNTY

Garfield County lies in east central Montana and the landscape is generally rolling. The entire northern and half of the eastern boundaries are comprised of the Fort Peck Lake. The Mussellshell River makes up the western boundary. Portions of the Charles M. Russell National Wildlife Refuge lie along the banks of Fort Peck Lake within the county. The Fort Peck Dam makes up a section of the extreme northeastern boundary.

Sheep raising is a main agricultural interest in the county as it ranked 2nd in sheep numbers in the January 1, 1983 inventory. The cattle count for the same date showed Garfield County in 15th place among the counties for cattle raising. Some hogs are also produced as the county ranked 23rd in the December 1, 1982 hog inventory.

Crops grown in the county include oats, winter wheat, spring wheat and barley, with the county ranking 14th, 19th, 20th and 29th, respectively, for those crops.

1982 cash receipts netted Garfield County a total of $22,513,000. The livestock portion of that total amounted to $12,451,000, while crops added in $7,997,000. Government payments made up the difference with $2,065,000.

SWEET CHERRY CROP FORECAST
PASTURE & RANGE CONDITION POOR
featuring.....DANIELS COUNTY

SMALL WINTER WHEAT CROP

June 1 conditions indicate a Montana winter wheat crop of 39.6 million bushels, 41 percent below last year. If realized this would be the smallest crop since 1962. An above normal amount of winter kill, coupled with cutworm and wireworm damage, this spring resulted in much more than the usual acreage that was reseeded to spring wheat.

The Nation's winter wheat crop is forecast at 1.89 billion bushels, 8 percent less than last year. The Plains States, accounting for 62 percent of the U.S. production, are up 5 percent. A much larger acreage in Texas this year accounts for most of the increase in production for these states. Production in the three Pacific Northwest States is down 17 percent and the Corn Belt States are off 28 percent. The Southern States with only 7 percent of the U.S. production are down the most with a 42 percent drop.

PASTURE & RANGE CONDITION

Montana's pasture and range condition on June 1 at 51 percent of normal was the lowest June 1 condition since the 1930s. The poor condition is the result of last summer's drought and very little rainfall this spring. As a result, growth has been slow and grasses have been maturing very short. Pastures and ranges now look like they would the end of August. A severe infestation of grasshoppers in many areas is adding to the problem as they can do considerable damage to rangeland and pastures.

Herds in many areas are being culled because of the poor grazing prospects and no hay supplies. Many cattle are being moved out of state for summer grazing. Rains were general the last of May which gave range grasses a boost, but more is needed and overall grazing prospects have been lowered for the season.

MONTANA PASTURE & RANGE CONDITION-- JUNE 1
by District as a Percent of Normal

DISTRICT	1983	1984	1985
Northwest	85	88	70
North Central	83	51	42
Northeast	88	27	39
Central	83	71	44
Southwest	82	87	63
South Central	84	78	52
Southeast	90	63	52
STATE	85	65	51

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants manufactured 170,000 gallons of ice cream in April, 2 percent more than in the same month last year. Creamed cottage cheese production at 378,000 pounds was 28 percent less than a year ago. Butter output was up 3 percent at 151,000 pounds. American cheese production at 317,000 pounds was 33 percent above the same month last year.

CHERRY PRODUCTION

Montana's sweet cherry crop is forecast at 2,700 tons, 17 percent more than last year. May weather was good for pollination during the peak bloom period. The average date of bloom was May 8th.

Sweet cherry production in the six western states is expected to total 96,800 tons, 33 percent less than last year.

AMERICAN LAND IN FOREIGN HANDS

Foreign investors have added to their holdings of U.S. agricultural land during the last few years--but not by much.

At the end of 1982, foreign holdings were reported at 13.5 million acres, or about 1 percent of all privately owned U.S. agricultural land. The most recent count, as of October 1984, found slightly more than 14 million acres under foreign ownership--1.1 percent of all privately owned agricultural land.

Rhode Island Remains the Only State Where No Foreign Holdings Are Reported

Foreign-owned agricultural land by state, in thousands (000) of acres:

The difference: roughly a half million acres, and not all of this increase is attributable to transactions by foreign interests since 1982. Some of the foreign transactions were simply reported too late to be included in the 1982 total. Of course, the same qualification applies to preliminary 1984 data.

Figures for 1984 are from USDA's latest report on foreign ownership and show 57 percent of all foreign-owned agricultural acreage is forestland; only 14 percent is cropland. The rest is pasture and other agricultural land.

MAY FARM PRICES

The Montana index of prices received for all farm products during mid-May at 148 percent (1977=100) was down 3 points from April and down 4 points from a year ago. The all crops index at 149 compares with 147 in April and 160 a year ago. The livestock price index at 148 was down 6 points from April, but 3 points above a year ago.

Slight price increases since April were seen for wheat, but oats prices fell. All livestock prices registered declines except for lambs and wool.

Nationally, the May all farm products index of prices received by farmers decreased 2 points from April to 129 percent of its January-December 1977 average. Lower prices for tomatoes, cattle, wheat, milk and soybeans were partially offset by higher prices for oranges, onions, hay, lettuce and potatoes. The index was 16 points below a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for May was 165 percent of its 1977 average. The index was unchanged from last month and last year. The feed and feeder livestock indexes were lower than April, while the fuels & energy index was higher.

featuring. . . . . DANIELS COUNTY

Daniels County is situated in the northeastern corner of Montana, bordered on the south by the Fort Peck Indian Reservation and to the north by Canada. It was created in May of 1920 and covers approximately 913,216 acres of land. The land is characterized mainly by rolling prairie. The Poplar River, which eventually empties into the Missouri River, cuts through the middle of the county. The West Fork of the Poplar River crosses the southwestern corner of the County. Scobey is the county seat, and this area has an average annual precipitation of 13.49 inches.

Daniels County has become a major spring and durum wheat producing area, ranking 5th and 7th, respectively, for those crops in 1983 crop production. Other crops grown include barley and oats, along with some winter wheat and hay.

Livestock raising is also a major part of the agricultural industry in Daniels County as it ranked 5th in hog numbers in the December 1, 1982 hog inventory. Sheep and cattle are also raised in the area.

Wheat and other crops produced in Daniels County brought in $23,828,000 in 1982 cash receipts. Livestock returned $5,361,000 the same year, while government payments added $4,207,000. The total cash return for Daniels County in 1982 was $33,396,000.

MONTANA WEATHER-CROP SUMMARY

for WEEK ENDING May 26, 1985

Montana planting progress is well ahead of normal for this time of year. Small grains are all in the ground and 90 percent of the spring wheat and barley acreage has emerged, compared with 70 percent normally up at this date.

Late season crops are going into the ground at a rapid pace, also. Corn is 85 percent planted compared with 75 percent normal. In most areas of the state topsoil and subsoil moisture are rated short to very short. Pasture and range feed conditions are mostly poor. About 70 percent of cattle and sheep have been moved to summer ranges. Some ranchers are continuing to supplement range feed with hay and feed grains, especially in the Northcentral region.

NATIONAL WEATHER CROP-week ended May 19

HIGHLIGHTS: Major field crop development and seeding continued outpacing last year and normal. Seeding was ahead of last year and the normal for spring wheat, rice, corn, sorghum, soybeans, and cotton. Heavy rain helped replenish moisture in the Northeast, but dryness plagued the West Coast, Mountain, and some Northern Plain States. Soil moisture was adequate elsewhere, except the Southeast had mostly adequate readings, but leaned towards becoming short. Farmers were able to work 3 days or less in the Central Plains and portions of the Corn Belt, but were active 5-6 days elsewhere.

NUMBER OF HIRED WORKERS DOWN---WAGES LOWER

During the week of April 7-13, 1985, 3.0 million people were working on farms and ranches in the United States. This includes workers hired directly by the farm operators and agricultural services employees working on farms. This is down 6.5 percent (212,000) from October 1984 and down 18 percent from April 1981, when a Farm Labor Survey was last conducted in the spring. Hired workers represented 37 percent (1.1 million) of the total. Of these workers, 0.9 million were hired directly by the farm operators. This is 12 and 28 percent fewer than in October 1984 and April 1981 respectively. Farm operators and other unpaid workers who worked 15 hours or more accounted for the remaining 1.9 million workers, 5.9 percent below October and 20 percent below April 1981.

The wage rate for all hired farm workers was $4.52 per hour, down four cents from October. Workers paid on an hourly basis averaged $4.37, down eight cents from October. Wage rates for other categories of workers were: field $4.53, livestock $3.94, and piece-rate $5.61. The all hired wage rate for April 1985 was 60 cents (15 percent) above the comparable rate for 1981 and the hourly wage rate was 51 cents (13 percent) higher than in April 1981.

During the April 7-13, 1985 survey week, self-employed farm operators worked an average of 44.2 hours, 1.1 hours more than in October and 5.8 hours more than in April 1981. Other unpaid workers averaged 35.7 hours for the week, down 0.7 and 1.1 hours from October 1984 and April 1981, respectively. Hired workers averaged 40.1 hours, 0.1 hour less than in October, but 2.2 hours more than in April 1981.

Perquisites such as meals, housing or motor vehicles in addition to cash wage were provided to 47 percent of the hired workers in April 1985. Housing was furnished to 17 percent of the hired workers. In October 1984, 49 percent of the farm workers received some type of perquisite.

3/ INSUFFICIENT DATA.

WHERE DO U.S. EXPORTS GO?

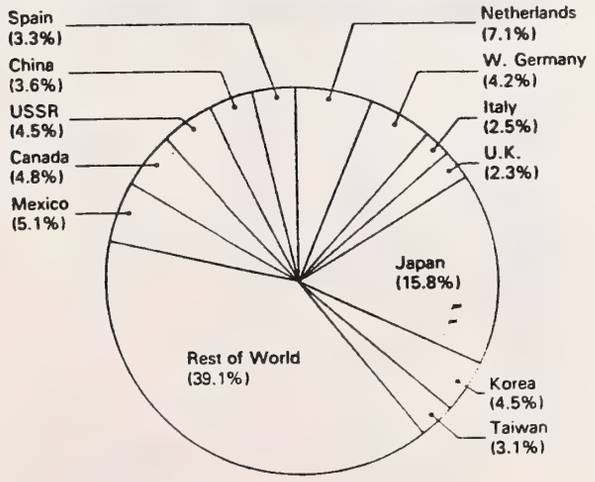
In fiscal 1984, nearly 60 percent of the value of all U.S. agricultural exports went to 10 countries. The 10 account for about 80 percent of the export value of U.S. feed grains and over 60 percent of U.S. wheat.

Most of the countries listed as our 10 largest markets in 1984 were also among the 10 largest 5 years ago. With the exception of the Soviet Union, the composition of the group is fairly stable from year to year. However, some changes have occurred.

Countries that are members of the European Community as well as major U.S. customers have decreased their purchases of U.S. products. Meanwhile the shares of several developing countries--Mexico, Korea, Taiwan, and Egypt--have increased. The trend is not confined to just the United States' 10 major customers. The share sold to all developed countries fell to 50 percent in 1984 and the developing countries' share rose to 39 percent, each group changing about 5 percentage points since 1979.

Japan has been the largest customer for U.S. agricultural products for many years. Not only is Japan's share of U.S. agricultural exports more than twice as large as any other country's, but it is consistently in that position. Alone, Japan accounts for one-fifth to nearly one-third of U.S. fruit, soybean, tobacco, cotton, and feed grain exports. Japan's arable land is only about 1 percent that of the United States, and much of it is planted to rice and vegetables. However, rising incomes are increasing demand for poultry and red meat. Japan's growing livestock sector currently depends on imports for 70 percent of its feed, and the imports' share is increasing. Only 2 percent of the country's coarse grain consumption comes from domestic production.

Japan Is Single Largest Customer for U.S. Farm Exports



Cumulative exports, 1980-84

Japan's agricultural policies, like those of most countries, aim to promote food production and security. But support for domestic food and farmers has emphasized rice, historically the most important crop. There are no import duties on feed grains and imports from the United States rose 37 percent between 1979 and 1984. Feed grains now account for over one-third of the value of U.S. exports to Japan.

Korea and Taiwan share several important features with Japan. Though Japan's highly developed economy sets it apart, all three have limited land and share a tradition and preference for rice. Though less developed, Korea and Taiwan are industrializing and have shown strong income growth and increased meat consumption since development accelerated in the 70's.

CATTLE ON FEED UP 2 PERCENT

Cattle and calves on feed May 1 for the slaughter market in the 7 States preparing monthly estimates totaled 7.50 million head, up 2 percent from a year ago and 4 percent more than May 1, 1983, according to the Crop Reporting Board.

Marketings of fed cattle during April totaled 1.60 million, a 5 percent increase from last year and 9 percent above April two years ago.

Placements of cattle and calves on feed in the 7 States during April totaled 1.42 million, 6 percent below last year and 10 percent below 1983. Net placements of 1.28 million for April were down 4 percent from last year and 10 percent below April 1983.

Other disappearance totaled 133 thousand head compared with 184 thousand during April 1984 and 143 thousand two years ago.

SLAUGHTER AND RED MEAT PRODUCTION

Montana slaughter plants produced 1.8 million pounds of red meat in April. This production was 10 percent more than the previous month but 42 percent less than April 1984. The January-April accumulated total was 12.9 million pounds, 4 percent less than the production for the same period last year.

Cattle slaughter at 2,300 head was down 48 percent from last year. Hog slaughter at 2,800 head was up 27 percent.

featuring. . . . . TOOLE COUNTY

Toole County is located along the Montana/Canadian border in north central Montana. The approximately 1,235,654 acres are made up largely of rolling prairie and bench lands, except for the Sweet Grass Hills in the northeastern quarter of the county. The Marias River traverses the southern tip of the county where it empties into Lake Elwell in the southern quarter. Oil fields, located near Sunburst and Kevin, Montana, which were quite productive in the 1920s and 30s, are still in operation today.

Toole County is one of the major crop production areas in the state. The county came in 3rd in durum wheat, 6th in winter wheat and 14th in spring wheat in 1983 crop production. Toole County also ranked 10th in barley production and 19th in oat production in 1983.

Hog raising is also a major agricultural interest as the county ranked 7th in the December 1, 1983 hog inventory. Cattle and sheep are also raised although not to a great extent.

Crops produced in Toole County returned $48,309,000 in 1982, while the livestock receipts totaled $4,913,000. Government payments came to $5,365,000 for a total cash return of $58,587,000 for Toole County in 1982.

WINTER WHEAT CROP DOWN

The Nation's winter wheat crop, forecast at 1.97 billion bushels, will be 4 percent less than last year. Acres for harvest are down 6 percent, and the expected yield at 40.7 bushels per acre is 0.7 bushel above a year ago.

For Montana, production is expected to total 39.6 million bushels, 40 percent less than last year. Winterkill on the acreage planted last fall has been much above average and, as a result, the State's acreage at 1.8 million is down 27 percent. This amounts to only 72 percent of the acreage planted last fall. Yield prospects at 22 bushels per acre is down 5 bushels from last year and the lowest since 1962.

MONTANA WHEAT STOCKS DOWN

Wheat stored on Montana farms and in mills and elevators April 1, 1985 totaled 111.4 million bushels--down 9 percent from a year ago.

Wheat disappearance since January 1 was 30.5 million bushels, down 20 percent from a year ago. Farm storage at 80.6 million bushels was 17 percent below a year ago and commercial storage at 30.9 million bushels was up 21 percent.

Total winter wheat stored in the state at 65.2 million bushels was about the same as last year. All spring wheat at 46.3 million bushels was down 19 percent from a year ago. The durum portion at 9.2 million bushels was down 15 percent. Barley stocks totaled 25.3 million bushels--up 13 percent and oats in storage at 2.6 million bushels were down 27 percent.

NATIONAL WHEAT STOCKS LOWER

Nationally, all wheat stored in all positions on April 1, 1985 totaled 1.67 billion bushels, 5 percent less than the 1.76 billion bushels stored on April 1, 1984. Farm stocks, at 714 million bushels, are down 7 percent from April 1 a year ago. Off-farm stocks amounted to 954 million bushels, off 3 percent from April 1, 1984. Indicated disappearance from all storage positions during January-March 1985 is 474 million bushels, down 17 percent from the comparable quarter in 1984.

U.S. durum wheat stored in all positions on April 1, 1985 is estimated at 115 million bushels, down 5 percent from the 120 million bushels on hand April 1 a year earlier. Farm stocks totaled 81.8 million bushels, 5 percent less than April 1, 1984

Barley stored in all positions on April 1, 1985 totaled 319 million bushels, 19 percent more than the 269 million bushels stored on April 1,1984. Stocks of barley stored on farms amounted to 216 million bushels, or 68 percent of the total stocks.

APRIL FARM PRICES

The April index of prices received by Montana farmers and ranchers was unchanged from the previous month. The index held at 150 percent of its 1977 average as the all crops index remained unchanged and the livestock and livestock products index eased down 1 point.

Winter wheat, barley and oats fell off from March to April while durum, other spring wheat and hay were up.

In the livestock index all commodities were down except steers and heifers, which showed a 30 cent increase, and wool was unchanged. Compared with last year the prices received index is down 4 points.

The April all farm products index of prices received by U.S. farmers decreased 2 points from March 1985 to 132 percent of its January-December 1977 average. Lower prices for cattle, hogs, milk, eggs and tomatoes were partially offset by higher prices for potatoes, corn, grapefruit and sorghum. The index was 14 points below a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for April was 164 percent of its 1977 average. The index was unchanged from a month earlier but was down 1 point from April 1984. The fuels & energy and family living indexes for April were up from a month ago. Offsetting were slight decreases from March by the feed and feeder livestock components and a moderate decline in the seed index that is updated in April and September each year.

POTATO STOCKS

In Montana, total stocks of potatoes on hand May 1 totaled 150,000 cwt, three times the amount in storage a year ago, but only 8 percent of the 1984 production.

Nationally, May 1, 1985 potato stocks totaled an estimated 51.6 million cwt in the 15 major states, a gain of 2 percent over last year, but 10 percent short of May 1983 stocks. Current stocks account for 17 percent of fall potato production compared with 18 percent last year.

In the 6 Western States, May 1 potato stocks totaled 38.3 million cwt, a gain of 2 percent over last year, but down 9 percent from 1983. Idaho stocks are up 2 percent; while Washington and oregon are off 1 and 4 percent respectively. Colorado storages contain 37 percent more potatoes this year than last but California stocks are down 33 percent.

PASTURE & RANGE

Montana's overall pasture and range condition on May 1 was in poor to fair condition. Areas most seriously affected by last year's drouth have the poorest condition this spring--namely the north central and northeastern parts of the State. Most livestock have been turned out to graze, but unless timely rains occur during May and June range grazing prospects will be poor.

MONTANA PASTURE & RANGE CONDITION—MAY 1
by District as a Percent of Normal

DISTRICT	1983	1984	1985
Northwest	89	92	82
North Central	80	68	54

Southwest	94	92	89
South Central	82	82	75
Southeast	85	68	77
STATE	85	74	68

HAY STOCKS

Hay stocks on Montana farms as of May 1 were 567,000 tons--the lowest for this date since 1977. The 10 year average for May 1 hay stocks on Montana farms is 904,400 tons. This year's low level was caused mainly by drouth during last year's growing season that reduced levels.

MONTANA SHEEP & LAMB DEATHS UP SHARPLY

Montana sheepmen lost 180,000 sheep and lambs in 1984 to weather, predators, disease and other causes--50 percent more than in 1983.

The value of the loss came to $7.9 million. This is a 72 percent increase over 1983. Predators took $2.3 million, non-predator factors $4.9 million and unknown causes took $.7 million of the total loss.

The two most damaging factors, weather and coyotes, took more than half the entire toll, accounting for $5 million. Weather caused a $3.3 million loss and coyotes $1.7 million.

Bad weather caused the death of 26,700 sheep and 46,100 lambs in 1984. The previous year, weather caused 4,600 sheep deaths and 27,200 lamb deaths.

Predator loss was up 50 percent with coyotes killing more than twice as many sheep, and 51 percent more lambs than the year before.

(SEE TABLES & CHART ON INSIDE PAGES.)

MONTANA MILK PRODUCTION UNCHANGED

Montana dairies produced 85 million pounds of milk during the first quarter of 1985. Production levels were virtually unchanged from last year despite a 3 percent decline in milk cow numbers. The January-March production was down 3 percent from the previous quarter, however, partially due to the stress of cold weather.

The daily amount of grain and other concentrates fed to milk cows increased one half pound per head to 14.5 pounds. The average cost of this concentrate was down 20 cents per cwt from last year at $7.40.

Nationally, milk production during January-March totaled 33.6 billion pounds, 1 percent less than the first quarter of 1984.

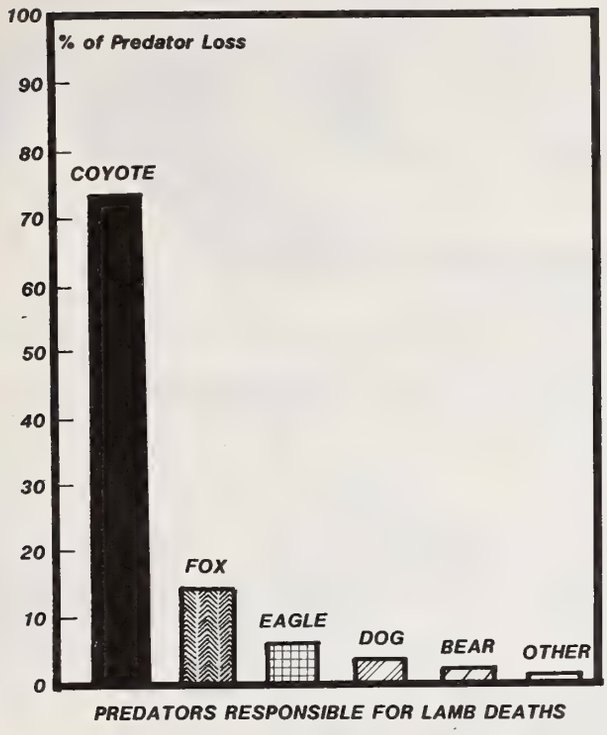
LAMBS LOST TO PREDATORS



MORE POTATOES IN STORAGE

Montana potato stocks on April 1 at 1,180,000 hundredweight are 12 percent above a year ago, and amount to 61 percent of production. Most of Montana's potato production is certified seed and traditionally does not move out of storage until March and April.

Nationally, stocks of potatoes in the 15 major States on April 1 are estimated at 85.4 million cwt, up 5 percent from last year, but 5 percent below April 1983. The remaining stocks account for 28 percent of Fall potato production compared with 29 percent on hand this time last year.

Stocks in the six Western States totaled 60.0 million cwt, up 3 percent from last year, but 5 percent below two years ago. Idaho and Washington stocks were each about 1 percent above 1984 levels; Oregon holdings were down 2 percent. Colorado stocks were up 32 percent, while California storages held 18 percent less than a year ago. Montana potatoes (mostly for seed) started moving, but present stocks are 12 percent above last year.

1984 EGG RECEIPTS UP

Montana poultrymen received 10.3 million dollars for eggs sold in 1984--18 percent more than 1983. Egg marketings were almost 3 percent above the previous year and the average price was up 15 percent.

The number of chickens sold was down 13 percent, but the price advanced 14 percent and held cash receipts to a 1 percent decline.

For the nation, prices were up from last year for both chickens and eggs. Cash receipts increased 15 percent for chickens sold and were up 18 percent for eggs.

MONTANA RED MEAT PRODUCTION DOWN

Montana slaughter plants produced 1.6 million pounds of red meat in March, 53 percent less than February 1985 and 28 percent below March 1984. The January-March accumulated total was 11.1 million pounds, 8 percent above the same period last year.

Cattle slaughter at 2,100 head was 32 percent below last year. Hog slaughter at 2,400 head was the same as the previous year.

Commercial red meat production for the U.S. in March 1985 totaled 3.16 billion pounds, down 6 percent from March 1984.

CATTLE ON FEED UP IN 13 QUARTERLY STATES

Cattle and calves on feed April 1, 1985 for the slaughter market in the 13 Quarterly States totaled 9.68 million head, up 4 percent from a year earlier and up 6 percent from April 1, 1983. The cattle on feed inventory included 5.95 million steers and steer calves, about the same as last year's level, but up 2 percent from April 1, 1983. Steers and steer calves made up 61 percent of the inventory total for April 1, 1985 compared with 64 percent the two previous years. Heifers and heifer calves numbered 3.68 million head on April 1, showing an increase of 10 percent from a year ago and 12 percent from two years earlier.

U.S. SHEEP & LAMB OUTLOOK

Commercial production of lamb and mutton totaled 371 million pounds in 1984, up 1 percent from a year earlier and the fifth consecutive year of increase. The increase was due to liquidation because of drought in some major sheep production areas and poor returns in 1983. The farm price of lambs averaged $60 per cwt in 1984, compared with $55 in 1983. Prices were strongest in the third quarter when production dropped below year-earlier levels.

Commercial lamb and mutton production is projected to be around 330 million pounds in 1985, down 11 percent from 1984.

Slaughter lamb prices at San Angelo are expected to average $63 to $69 in 1985. The expected strength in the red meat complex, the growing economy, and smaller lamb production are the contributing factors.

MONTANA WOOL PRODUCTION DECLINES

Montana wool growers produced 5.2 million pounds of wool in 1984, 9 percent less than in the previous year. The value of this year's clip was up, however, because the price per pound averaged 91 cents compared with 67 cents last year. Value of the 1984 wool crop was $4.7 million--23 percent over 1983.

Compared with U.S. averages, Montana wool growers did very well with an average price per pound of 91 cents, while the U.S. average was 79.5 cents. The State's fleece weights averaged 9.6 pounds each, while the U.S. average was 7.74 pounds.

Montana retained its number 7 ranking among all states in total wool production. Only Texas, California, Wyoming, Colorado, South Dakota and Utah out-ranked Montana.

PASTURE & RANGE

Montana's pasture and range condition on April 1 was 65 percent of normal reflecting a four year drouth cycle in much of the northern and eastern counties. Ranges are still dormant so moisture during April and May will be beneficial as new grass will start but won't last without more moisture. In many of the north central and northeastern areas hay supplies are short and won't last until new grass is available. Ranchers in these areas are already extending hay supplies by feeding straw and cake.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants manufactured 118,000 gallons of ice cream in February, 13 percent less than in the same month last year. Creamed cottage cheese production at 309,000 pounds was 41 percent less than a year ago. Butter output was up 3 percent at 180,000 pounds. American cheese production was 58 percent over last year at 225,000 pounds.

MARCH FARM PRICES

The March index of prices received by Montana farmers and ranchers was unchanged from February at 153 percent of the 1977 average. Compared with last year the index was down 5 points. The March index for crops was down 2 points from February, but the livestock and livestock products index was up 4 points.

All crops prices were unchanged or lower than last month except for durum wheat, which was up 1 cent.

The all beef cattle price was up $2.20 per cwt as marketings shifted from cows to steers and heifers. Cow prices advanced 80 cents. Steers and heifers were up 10 cents. The only other component of the livestock and products index showing an increase from February to March was eggs, up 9 cents. Hogs were down $4.90 per cwt, calves and sheep were down 80 cents, lambs were down 60 cents and wool was down 5 cents per pound.

The March all farm products index of prices received by U.S. farmers decreased 1 point from February to 134 percent of its January-December 1977 average. Lower prices for hogs, cattle, oranges, milk and wheat were partially offset by higher prices for tomatoes, eggs, cotton, potatoes, and sorghum. The index was 11 points below a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for March was 164 percent of its 1977 average. The index was unchanged from a month earlier and a year ago. Increases from last month in the fuels and energy and family living indexes were offset by decreases in feed, fertilizer and farm machinery components.

Madison County was created in February of 1865. It occupies approximately 2,297,452 acres in southwestern Montana. Surrounded and divided by mountain ranges, Madison County is composed of two parallel valleys--the Madison and the Ruby. Portions of the Beaverhead National Forest lie within the boundaries of the county. Flowing from south to north is the Madison River in the eastern part of the county, and the Ruby River in the western half. The Ruby joins the Beaverhead River near Twin Bridges, Montana, which then joins the Jefferson River and continues on out of the county. The Ruby River Reservoir is located on the Ruby River near Alder, Montana.

Madison County lends itself to abundant livestock production and ranked 4th and 7th, respectively, in cattle and sheep numbers on January 1, 1983. In the December 1, 1982 hog inventory, Madison County showed up in 16th place.

Hay production is a major agricultural interest in the county as it ranked 2nd in 1983 production of that crop. Spring and winter wheat, barley and oats are also produced in the area.

The thriving livestock industry brought Madison County $21,933,000 in cash receipts in 1982. Crops contributed $5,105,000, while government payments added $581,000 for a total return of $27,619,000 in 1982.

CATTLE ON FEED UP FROM A YEAR EARLIER

Cattle and calves on feed March 1, 1985 for slaughter market in the 7 states preparing monthly estimates totaled 7.88 million head, up 5 percent from a year ago and 4 percent above March 1,1983.

MARKETINGS of fed cattle during February totaled 1.54 million, down 5 percent from last year but 3 percent above February 1983.

PLACEMENTS of cattle and calves on feed during February were 1.34 million, 3 percent above last year and 15 percent above February 1983. **NET PLACEMENTS** of 1.25 million were up 2 percent from last year and 20 percent above February 1983.

OTHER DISAPPEARANCE totaled 94 thousand head compared with 82 thousand during February 1984 and 121 thousand two years ago.

GRAIN MOVEMENT

Montana wheat shipped to out-of-state destinations June-November 1984 was 26 percent below the same period last year. Rail movement was off 30 percent at 31.1 million bushels, and truck shipments were down 10 percent at 11.5 million. Trucks carried 27 percent of the total 42.6 million bushels shipped to out-of-state destinations.

Wheat destined for out-of-state points in western states (primarily Washington and Oregon export facilities) represented 95 percent of total shipments.

Eastern destinations received 65 percent less than in the same period last year and represented 2.5 percent of total out-of-state movement. Other destinations received 13 percent more than in the same period last year and increased their share of total movement.

Montana barley shipped to out-of-state destinations June-November 1984 at 13.0 million bushels was down 56 percent from the same period in 1983. Rail movement fell off 63 percent and truck movement was off 35 percent.

Movement shifted from west to east, especially for rail traffic. Rail movement east was 5.0 million bushels in the June-November 1984 period compared with 1.6 in 1983. At the same time, rail movement west was 2.8 million in 1984 compared with 19.4 in 1983.

FEBRUARY RED MEAT PRODUCTION

Montana slaughter plants produced 3.4 million pounds of red meat in February, down 44 percent from January, but only 1 percent less than the same month last year.

February **cattle slaughter** was less than half the previous month at 4,800 head, and was 11 percent below a year ago. **Hog slaughter** numbered 2,200--15 percent less than a month ago but 5 percent more than last year.

Nationally, commercial red meat production for the United States in February 1985 totaled 2.94 billion pounds, down 5 percent from February 1984.

Beef production, at 1.77 billion pounds was down 5 percent. Head kill was 2.78 million, down 7 percent. Average live weight increased 13 pounds to 1,087. **Veal production,** at 37 million pounds was up 3 percent. Calf slaughter totaled 253 thousand head, a decline of 1 percent. Average live weight increased 5 pounds to 245. **Pork production** totaled 1.11 billion pounds, down 5 percent. Hog kill, at 6.40 million head, declined 6 percent, however, the average live weight increased 1 pound to 245. **Lamb and mutton production,** at 28 million pounds was down 12 percent. Slaughter totaled 484 thousand head, down 14 percent. The average live weight declined 1 pound to 114.

POTATO STOCKS UP

In Montana, total stocks of potatoes on hand March 1, at 1,740,000 cwt, were 12 percent above the stocks in storage a year ago.

Nationally, potato stocks were estimated at 117 million cwt on March 1, 1985 in the 15 major storage States. This is up 3 percent from last year, but 5 percent short of March stocks two years ago. The storage total represents 39 percent of fall production this year compared with 40 percent on hand a year ago.

The six Western States stored 78.0 million cwt of potatoes on March 1, up 2 percent from a year ago but 4 percent short of 1983 holdings. Idaho stocks were equal to last year; Washington was down 1 percent. Oregon storages carried 4 percent more potatoes, but California had 15 percent less. Colorado found potato stocks 27 percent greater than last year at this time. Montana had 12 percent more potatoes in storage than last year.

HOG INVENTORY DOWN

Inventory of all hogs and pigs on March 1, 1985 in the 10 states conducting quarterly hog surveys is estimated at 39.5 million head, 1 percent below last March 1. This is 6 percent below March 1, 1983 and the lowest March 1 inventory since 1976.

--Breeding inventory, at 5.22 million head, is 4 percent less than last year and 13 percent less than March 1, 1983. This is the lowest March 1 breeding herd inventory since 1973, when estimates for these comparable 10 states became available.

--Market hog inventory, at 34.3 million head, is 1 percent below a year earlier and 5 percent below two years ago.

PIG CROP: The December 1984-February 1985 pig crop was 14.5 million head, 2 percent above the corresponding period last year but 9 percent below two years ago. There were 1.94 million sows that farrowed during the quarter, a decrease of 1 percent from the year earlier quarter and 10 percent below the same period two years ago.

Sow farrowings averaged 7.51 pigs per litter compared with 7.27 last year and 7.45 two years ago. The litter rate is the highest on record for a December-February quarter.

FARROWING INTENTIONS: Hog producers in the 10 quarterly states intend to have 2.37 million sows farrow during March-May of this year. If these intentions are realized, farrowings would total 5 percent less than the actual number for the comparable period of 1984 and 15 percent less than the 1983 quarter. Farrowing intentions for June-August are 2.20 million head, 3 percent below actual farrowings for the same period of last year and 9 percent less than two years ago.

MONTANA EGG PRODUCTION

Montana poultrymen produced 47 million eggs in the December-February quarter--4 percent less than in the preceding quarter and 2 percent less than in the same period a year ago.

The average number of layers in the flocks during the quarter was 788,000, nearly 3 percent more than the previous quarter and 7 percent more than a year ago.

The Nation's laying flock increased 2 percent in size compared with last year and egg production was up 3 percent.

featuring. . . . . SANDERS COUNTY

Sanders County is located along the Montana/Idaho border in northwestern Montana. The county's 1,759,097 acres are characterized mainly by mountainous country, except for the area along the eastern boundary of the county which is flat. A part of the Flathead Indian Reservation is located in this area. Portions of the Kootenai, Lolo, and Kaniksu National Forests make up the better part of Sanders County. A section of the Bitterroot Mountain range runs the length of the western boundary. Part of the Cabinet Mountains are contained within the boundaries in the northwestern leg of Sanders County. The Clark Fork River cuts through the center of the county. Found along the River in the northwestern leg of Sanders County are the Cabinet Gorge Dam and Reservoir, and the Noxon Rapids, Dam and Reservoir.

Its lumber resources are the county's most important asset. While agriculture is not an extensive interest in Sanders County, there is a variety of crops and livestock raised. Crops grown include hay, oats, winter and spring wheat, barley and corn. The major livestock interests--sheep, cattle and hogs are all produced in Sanders County.

In 1982, livestock and livestock products returned $3,966,000 in cash receipts. Crop production brought in $1,349,000 while government payments added $179,000. This makes for a total of $5,494,000 in cash receipts in 1982.

AGRICULTURAL OUTLOOK

The economy is expanding faster than anticipated, and consumer and industrial demand for farm products will grow at above average rates again in 1985. However, the largest gains will continue to be in restaurant spending and other service additions to raw farm products. Actual demand at the farm level is expected to increase 1.5 to 2.0 percent--not enough to remove burdensome supplies of major program crops. Rising employment and higher consumer incomes should help domestic demand for meat, though.

Abundant crop supplies for the next year and lower crop prices have increased concern about farmers' current financial stress. However, no immediate turnaround in the farm financial situation is expected.

World trade is likely to continue expanding, as import demand in the United States, Japan and other dynamic economies fuels export sales in the rest of the world. This strong growth in exports, combined with stable interest rates, is helping spur recovery in the developing countries.

As for the U.S. export outlook, a continued strong dollar will likely keep U.S. goods costly in foreign markets, even though domestic crop prices will be off 5 to 10 percent. Consequently, agricultural export volume is expected to increase only slightly, despite foreign economic growth and much larger Soviet grain imports.

Reduced feed costs, a moderate increase in livestock prices since fall, and a robust general economy are helping to improve livestock producers' income prospects for this year and next. Cattle and hog producers, however, continue to reduce inventories. Broiler producers are stepping up first-half production 5 to 8 percent.

Average fertilizer prices this spring could drop below last year, as plentiful supplies reduce fall-to-spring price increases. Machinery sales in 1985 are forecast at $7.35 to $7.65 billion, close to the $7.4 billion estimated for 1984. Aggregate pesticide prices are not expected to change much from last year.

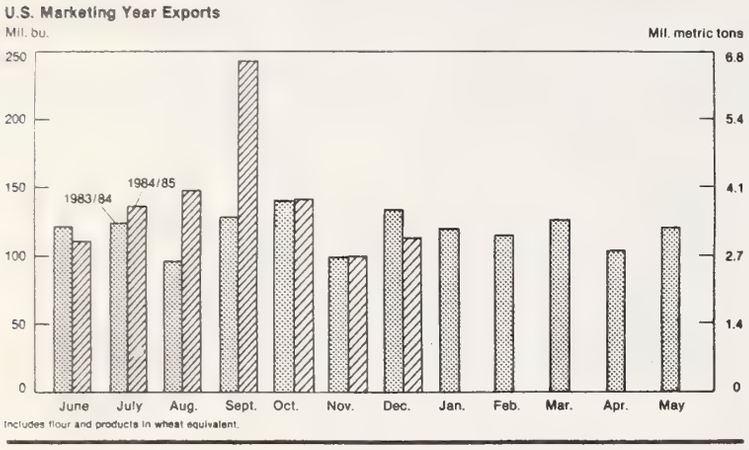
The performance of China's agriculture over the last 7 years has far surpassed the expectations of both Western analysts and China's planners. Total agricultural output expanded 49 percent between 1978 and 1984, ending growth in China's imports and making the nation an exporter in several commodities that it once imported.

U.S. DEPARTMENT OF AGRICULTURE MONTANA DEPARTMENT OF AGRICULTURE

Montana State Library
3 0864 1006 7788 2

WHEAT EXPORTS

The volume of world wheat trade for 1984/85 is expected to reach a record 107 million tons. A highly price-competitive market has caused purchasing nations to be able to readily switch buying from one exporter to another depending upon price quotes. Influenced by the high value of the U.S. dollar, U.S. exports will not expand as much as the world trade. The U.S. share of the world wheat market will slip to the lowest in 13 years--37 percent.



MONTANA DAIRY PRODUCTS UP

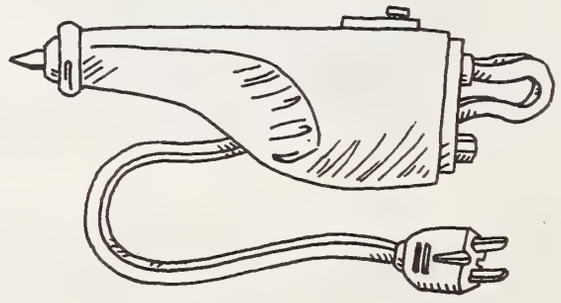
Montana dairy plants produced 158,000 gallons of ice cream in January 1985--53 percent more than the previous month and 40 percent more than in January 1984. Butter production was also above the previous month at 223,000 pounds and was about 2 percent above the previous year. January American type cheese production dropped 10 percent from the previous month but at 198,000 pounds was nearly 3 percent over last year. Creamed cottage cheese production at 386,000 pounds was 15 percent below the previous month and was 31 percent below January 1984.

OPERATION IDENTIFICATION

Farms and ranches contain many items attractive to thieves. Tools, motors, batteries, tractors and other valuable farm machinery and supplies, such as gasoline, are all things the rural criminal is eager to steal.

'Operation Identification' is a program to discourage burglary and theft by making sure your property can be easily traced to you. Here is how it works: contact your local police or sheriff's department or farm equipment dealer. They can lend you an engraving tool, or you can use an arc welder if you own one. Mark all valuables with a permanent ID number. Your local law enforcement officials can tell you what identification numbers to use. Engrave your ID number on each piece of farm equipment in two places: one in a primary location suggested by your local law enforcement officials, another in a hidden location of your choice. That way, your property can be traced even if your primary marking is removed.

Once your property is marked, make a record and store it in a safe place. Take photographs too. That way you will have double security. Then let thieves know that your valuables and farm equipment are marked by posting 'Operation Identification' stickers on all entrances to your property, mailbox, outbuildings or other clearly visible locations. Stickers are available from your local law enforcement officials.



If the **Montana Crop & Livestock Reporter** is not received by you in a timely manner, we may not have your proper or complete address. Postal regulations are becoming more rigid in terms of proper addresses. Check your address on this Reporter to see that we have the proper room, drawer, suite or building number.

FEBRUARY FARM PRICES UP

Montana farmers and ranchers received mostly higher prices for the products they sold during February than a month earlier. However, livestock prices provided the most significant increases.

The February index of prices received by Montana producers for all farm products at 155 (1977=100) was 7 points higher than the January index. The all crops index at 151 was unchanged while the livestock index at 158 was up 11 points.

Price increases during February were noted for hard spring wheat, barley, oats, hay, steers and heifers, cows, calves, lambs, hogs and eggs. Prices declined for winter wheat, durum, sheep, milk and wool.

Nationally, the February all farm products index of prices received by farmers was unchanged from January at 135 percent of its January-December 1977 average. Lower prices for lettuce, cotton, soybeans, oranges and lemons were partially offset by higher prices for cattle, hogs, sweet corn and strawberries. The index was 9 points (6.2 percent) below a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for February was 164 percent of its 1977 base. The index was unchanged from a month earlier and a year ago. Declines from a month earlier for the feed, fuels & energy and building & fencing indexes were offset by an increase in the feeder livestock index.

featuring. . . . . CUSTER COUNTY

Custer, one of the original counties of Montana, lies in the southeastern corner of the state. The county consists mainly of rolling country with pronounced breaks along the Yellowstone and Tongue Rivers. The Yellowstone River cuts through the northwestern corner of Custer county, while the Tongue River cuts the southwestern corner to join the Yellowstone near Miles City. The Powder River runs the length of the county in the eastern half.

Livestock production is the main agricultural interest in Custer County. In the January 1, 1983 cattle inventory, Custer County shared 6th place with Cascade County and 10th place with Phillips County for sheep numbers. The county came in 24th in the December 1, 1982 hog count.

The major crop grown in the area is winter wheat. However, the county ranked 23rd in production of that crop in 1983. Custer County ranked 20th for all hay production, and 8th for oats production in 1983. The corn acreage ranks number 3 in the state--exceeded only by Yellowstone and Richland Counties. Other crops grown include spring and durum wheat, and barley.

The abundant livestock production brought in $21,703,000 in cash receipts in 1982. Crops returned $11,320,000, while government payments added $974,000 for a total cash return of $33,997,000 for Custer County in 1982.

PLANTING INTENTIONS FOR 1985

Many Montana farmers and ranchers participated in a U.S.D.A. survey to determine their intentions to plant major crops for harvest in 1985. The information shown below is the result of this survey.

SPRING PLANTING INTENTIONS

Montana farmers and ranchers intend to plant 7 percent more hard red spring wheat this spring than last year. Their intended acreage is 2.25 million. Durum plantings are expected to be up sharply from the 215,000 acres planted last year. Last fall's wheat growers planted 2.5 million acres of winter wheat, down 7 percent from the 1983 fall plantings. Total wheat plantings, including winter wheat seeded last fall and farmers intentions for spring wheat add up to 5.1 million acres. This is 2 percent above last year's drought-stricken crop.

Barley plantings are expected to be down only 1 percent from 1984 record seedings. **Acreage devoted to oats** indicated only a 2 percent increase according to growers intentions on February 1. This is about a 'normal' oat acreage for Montana. **Uncertain dry bean prices** have deterred any increase in dry bean acreage. The 1985 plantings are expected to be 8,500 acres. **Corn plantings** are expected to be the same as last year, about 90,000 acres. Depending on the spring weather, farmers and ranchers expect to harvest 5 percent more **hay acreage** in 1985. The poor yields in 1984 and the low carryover will prompt ranchers to cut all available hay acreage.

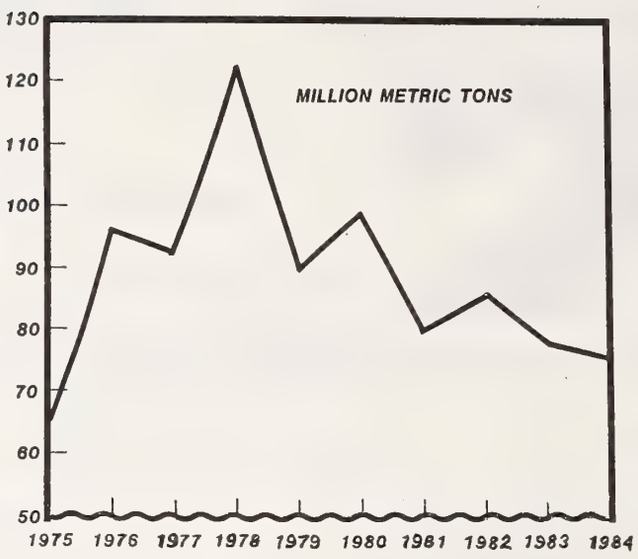
WINTER GRAIN CONDITIONS IN SOVIET UNION

Conditions for the winter grains in the USSR continue favorable. Below normal temperatures in January were accompanied by snow which protected the crop. Precipitation in the major winter wheat and rye areas in January was above normal. January temperatures in the eastern parts of the winter grain area were near normal, while in the west they were 2-7 degrees C. below normal. These coldest regions received as much as 200 percent of normal precipitation, however. In early February, the southernmost winter grain areas experienced above normal temperatures which reduced the snowcover, eliminating it entirely in some places. However, late in the first week of February, the snowcover was regained when precipitation, accompanied by lower temperatures occurred. Although the Soviet winter grain areas have been subjected to below normal temperatures this season, the crop has been protected by adequate snowcover that accompanied the cold. Also, the crop was seeded at or near the optimal time last fall and under more favorable moisture conditions than in the last three years. Winterkill should be no greater than usual. The winter grain area seeded for the 1985 harvest was 35 million hectares, according to official Soviet data.

The cold weather in January will likely have a detrimental impact on the Soviet livestock industry. The Soviet press has carried articles recently noting power outages and the lack of water supplies as the result of the weather. Should feed supplies be short in the spring, it is possible that some winter grains, that were seeded for harvest as grain, may be cut for green feed.

The 1984 Soviet grain crop estimate remains unchanged at 170 million tons, including 75 million wheat, 84 million coarse grains and 11 million miscellaneous grains and pulses. In their plan fulfillment report for 1984, the Soviets did not release any information about the grain harvest.

USSR WHEAT PRODUCTION



7 STATES CATTLE ON FEED UP 3 PERCENT

Cattle and calves on feed February 1, 1985 for slaughter market in the 7 states preparing monthly estimates totaled 8.17 million head, up 3 percent from a year ago and 1 percent above February 1, 1983.

MARKETINGS of fed cattle during January totaled 1.78 million, up 14 percent from 1984 and 9 percent above 1983.

PLACEMENTS of cattle and calves on feed during January were 1.45 million, 7 percent less than last year and 3 percent below January 1983. **NET PLACEMENTS** of 1.33 million are 10 percent less than last year and 2 percent below January 1983.

OTHER DISAPPEARANCE totaled 118 thousand head compared with 86 thousand during January 1984 and 130 thousand two years ago.

CATTLE & CALVES: NUMBER ON FEED, PLACEMENTS, MARKETED & OTHER DISAPPEARANCE
7 STATES, JAN 1 - FEB 1

ITEM	1984	1985	1985 as % of 1984
	---000 Head--		-Pct.-
On Feed Jan. 1 1/	8,006	8,617	108
Placed on Feed During Jan.	1,566	1,452	93
Fed Cattle Marketed During Jan.	1,569	1,782	114
Other Disappearance During Jan. 2/	86	118	137
On Feed Feb. 1 1/	7,917	8,169	103

1/ Cattle and calves on feed are animals for slaughter market being fed a full ration of grain or other concentrates and are expected to produce a carcass that will grade good or better. 2/ Includes death loss, movement from feedlots to pastures and shipments to other feedlots for further feeding.

JANUARY LIVESTOCK SLAUGHTER

Montana slaughter plants produced 6.1 million pounds of red meat in January, 12 percent less than December, but 31 percent more than January 1984.

Cattle slaughter numbered 9,700 head, a 21 percent increase over last year. Hog slaughter at 2,600 was up 8 percent from the previous year.

Nationally, beef production, at 2.07 billion pounds was up 8 percent. Head kill was 3.28 million, up 5 percent, and the average live weight increased 15 pounds to 1,081.

Veal production, at 43 million pounds was up 10 percent. Calf slaughter of 288 thousand head was up 4 percent and the average live weight increased 7 pounds to 247.

Pork production, totaled 1.28 billion pounds, up 4 percent. Hog kill at 7.34 million head increased 2 percent and the average live weight increased 3 pounds to 245.

Lamb and mutton production, at 32 million pounds, was up 3 percent. Slaughter totaled 557 thousand head, up 1 percent, and the average live weight increased 2 pounds to 115.

POTATO STOCKS UP

In Montana, total stocks of potatoes on hand February 1, at 1,790,000 cwt, were 8 percent above last year.

Nationally, fall potato stocks were estimated at 143 million cwt on February 1, 1985 in the 15 major states. This is up 3 percent from last year, but 5 percent short of two years ago. Variety data shows 75 percent russets, 22 percent whites and 3 percent reds in storage. The storage total represented 47 percent of fall production this year compared with 49 percent on hand a year ago at this time.

The six Western States had 93.0 million cwt of potatoes in storage, an increase of 1 percent from last February, but 5 percent less than two years ago. Idaho stocks totaling 47.5 million cwt were down 1 percent; while Washington's 20.8 million cwt storage was off 5 percent from last year. Oregon at 11.0 millin cwt was up 15 percent. Colorado with stocks of 8.90 million cwt was up 25 percent; while California storages of 3.00 million cwt were off 14 percent.

RECOMMENDED MALTING BARLEY VARIETIES FOR 1985

The American Malting Barley Association, Inc. (AMBA) announces its recommended malting barley varieties for the 1985 crop year. These varieties are recommended by AMBA for malting and brewing. When grown in the states and areas recommended and when delivered to market in pure carlots of sound, bright, plump, low moisture barley in an acceptable protein range these varieties may command premium prices over feed barley.

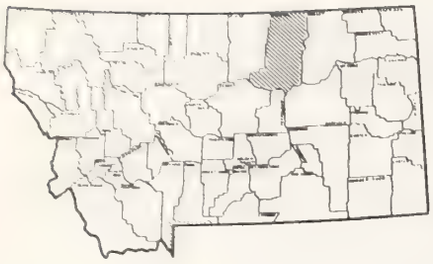
*featuring. . . . .*PHILLIPS COUNTY



Phillips County occupies 3,283,411 acres of rolling prairie in north central Montana. The entire southern boundary of the county is comprised of portions of the Missouri River and Ft. Peck Lake. Portions of the Charles M. Russell and UL Bend National Wildlife Refuges lie along the banks of the Missouri River and Ft. Peck Lake in southern Phillips County. The Milk River crosses west to east through the center of the county, and the northern boundary of Phillips County makes up a portion of the Montana/Canadian border.

Phillips County is an extensive livestock producing area. The county ranked 8th in the January 1, 1983 cattle numbers, and 10th in the sheep inventory for the same date. Hog production brought the county 20th place in the December 1, 1982 hog inventory.

Phillips County is also a vital crop producing area. It ranked 1st in oats production, 8th in spring wheat production, 10th in all hay production and 15th in barley production in the the 1983 crop figures. A fair amount of winter and durum wheat are also grown in the area.

Livestock and products returned $ 17,067,000 in 1982, while crops receipts added $20,389,000. Government payments brought in $2,752,000 for a total cash return of $40,208,000 in 1982.

MONTANA CATTLE INVENTORY DOWN

Cattle inventory has been declining for 3 years across the nation and this year Montana joined the reduction with a 6 percent cut in total cattle and calf numbers. For Montana, the class showing the sharpest decline is heifers being held for herd replacement. They are down 22 percent. The category at the other end of the scale is steers 500 pounds or more showing a 13 percent increase over 1984.

Cows and heifers that have calved are 8 percent below last year. Calves weighing less than 500 pounds are down 2 percent from January 1984.

The net affect of these changes is a larger portion of the inventory in young market animals, calves, steers & heifers, and a smaller portion for stock cattle.

SHEEP NUMBERS DOWN AGAIN

Montana's sheep and lamb inventory continued to shrink in 1984. The January 1, 1985 survey of wool growers shows 515 thousand sheep and lambs on hand, 9 percent fewer than one year ago. The decline is even more significant when lambs on feed are excluded from the count. Producers and feeders had 45 thousand lambs on feed--32 percent more than last year.

Stock sheep were 470 thousand, 11 percent fewer than last year. Ewe lambs were down 17 percent at 60 thousand and ewes one year old or older were 10 percent below January 1984 at 390 thousand.

The national pattern was very similar to Montana. All sheep and lambs were down 9 percent. Ewe lambs were down 18 percent. However, lambs and sheep on feed were down 7 percent for the nation, in contrast with the 32 percent increase for Montana.

MONTANA CROP VALUES

Montana farmers and ranchers harvested crops valued at 842 million dollars in 1984--16 percent below 1983. The sharp decrease in value was a combination of lower prices and a major drouth which cut back production.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 455,000 pounds of creamed cottage cheese in December 1984, 2 percent less than November and about the same as December the previous year.

American cheese output at 291,000 pounds was 83 percent above the previous month and 11 percent more than December last year.

Butter production fell off 9 percent from the previous month totaling 160,000 pounds and was 32 percent below the same month a year ago.

Ice cream totaled 103,000 gallons, 24 percent less than the previous month but 5 percent more than last year.

CHICKEN INVENTORY UP

Montana chicken numbers and value both increased in 1984. The December 1, 1984 inventory was 1.025 million chickens, 9 percent above one year ago. The average value per bird was $2.00, compared with $1.95 for the previous year. Total value of the Montana chicken flock was $2.05 million compared with the 1983 value of $1.83 million--a 12 percent increase.

MONTANA
1984 CROP SEASON REVIEW

The 1984 crop season was plagued with drought conditions in much of the important grain producing areas of the state. As a result, total small grain production was down 24 percent from 1983 and 37 percent from 1982.

Starting in the fall of 1983 winter wheat seedings were delayed by lack of moisture. Limited moisture in early October helped get the crop started, but many areas in the north central and northeast remained very dry. Winter moisture was below average in most of the eastern areas of the state.

A relatively dry spring enabled seeding operations to be completed a little ahead of normal. Most areas of the state were short of moisture by the end of May except the northwest, southwest and south central. The hay crop got off to a very slow start due to the dry spring and yields were sharply reduced.

Much needed moisture came to most of the state during the second week of June and generally continued throughout the month. Crops in the drier parts of the state got a boost and were rated in fair condition.

However, by the first of July hot, drying winds were prevalent over much of the northern and eastern areas of the state which rapidly depleted moisture and put stress on grain crops. July and August were generally hot and dry. Crop conditions over much of the north central and northeast areas deteriorated and final yields were much below average in those areas.

The central part of the state received enough moisture to enable a fair crop to be harvested while the western and southern parts had excellent crops. The dry weather did enable hay and grain crops to be harvested in a timely manner.

Harvesting of winter wheat was mostly complete by the end of August and spring grain harvest was wrapped up by the middle of September. The corn silage harvest progressed slightly ahead of the normal pace and was about complete by mid-October. Harvest of dry beans, potatoes and sugarbeets was essentially complete by the end of October.

WHEAT UTILIZATION

Montana wheat shipped to out-of-state destinations in the 1983 marketing year (June 1983-May 1984) is estimated at 142.9 million bushels. This is 91 percent of total disappearance. The amount shipped to the Pacific Northwest was 129.9 million bushels--about 3 percent less than in the 1982 marketing year.

Montana wheat milled for flour in the Pacific Northwest was up 5 percent. The amount exported to overseas destinations from Pacific Northwest ports declined about 4 percent from the previous year. However, Montana increased its share of total hard red wheat and durum exported from the Pacific ports going from 53 percent in 1982 to 61 percent in 1983. The reason for the increase was that hard red wheat and durum exports suffered a 16 percent cut while Montana wheat exports were down only 4 percent.

Over the past 5 years Montana wheat has accounted for more than half the hard red wheat and durum export volume, averaging 53 percent in that period.

MILK PRODUCTION

Montana dairymen produced 88 million pounds of milk in the October-December 1984 quarter, 1 percent more than the same period in 1983. The milk production increase occurred inspite of a 3 percent reduction in milk cows.

United States milk cow numbers were down 3 percent and milk production was off 4 percent from last year.

OCTOBER-DECEMBER MILK PRODUCTION

AREA	MILK COWS 1/ 1983	1984	MILK PROD. 2/ 1983	1984
	--Thousands--		-Million Lbs.-

1/ Quarterly average includes dry cows, excludes heifers not yet fresh.
2/ Excludes milk sucked by calves.

RED MEAT PRODUCTION

Montana slaughter plants produced 6.9 million pounds of red meat in December 1984--33 percent less than the previous month but 43 percent more than December 1983.

For the entire twelve months of 1984 red meat production totaled 62.6 million pounds, 47 percent below the 1983 total. The primary reason for this reduction was an 80 percent drop in hog slaughter. Cattle slaughter was off 7 percent from the previous year.

Nationally, commercial red meat production in December 1984 totaled 3.12 billion pounds, down 8 percent from 1983. Production during 1984 totaled 39.0 billion pounds, virtually unchanged from last year. The 1984 accumulated production percentage changes by individual components were: beef, up 2 percent; veal, up 11 percent; pork, down 3 percent; lamb and mutton, up 1 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

MORE POTATOES IN STORAGE

In Montana, total stocks of potatoes on hand January 1, at 1,830,000 cwt, were 10 percent above last year.

Nationally, fall potato stocks totaled 173 million cwt (7.84 million metric tons) on January 1, 1985 in the 15 major storage States. This is up 5 percent from last year, but 3 percent below two years ago. By variety, potatoes in storage are 72 percent russets, 25 percent whites, and 3 percent reds based on data from the 11 objective yield States. The storage total accounted for 57 percent of fall production this season compared with 58 percent last year.

The six Western States had 110 million cwt of potatoes in storage on January 1, 1985, an increase of 2 percent from a year ago, but 4 percent less than two years ago. Idaho with 54.5 million cwt and Washington with 25.9 million cwt were the same as last year. Oregon at 12.9 million cwt was up 7 percent. Colorado with stocks of nearly 11.0 million cwt was up 22 percent; while California storages totaling 3.9 million cwt were off 9 percent.

HIGHLIGHTS

1985 OUTLOOK: Food Prices, Exports
Farm Machinery, Fertilizer, Pesticide
JANUARY 1 HAY STOCKS
FARM PRICES
MT DAIRY PRODUCTS
featuring.....SWEET GRASS COUNTY

1985 FOOD PRICE OUTLOOK

Price increases for both food eaten at home and away from home have slowed in recent years. Prices for food at home, representing food purchased in grocery stores, rose more than 8 percent in 1980, but rose about 4 percent in 1984. Prices for food purchased away from home in restaurants, cafeterias, and fast food establishments were forecast to go up about 4 percent this year, compared with nearly 10 percent in 1980.

The farm value of food rose at a decreasing rate from 1980 to 1982, and the 1983 farm value of food declined 2.2 percent. This trend was partly due to rising crop production and weak domestic and foreign demand resulting from the recession and the loss of some grain export markets. This, coupled with large supplies of livestock products, depressed farm prices for several years. However, the 1984 farm value was pegged at 4 to 5 percent increase from 1983 because of higher farm prices.

Increases in the farm-to-retail price spread have also slowed in recent years. The farm-to-retail price spread accounts for about two-thirds of the retail price of food. It likely rose about 3 to 5 percent in 1984, up from 2.3 percent in 1983, but less than half the rise 3 years ago.

1985 EXPORT OUTLOOK

After reversing a 2 year decline in fiscal 1984, the value of U.S. agricultural exports is expected to drop to $36.5 billion in fiscal 1985. Lower prices will offset anticipated increases in the volume of grains and soybeans. Export volume--which dropped a million tons in 1984--is expected to rebound to 149.5 million metric tons. A strong dollar will continue to restrain exports, as will larger foreign production. The dollar will also continue to buoy imports, which are forecast to rise marginally from fiscal 1984's record $18.9 billion.

The largely export-led global recovery will likely slow in 1985. Japan is expected to remain the fastest growing foreign industrial economy, and if its growth shifts from export-led to domestic consumption, import needs will strengthen. However, comparatively little growth is likely in Europe, and unemployment there may grow before it declines. Conditions in developing countries are improving, but are hampered by weak commodity prices, high interest rates, and continued debt problems. Like last year, both the world's strongest economic growth and the highest increases in demand for U.S. farm products will be in Asia.

FARM MACHINERY OUTLOOK

U.S. farmers likely purchased about $7.4 billion of farm machinery in 1984. Annual nominal expenditures for farm machinery have declined 37 percent since 1979 and have been at depressed levels during the past 3 years. With farm finances not expected to improve next year, domestic demand for farm machinery could drop slightly from the 1984 estimate. Depending on interest rates, expenditures for farm machinery are projected to range from $7.3 to $7.8 billion in 1985.

FERTILIZER

No dramatic changes in fertilizer consumption, supplies, or prices are anticipated in 1984/85. U.S. fertilizer consumption reached a record high in 1980/81, then declined about 23 percent over the next 2 years. Fertilizer use rebounded in 1983/84, as crop acreage increased after the PIK cutback. A leveling off in crop acreage and small increases in application rates will keep 1984/85 plant nutrient use close to the previous year's level.

PRICES: ONLY SMALL ADVANCES LIKELY IN 1985

Generally, fertilizer prices have followed a pattern similar to consumption. Prices stabilized or declined as comsumption dropped during 1981/82 - 1982/83. With the recovery in fertilizer consumption during 1983/84, fertilizer prices in May 1984 were 7 percent higher than a year earlier. Overall, fertilizer prices in spring 1985 should show only a small advance from 1984 because of a relatively stable supply-demand situation.

1985 PESTICIDE OUTLOOK

Pesticide use is directly affected by planted crop acreage and the weather during the growing season. Actual 1985 crop acreage will be determined primarily by market developments and farmers' participation in commodity programs. Current projections are that crop acreage next season will be similar to 1984 or slightly higher.

U.S. farm demand for pesticides on major field crops could range from 500 to 545 million pounds (active ingredients) in 1985, compared with an estimated 505 to 510 million in 1984.

Herbicide use could range from 430 to 470 million pounds. Corn production will account for 55 percent of the herbicides used, followed by soybeans at 28 percent. In 1982, 95 percent of the corn acreage and 93 percent of the soybean acreage was treated with herbicides.

Insecticide use is forecast at 65 to 70 million pounds in 1985. Corn farmers are projected to apply about 30 million pounds, primarily for corn rootworm larvae control. Between 1971 and 1982, farmers annually treated 35 to 40 percent of corn acreage with insecticides.

HAY STOCKS BELOW LAST YEAR

Hay stocks on January 1 on Montana farms and ranches totaled 3,100,000 tons--down 19 percent from the same date last year and the lowest January 1 stocks since 1962. The 1984 hay crop was much smaller than normal due to the drought. Poor grazing conditions last summer and fall resulted in the feeding season starting much earlier than usual. Cooler than average temperatures during December also increased feeding requirements resulting in a depletion of hay supplies earlier than usual. Virtually all livestock were receiving supplemental feed by the first of January.

The U.S. hay stocks on farms January 1 totaled 101 million tons, 13 percent more than January 1, 1984 but 3 percent less than January 1, 1983.

MONTANA DAIRY PRODUCTS

Montana dairy plants produced 463,000 pounds of creamed cottage cheese in November--down 17 percent from October and down 6 percent from the same month last year. Ice cream production totaled 136,000 gallons, down 8 percent from the previous month, but 5 percent more than November 1983. Butter production at 176,000 pounds was 1 percent below the previous year. American cheese output was down 10 percent at 159,000 pounds.

AG PRICES DROP

Montana farmers and ranchers received lower prices for most grains in December compared with November, while livestock prices strengthened during the same period. The December index of prices received by Montana farmers for all farm products at 142 (1977=100) was down 1 point from the November index. The all crops index at 147 was down 3 points while the livestock index at 137 was up 1 point.

All grain prices went down during December except spring wheat which went up slightly and barley which remained the same. Compared with a year ago in December all grain prices except oats are lower priced. Hay is higher than both last month and last year. All livestock and products except lambs and eggs are higher in price than a month ago. Milk remained steady. Compared with a year ago, all livestock and products were higher priced except cows and eggs.

Nationally, the December all farm products index of prices received by farmers decreased 3 points (2.2 percent) from November to 134 percent of its January-December 1977 average. Lower prices for oranges, cotton, soybeans, broilers and milk were partially offset by higher prices for hogs, cattle, hay and turkeys. The index was 6 points (4.3 percent) below a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for December was 164 percent of its 1977 base. The index was unchanged for the second consecutive month. Declines in the feed, fuels and fertilizer indexes were offset by the increase in the feeder livestock component. Compared with a year earlier, the index was up 1 point (0.6 percent).

featuring. . . . SWEET GRASS COUNTY

Sweet Grass County occupies 1,218,214 acres of land in the south central portion of Montana. The Yellowstone River flows from west to east through the center of the county. The Boulder River enters the county from the south and joins the Yellowstone River at Big Timber. The northwest corner of Sweet Grass County contains part of the Gallatin National Forest, while another section of the same forest blankets the southern quarter of the county. A section of the Absaroka-Beartooth Wilderness is also contained in that southern portion of the county.

Livestock raising is the most prominent agricultural interest in Sweet Grass County. The county was in 3rd place in the January 1, 1983 sheep inventory. The December 1, 1982 hog count put the county in 18th place, while cattle numbers in the January 1, 1983 inventory showed Sweet Grass County in 24th place.

A variety of crops are produced in the county, although not to a great extent. In the county rankings for 1983 crop production Sweet Grass came in 19th for all hay production, 20th for oats, 39th for winter wheat--the only type of wheat grown in the county--and 43rd for barley production.

Livestock and products brought in $9,530,000 in cash receipts for 1982, while crops returned $1,441,000. Government payments added $291,000 for a total return of $11,262,000.

1985 WINTER WHEAT ACREAGE

Montana farmers planted 2.5 million acres of winter wheat this past fall for harvest in 1985--a 7 percent decline from a year ago. The severe summer drouth in much of the winter wheat area extended into early fall which delayed the start of seeding. However, scattered showers eased soil moisture shortages and seeding was completed by the end of October. In the major growing areas, new seedings were generally reported in fair condition going into winter dormancy.

Nationally, growers planted 57.6 million acres in the fall of 1984 for the 1985 crop--9 percent less than the previous year.

POTATO STOCKS UP

December 1, 1984 potato stocks totaled 201 million cwt for the 15 States making stocks estimates. This is up 5 percent from 1983 but 3 percent below 1982 holdings. Stocks account for 67 percent of fall production this year compared with 68 percent last year. Russets are the major type stored. In the 11 objective yield States, 72 percent are russets; 25 percent whites and 3 percent reds.

The **six Western States** had 125 million cwt of potatoes in storage on December 1, 1984, up 2 percent from a year earlier but 4 percent short of 1982 holdings. Present Idaho stocks at 61.5 million cwt are equal to last year; Washington stocks at 29.6 million are up fractionally, and Oregon storage of 15.2 million cwt is up 9 percent. Colorado's San Luis Valley storage was up 20 percent; but California registered 12 percent less when compared with last year.

Disappearance in the 15 States totaled 101 million cwt of potatoes so far this season, up 10 percent from last year and 11 percent above two years ago. this included 16.1 million cwt of potatoes lost to dumping, grading, shrinkage, etc., compared with 14.0 million cwt last year.

MONTANA HOG NUMBERS DOWN 14 PERCENT

Montana hog numbers are 14 percent below last year according to the December 1 survey of producers. This is the smallest inventory in 19 years, except for 1982 when the pig count was about the same as this year. Total hogs on Montana farms was 155,000 head. Breeding hogs numbered 16,000, down 24 percent from last year and market hogs 139,000, down 13 percent.

The number of pigs produced in 1984 was 248,000 head, 3 percent fewer than in 1983. The spring pig crop (December-May) at 117,000 was down 9 percent, but the fall pig crop (June-November) at 131,000 was up 2 percent.

U.S. HOG INVENTORY DOWN 5 PERCENT

Across the nation hog numbers were reduced in 1984. The December 1 inventory stood at 54.0 million, down 5 percent from last year. Hogs kept for breeding were down 6 percent at 6.9 million and market hogs were off 4 percent at 47.1 million.

The 1984 U.S. pig crop was also smaller than 1983, but was above 1982. With 86.5 million head estimated for 1984 the crop was 7 percent below last year. The spring pig crop was down 11 percent and the fall crop was down 3 percent. Looking ahead to see what may be in store for 1985, U.S. hog producers indicated they intend to farrow 5.4 million sows in December 1984-May 1985. If these intentions are carried out the farrowings will be 5 percent below 1984 and 10 percent below 1983.

MONTANA EGG PRODUCTION

Montana poultrymen produced 49 million eggs in the September-November quarter of 1984, the same as in the 1983 quarter. The average number of layers on hand in that quarter was 765,000--3 percent more than in the same quarter a year ago.

The Nation's laying flocks produced 17.2 billion eggs in the final quarter of 1984, 3 percent more than last year. The total number of layers for the quarter averaged 282 million, 3 percent above the previous year.

1984 DROUTH CUTS GRAIN CROPS

The total small grain production for Montana in 1984 was down 24 percent from last year and 37 percent under 1982. The large decrease was due mainly to a widespread drouth that covered much of the northern and eastern sections of the State. Production changes from 1983 and 1982 are:

	FROM 1983	FROM 1982
WINTER WHEAT.....	DOWN 15%	DOWN 17%
DURUM WHEAT.....	DOWN 13%	DOWN 64%
OTHER SPRING WHT..	DOWN 36%	DOWN 62%
ALL WHEAT.....	DOWN 24%	DOWN 42%
OATS.....	DOWN 26%	DOWN 49%
BARLEY.....	DOWN 24%	DOWN 23%
TOTAL SMALL GRAINS	DOWN 24%	DOWN 37%

NATIONAL PRODUCTION UP

All wheat production for the Nation at 2.6 billion bushels was up 7 percent from last year but still 6 percent below the record set in 1982. Barley production at a record high 597 million bushels was up 17 percent.

End-of-season statistics for all other crops will be released January 25, 1985.

1984 ANNUAL SUMMARY OF SMALL GRAINS

MONTANA LIVESTOCK SLAUGHTER

Montana slaughter plants produced 10.2 million pounds of red meat during November. The November production was 26 percent higher than last month and 110 percent higher than last November. However, total production through the first 11 months of the year was down 51 percent from a year ago, primarily due to a sharp reduction in hog slaughter.

The November slaughter consisted of 15,000 cattle, 13,000 hogs, and 300 sheep. In terms of total liveweight, the cattle slaughter was up 80 percent and the hog slaughter was up 349 percent from last year.

NATIONAL SLAUGHTER

Commercial red meat production for the United States in November 1984 totaled 3.32 billion pounds, down 4 percent from November 1983. January-November red meat production, at 35.9 billion pounds, was up 1 percent from last year. The 1984 accumulated production percentage changes by individual components were: beef, up 2 percent; veal, up 12 percent; pork, down 2 percent; lamb and mutton, up 1 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

Kill days for November 1984 included 22 weekdays (two were holidays) and four Saturdays. Kill days for November 1983 consisted of 22 weekdays (two were holidays) and four Saturdays.

Comparing November 1984 with November 1983:

BEEF PRODUCTION, at 1.92 billion pounds was down 1 percent. Head kill was 3.08 million, up fractionally; however, the average live weight declined 5 pounds to 1,072.

VEAL PRODUCTION, at 43 million pounds was up 10 percent. Calf slaughter of 298 thousand head was up 1 percent, and the average live weight increased 13 pounds to 242.

PORK PRODUCTION, totaled 1.33 billion pounds down 10 percent. The 7.60 million head killed declined 10 percent, but the average live weight, at 246 pounds was unchanged.

LAMB and MUTTON, at 30 million pounds was up 3 percent. Slaughter totaled 540 thousand head, up 2 percent, and average live weight increased 2 pounds to 113.

WHEAT SITUATION

As 1984 brings in the third largest U.S. wheat harvest ever, the current outlook reflects a season of record supplies, near-record disappearance due to strong exports, and prospects for the lowest national farmgate price in 5 years.

Harvested area in 1984 increased 8 percent and the average yield per acre was only 0.6 bushel lower than 1983's record 39.4. This put the crop at 2.57 billion bushels, up 150 million from a year ago. The increase was sufficient to offset reduced carryin stocks, and to place 1984/85 U.S. wheat supplies at a record of just under 4 billion bushels.

Disappearance in 1984/85 may be much stronger than expected at the outset of the season. Exports and sales since mid-July are up 26 percent from last year, primarily because of heavy shipping to the USSR and China, the two major U.S. wheat customers. Soviet commitments are up more than a third from last year, suggesting the second largest U.S./USSR wheat trade since 1972/73, when the first major grain trade between the two countries took place. Chinese buying accelerated at harvest, but has lagged from earlier expectations, principally because of another record Chinese crop. Total U.S. wheat exports for the season are forecast at 1.53 billion bushels, up 7 percent from last season and the second strongest in history.

CHRISTMAS GREETINGS

The disasterous crop year, low farm prices for grain and cattle and the financial problems facing many farmers and ranchers make writing an upbeat Christmas letter somewhat difficult this year. But, problems are relative. We have suffered through bad years and faced crisis situations before. Hopefully, the problems are being recognized and will be addressed with feasible solutions.

Our problems here in Montana are painful to many but not life threatening such as those that face our African neighbors. Imagine the helpless feeling of watching you children and loved ones die from the pain and misery of starvation. Even in the worst of cases few people in this country go hungry.

We are indeed fortunate to be blessed with favorable natural resources and an abundant food supply. But the farmers and ranchers who have invested their lives and fortunes to produce our food are not receiving adequate compensation. The percent of disposable personal income spent for food in the U.S. has now dipped to slightly over 15 percent, down from nearly 16 percent in 1983. This is by far the lowest percent in the world today and clearly not enough to support a healthy agricultural industry.

Those of us who collect data and provide information about Montana agriculture thank you for your support and wish you a Merry Christmas and Happy New Year.

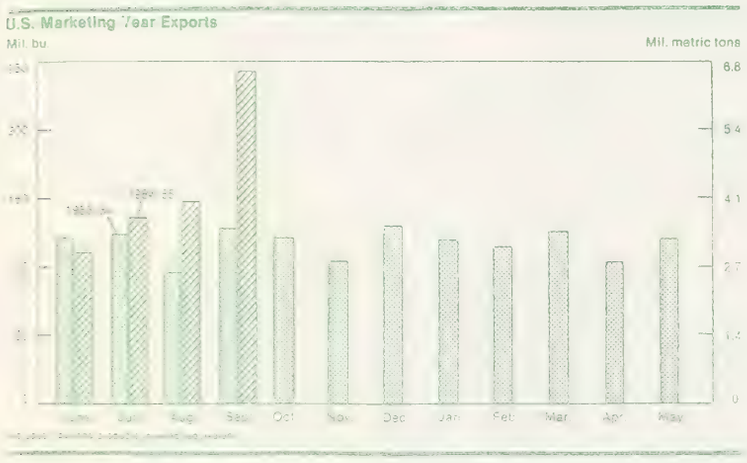
(CONTINUED)

Contributing to increased domestic disappearance was heavy early season use of wheat for feed. Short feed grain and plentiful wheat supplies during June-September upset the more typical premium prices of wheat over feed grains, resulting in record amounts of wheat being fed to livestock and poultry. The current large 1984 feed grain output, however, should turn this situation around, limiting wheat feeding for the rest of the season. Wheat feeding for 1984/85 will be down slightly from a year ago.

Despite the encouraging outlook for demand, large supplies and the reduced loan rate dampen price prospects. Average farm prices during June-September were $3.40 a bushel, compared with $3.53 last year. For all of 1984/85, the season-average farm price may fall below last year's $3.54 a bushel, settling between $3.35 and $3.55.

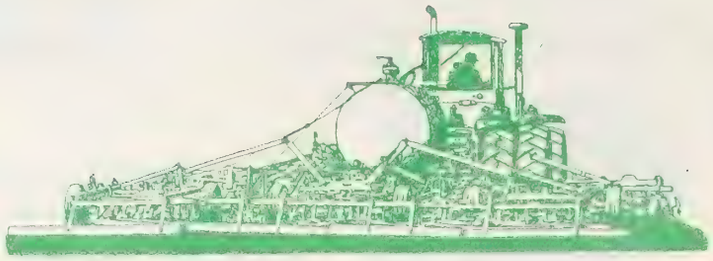
WHEAT EXPORTS



SOURCE: OUTLOOK & SITUATION REPORT--NOVEMBER 1984

MONTANA DAIRY PRODUCTS

Montana dairy plants produced 555,000 pounds of creamed cottage in October--11 percent more than September and 9 percent above the same month last year. Ice cream production moved down seasonally from the previous month but was 7 percent above last year at 148,000 gallons. Butter production moved up from September and was 12 percent above a year ago. American cheese was down seasonally but remained 4 percent above last year's output for October.



MONTANA FERTILIZER CONSUMPTION UP 15 PERCENT

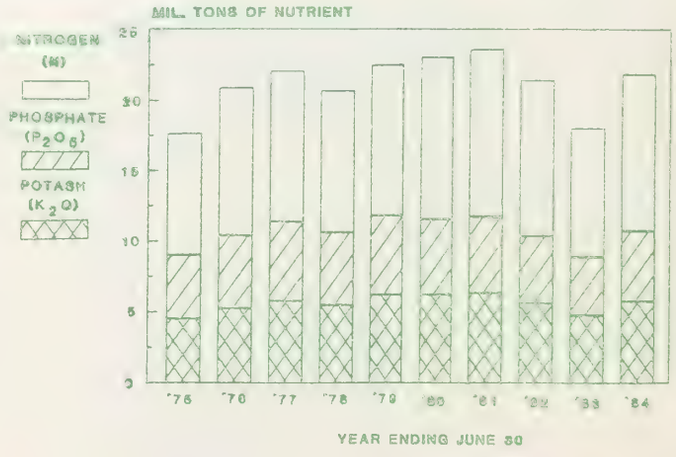
Montana farmers applied 463 thousand tons of fertilizer in the year ended June 30, 1984, an increase of 15 percent over the previous year. Ammonium nitrate lead the advance with a 25 percent increase. Ammonium sulfate and aqua ammonia were each up 15 percent, while Nitrogen solutions fell off 9 percent. Urea was up 12 percent from last year, and other nitrogen material was up 11 percent.

Phosphate materials in the form of ammonium phosphates were up 21 percent from a year ago. Superphosphates were down slightly while other phosphates were up 33 percent but still represent only 5 percent of total phosphate material.

Fertilizer consumption by farmers across the whole nation was up 20 percent from a year ago with 50.2 million tons used in the year ended June 30, 1984. Inspite of the large increase, usage is still 7 percent below the record set in 1981.

UNITED STATES

PLANT NUTRIENT CONSUMPTION



NOVEMBER FARM PRICES

Montana farmers and ranchers received mostly lower prices in mid-November compared with October but many items remained above last year's level. The November index of prices received by Montana farmers was 139 percent of the 1977 average, down 6 points from October and 2 points below last year's November index.

Except for oats, all crop items moved down from October or were unchanged. By contrast all livestock items moved up except for cows and calves. The mid-November cow price averaged $30 per cwt, the lowest level since January 1978. This is the 5th consecutive year that the November cow price has been below the previous year. Although the calf price fell off from October, the average was still 80 cents per cwt above last November. Steer and heifer prices were unchanged from October but $1.00 above a year ago.

Sheep, lambs, hogs, milk and wool were considerably higher than last year and that strength seems to be holding as the mid-November prices were above or unchanged from October.

Looking at crop items, oats are the only commodity showing an increase from October to November. Even after the October to November decline all crop prices except durum and winter wheat are above last year at this date.

Nationally, the November All Farm Products Index of Prices Received by Farmers decreased 1 point (0.7 percent_ from October to 137 percent of its January-December 1977 average. In the Index, lower prices for oranges, lettuce, corn, grapefruit and tomatoes were partially offset by higher prices for hogs, eggs, cattle, potatoes and turkeys. The index was 2 points (1.5 percent) above a year ago.

The Index of Prices Paid by Farmers for Commodities and Service, Interest, Taxes, and Farm Wage Rates for November was 164 percent of its 1977 base. The index was unchanged from October. Declines in the feeder livestock and fuels & energy indexes were offset by increases in the family living and autos & trucks components. Compared with a year earlier the index was up 2 points (1.2 percent).

featuring. . . . . RICHLAND COUNTY

Richland County occupies 1,332,096 acres of rolling prairie along the Montana/North Dakota border in northeastern Montana. The entire northern boundary of the county is defined by a section of the Missouri River, while the Yellowstone River cuts across the southeastern corner. Richland County was created in May of 1914 and claims Sidney as the county seat. The average precipitafor the area amounts to 13.86 inches.

Farming, and most of it dryland, is the main agricultural interest in the county. It was the second largest oats producer in the state in 1983. Wheat is another major crop as the county ranked 12th in spring wheat production, 16th in durum wheat and 17th in winter wheat production in the 1983 crop production tally. Barley and hay are also raised and brought the county rankings of 22nd and 29th, respectively, in 1983.

Hog raising has been the main livestock interest as Richland county came in 19th in the December 1, 1982 hog inventory. In the January 1, 1983 sheep and cattle inventories the county came in 23rd and 27th, respectively.

Crop production in 1982 returned $38,117,000 to Richland County, while livestock and livestock products brought in $27,520,000. Government payments added a total of $3,809,000 for a final return of $69,446,000 total cash receipts in 1982.

HOGS

The September **Hogs and Pigs** report indicated that producers continued to cut back production as planned this summer, and they intend to have fewer sows farrow this fall and winter than a year ago. Hog prices averaged lower this summer than previously expected, but feed costs moderated. Nevertheless, producer returns were above breakeven for only a brief period this summer, the first time in a year. If producers carry out their intentions of having fewer sows farrow during September-February, pork production will decline on a year-over-year basis through at least spring 1985. Smaller pork production, along with lower beef output because of the reduced inventory, should result in higher hog prices. However, greater broiler production will be a price-weakening factor.

DROUGHT and LOW RETURNS HAVE BOOSTED CATTLE SLAUGHTER

Drought and financial difficulties have plagued the beef cattle industry for more than a year. After producers adjusted cow herds because of drastically reduced forage supplies last fall, severe winter storms necessitated increased supplemental feeding and thus brought further reductions in herds. Some additional beef cows may have been slaughtered late last fall as producers became apprehensive about lower prices in 1984.

The farm price of cattle fell to $56 per cwt n 1983, following a high of $66 per cwt in 1979. Prices for feeder steers at Kansas City fell from a 1979 average of $83 to $64 in 1983. Cash costs remained relatively stable through the 4 year period. Thus, net returns on cow-calf operations fell sharply in 1981, 1982 and 1983.

The decline was probably relatively uniform for different size operations. From 1981 through 1983, the units of less than 100 head lost money, as did medium-size operations (100-499 head) in 1983. This is unlikely to change for the smaller units during 1984. Larger operations (greater than 500 head) were able to meet cash expenses during 1981-83, but with a much smaller net margin than they had enjoyed earlier. Returns to both of the larger groups are likely to exceed cash expenses in 1984.

In 1982, over two-thirds of U.S. beef cows were in herds of less than 500. Most of the 100-head-or-under operations were complementary enterprises on crop farms. Many of these operations have had to cut back their herds to raise cash.

Agricultural lending has also gone through significant changes. Deregulation and tighter monetary policy have led to higher interest rates. Together with declining land values, higher interest rates have made it more difficult for producers to service debt against their operations. At the same time, agricultural lenders, particularly commercial banks, have become more cautious when considering new loans and more demanding for payment on existing loans. Consequently, highly leveraged operators faced with a cash flow problem have probably been selling some cows to meet their loan obligations.

U.S. DEPARTMENT OF AGRICULTURE
MONTANA DEPARTMENT OF AGRICULTURE

Montana State Library
3 0864 1006 7796 5

Commercial lamb and mutton production dropped below year-earlier levels this summer, after being above in first-half 1984. Although the inventory of all sheep and lambs on January 1 was down 5 percent, the rate of slaughter was above a year before because poor forage conditions, especially in Texas, caused herd liquidation. Third-quarter production likely totaled 88 million pounds, down 6 percent from a year earlier. During January-August, mature sheep slaughter as a percentage of total slaughter was 8.1 percent, compared with 7.2 percent in the same period last year. Production in the fourth quarter is projected at 80 million pounds, a 12 percent decrease from a year ago.

Lamb and mutton production for all of 1984 is forecast at 358 million pounds, down 2 percent from 1983. Production in 1985 is projected at 320 million pounds, down 11 percent from 1984 because of the herd liquidation since 1982.

Lamb prices have rallied as production has declined on a year-over-year basis. Wholesale lamb prices were sharply higher this summer and exhibited more strength than prices of the other red meats. Choice lamb at San Angelo averaged $61 per cwt this summer, $2 less than in the spring, when prices are seasonally high. Since the seasonal price decline did not materialize this summer, lamb prices in the fourth quarter are projected to average $64 to $68 per cwt, compared with $58 a year ago. For all of 1984, lamb prices are expected to average $62 to $63 per cwt, compared with $58 in 1983. For all of 1985, prices may average $63 to $70, because of the expected price strength throughout the red meat complex.

CATTLE ON FEED IN 7 STATES UP

Cattle and calves on feed November 1 for slaughter market in the 7 States preparing monthly estimates totaled 8.22 million, a 7 percent increase from a year ago and 1 percent above November 1, 1982.

MARKETINGS of fed cattle during October totaled 1.66 million, an increase of 2 percent from last year and up 9 percent from October 1982.

PLACEMENTS of cattle and calves on feed in the 7 States were 2.55 million, up 3 percent from October 1983 but 2 percent below two years ago. **NET PLACEMENTS** of 2.44 million were up 3 percent from 1983 but 3 percent below 1982.

OTHER DISAPPEARANCE totaled 110 thousand compared with 102 thousand during october 1983 and 83 thousand two years ago.

NUMBER OF HIRED WORKERS DOWN--WAGES HIGHER

During the week of October 7-13, 1984, 3.2 million people were working on farms and ranches in the United States. This includes workers hired directly by the farm operators and agricultural services employees working on farms. This is down 20 percent from July and down 16 percent from October 1980, when the last comparable farm labor survey was conducted. Hired workers represented 37 percent of the total. Of these workers, 1.02 million were hired directly by the farm operators which was 29 and 22 percent fewer than in July 1984 and October 1980, respectively. Farm operators and other unpaid workers who worked 15 hours or more accounted for the remaining 2.0 million workers, 12 percent below July and 18 percent below October 1980.

The wage rates for all hired workers was $4.56 per hour, up 9.6 percent from July and up 18 percent from October 1980. The wage rate for workers paid on an hourly basis was $4.45, up 33 cents from July. In October 1980, the wage rate for hourly paid workers was $3.81. Wage rates by categories of workers were: field $4.40, livestock $4.12, and piece rate $5.32.

During the October 7 - 13, 1984 survey week, the self-employed farm operator worked an average of 43.1 hours, 5.1 hours less than in July, but 1.4 hours more than in October 1980. The unpaid workers on farms averaged 36.4 hours for the week, down 4.4 and 2.8 hours from July 1984 and October 1980, respectively. Hired workers averaged 40.2 hours, 3.4 hours more than in July and 0.1 hour more than in October 1980.

FARM ELECTRICITY and TELEPHONE COSTS GO UP

Montana farmers and ranchers paid an average of $64.00 per month during mid-1984 for electric service charges. This represents a 14 percent increase from last year's average monthly costs. Usage increased about 5 percent and cost per kilowatt-hour increased about 10 percent. Telephone bills averaged $59.60 per month during mid-1984, an increase of 22 percent from last year.

Nationally, farmers and ranchers paid an average mid-summer electric bill of $97.40 in 1984 which was 5 percent above the 1983 average of $92.50. Fuel adjustment charges and taxes are included in the electricty costs. The average cost per kilowatt hour (KWH) for U.S. farmers and ranchers was 6.83 cents compared with 6.48 cents in 1983, a 5 percent increase. Usage of electricty averaged 1440 KWH per month in 1984 compared to 1427 KWH a year earlier. Monthly KWH usage was up slightly less than 1 percent. The Northwest continued to have the lowest cost per KWH which was 3.6 cents in Washington, 4.5 cents in Oregon, 4.6 cents in Montana and 4.6 cents in Idaho. The State average cost per KWH was highest in the Northeast with New Jersey, Connecticut, Rhode Island, Delaware and Massachusetts being the leaders. Usage of electricity was lowest in West Virginia and Arkansas while the highest average usage occurred in Arizona and Washington.

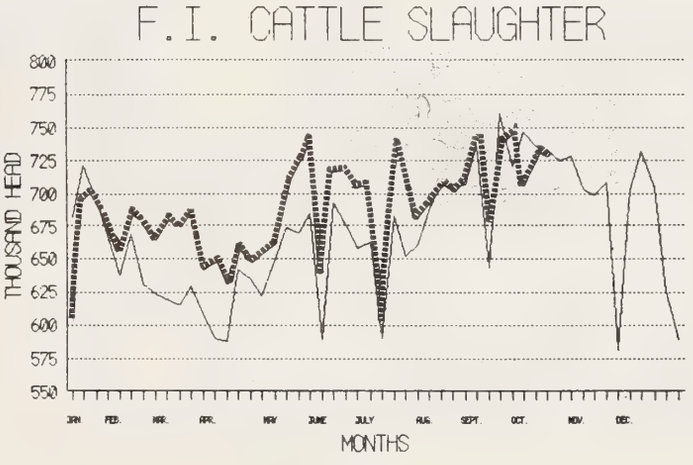
Telephone service for farmers and ranchers in the U.S. averaged $43.90 per month in 1984, up 12 percent from the 1983 average of $39.20. The monthly telephone bill includes charges for local service, long distance calls and extension telephones. The average local service was $15.60 per month in 1984 compared to $14.40 in 1983, up 8 percent.

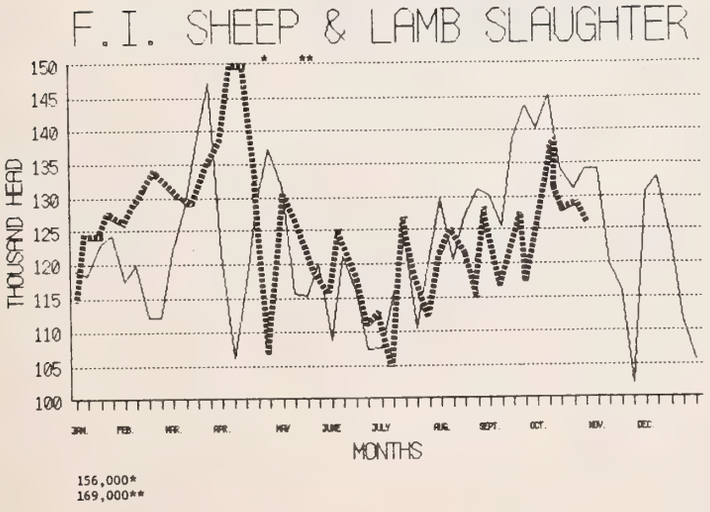
OCTOBER LIVESTOCK SLAUGHTER

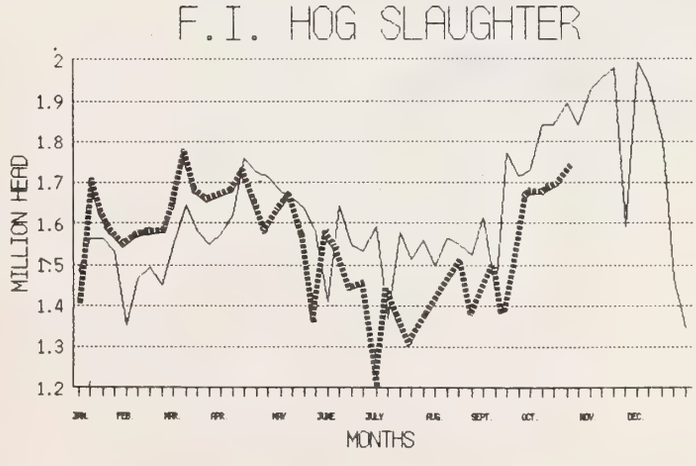
Montana slaughter plants produced 8.1 million pounds of red meat during October. The October production was 34 percent higher than last month and 3 percent higher than October 1983. Total production through the first 10 months of the year was down 58 percent from a year ago, primarily due to a sharp reduction in hog slaughter.

The October slaughter consisted of 9,600 cattle, 17,600 hogs, and 400 sheep. In terms of total liveweight, the cattle slaughter was up 2 percent while the hog slaughter was up 10 percent from last year.

Nationally, commercial red meat production in October 1984 totaled 3.67 billion pounds, up 4 percent from October 1983. January-October red meat production, at 32.5 billion pounds, was up 1 percent from last year. The 1984 accumulated production percent changes by individual components were: beef, up 3 percent; veal, up 13 percent; pork, down 1 percent; lamb and mutton, up 1 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.







*featuring. . . . .*GLACIER COUNTY

Glacier County was created in April of 1919. It occupies 1,916,454 acres of north central Montana. The Canadian border defines its northern boundary, and the crest of the main range of the Rocky Mountains its western boundary. Cut Bank is the county seat and this area has an annual average precipitation of 11.99 inches. Nearly one half of Glacier National Park lies within the county's boundaries as the western border of Glacier County runs down the center of the park. The rugged mountains in the west give way to sloping plains in the eastern portion of the county. The Blackfeet Indian Reservation occupies all but the extreme eastern edge of the rest of the county. The east-west length of Glacier County is traversed by the Milk River, Cut Bank Creek and the Two Medicine River.

The main agricultural industries in the county include hog raising--for which the county ranked 4th in the December 1, 1982 inventory--also barley and spring wheat production for which Glacier County ranked 6th and 10th, respectively. Some cattle and sheep are also raised, while other crops produced include durum and winter wheat, oats and hay.

Crops contributed the greatest amount in cash receipts with $28,683,000 in 1982. Livestock and livestock products brought in $9,466,000 and government payments added $4,615,000 for a total cash return of $42,764,000, and a rank of 17th for total cash receipts in 1982.

AGRICULTURAL FINANCE SURVEY

The problem of agricultural credit and the depressed agricultural economy is a major issue of deep concern to farmers and ranchers, agricultural leaders and lending institutions in the state of Montana. The 1984 drouth and other natural disasters have created additional financial stress.

Two surveys were conducted to help identify the extent and severity of agricultural credit problems in Montana. Questionnaires asking about farm credit were sent to about 1,500 farmers, all 175 commercial banks, the Farm and Home Administration (FmHA), Production Credit Associations (PCAs), and Federal Land Banks (FLBs). Non-respondents were contacted by telephone.

RESULTS OF FARM OPERATOR SURVEY

Results of the farm operators survey show that 18 percent of Montana farmers are delinquent on real estate loan payments. A breakdown shows that about half of those have been able to stay current on interest payments only. The delinquency rate is somewhat higher among farms of less than a thousand acres, averaging 25 to 29 percent.

ONLY 7 OUT OF 10 CURRENT ON OPERATING LOANS

For non-real estate or loans used to purchase operating equipment and supplies 31 percent of the state's farmers are delinquent in their payments. However, 61 percent of those are current on interest payments only. All sizes of operations seem to be having trouble keeping current on operating loans, but those under 1,000 acres in size are running above average on delinquency, while those between 1,000 and 2,000 acres are below average.

LOAN DELINQUENCY RATE BY SIZE OF FARM

SIZE OF FARM	REAL ESTATE LOANS DELINQUENT	NON-REAL ESTATE LOANS DELINQUENT
-Acres-	--------Percent--------	
499 or Less	25.0	31.8
500-999	28.6	37.5
1,000-1,999	14.3	24.5
2,000-2,999	18.8	34.1
3,000-4,999	13.6	32.1
5,000-9,999	8.6	31.8
10,000 +	12.7	28.3
STATE TOTAL	17.6	30.6

Interest rates averaged 10.4 percent for real estate and 13.9 percent for non-real estate loans. Six percent of the survey respondents had been denied credit between January and September 1984. About 4 out of 10 were able to obtain credit elsewhere.

OCTOBER FARM PRICES

The October index of prices received by Montana farmers declined 2 points from September but is still 3 points above last year. The index at 146 percent of the 1977=100 average was pulled down by a drop in both the crops index and the livestock index.

Crops showed mixed changes with spring wheat and barley down; winter wheat, durum and oats up, and hay unchanged. Livestock and livestock products were down except cows and milk were up and wool was unchanged.

The October all farm products index of prices received by U.S. farmers decreased 1 point from September to 138 percent of its January-December 1977 average. Lower prices for cattle, hogs, corn, broilers, and eggs were partially offset by higher prices for oranges, grapefruit, milk, lettuce and strawberries. The index was 4 points (3.0 percent) above a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for October was 164 percent of its 1977 base, down 1 point (0.6 percent) from September. Prices for feed and fertilizer were lower. Higher prices for feeder cattle and calves and diesel fuel were partially offsetting. The index was up 3 points (1.9 percent) from a year earlier.

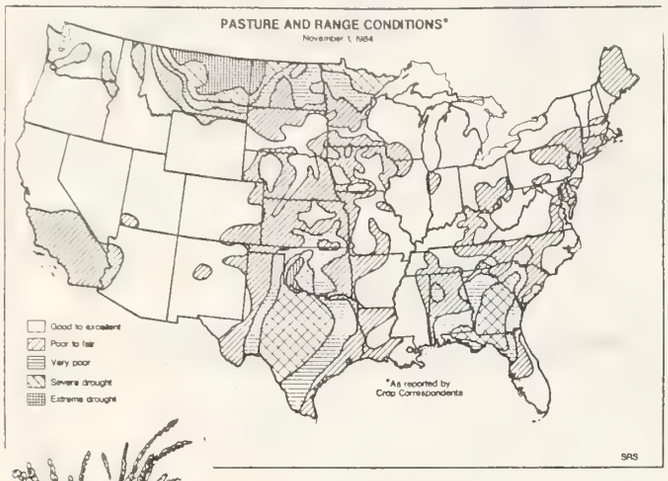
PASTURE & RANGE

Montana's pasture and range condition on November 1 was 56 percent of normal--up 3 points from October 1 but down 17 points from a year ago. Many ranges received some moisture during October, but it came too late to stimulate growth. Hay supplies are short in much of the eastern portion of the state, and due to limited grazing, the hay feeding season will start earlier than normal.



HAPPY

THANKSGIVING!

THAT TIME OF YEAR AGAIN

Throughout the 1984 crop year the Montana Crop and Livestock Reporting Service has been making monthly production forecasts for the major crops. As the harvest season has ended, plans to obtain final 1984 data on acreage, yield and production are underway.

More than 10,000 Montana farmers and ranchers were mailed a questionaire the last of October asking for information on crop acreage and production by cropping practice.

Telephone calls will be made to a sample of producers who fail to respond by mail to assure adequate coverage and accurate results. It is from this annual acreage and production survey that county and state estimates are developed. Such figures are important in providing an accurate picture of crop production for each county and for Montana.

Similar surveys will be conducted in other states and final state and national survey results will be published for small grains on December 20, 1984.

HIGHLIGHTS

MONTANA & U.S. GRAIN STOCKS
SLAUGHTER DECREASES
MILK PRODUCTION UNCHANGED
CATTLE ON FEED NUMBERS INCREASE
NEW FARM CREDIT INITIATIVE (back page)

MONTANA WHEAT STOCKS DOWN

Stocks of wheat in Montana on October 1, 1984 in all storage positions totaled 161.3 million bushels--down 21 percent from a year ago and the lowest October 1 stocks since 1975. Wheat stored on farms accounted for 80 percent of the total with the remainder in commercial storage. Disappearance of wheat since June 1 totaled 38.7 million bushels--18 percent less than a year ago.

Winter wheat at 96.2 million bushels was down 14 percent from last year. All spring wheat at 65.1 million bushels was down 29 percent with the durum portion at 9.4 million, down 30 percent.

Barley stocks in all positions at 56.6 million bushels were down 18 percent. Oats at 4.9 million were down 23 percent.

NATION'S WHEAT STOCKS DOWN

Nationally, all wheat stored in all positions on October 1, 1984 totaled 2.72 billion bushels, 8 percent less than the 2.96 billion bushels stored on October 1 a year ago. Farm stocks of 1.20 billion bushels accounted for 44 percent of the total. Wheat stored off-farms totaled 1.52 billion bushels. Farm stocks are 3 percent below October 1, 1983 while off-farm stocks are down 11 percent from last year. Indicated disappearance of all wheat during June-September 1984 stands at 1.24 billion bushels, compared with 980 million bushels during the same period a year ago. Disappearance during the June-September period implies a higher feed usage than normal.

Durum wheat stocks in all positions October 1, 1984 totaled 179 million bushels, up 12 percent from the 159 million bushels on hand October 1, 1983. Farm stocks, at 127 million bushels, are 13 percent more than the 113 million bushels on hand a year earlier. Off-farm stocks, at 51.4 million bushels, are 11 percent above October 1 last year. Indicated June-September 1984 disappearance of durum wheat is 27.5 million bushels, down 45 percent from the 49.7 million bushels recorded for the comparable period a year earlier.

Barley stored in all positions on October 1, 1984 totaled 583 million bushels, 13 percent more than on October 1 a year ago and 18 percent greater than on the same date in 1982. Of the total barley stocks on hand October 1, 1984, 70 percent, or 411 million bushels was stored on farms. Farm stocks were 20 percent more than a year ago. Off-farm stocks, at 173 million bushels, were up less than one percent from last October 1 level. Indicated disappearance during June-September 1984 was 211 million bushels, 1 percent more than the corresponding period a year ago.

RED MEAT PRODUCTION DOWN

Montana slaughter plants produced 6.1 million pounds of red meat during September. The September production was 8 percent higher than the previous month but 50 percent lower than September 1983. Montana's total red meat production through the first 9 months of the year was down 63 percent from a year ago, primarily due to a sharp reduction in hog slaughter.

The September slaughter consisted of 7,700 cattle, 11,500 hogs and 400 sheep. Interms of total liveweight, the cattle kill was down 28 percent from last year, while the hog kill was down 68 percent.

Nationally, commercial red meat production in September 1984 totaled 3.11 billion pounds, down 9 percent from September 1983. January-September red meat production, at 28.9 billion pounds, is up 1 percent from last year. The 1984 accumulated production percent changes by individual components were: Beef, up 2 percent; Veal, up 13 percent; Pork, down 1 percent; Lamb and Mutton, up 1 percent. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

MILK PRODUCTION STEADY

From July through September, Montana's dairy industry saw few changes from the same period a year ago. Milk production for the quarter was unchanged at 91 million pounds. The size of the state's milk cow herd remained the same at 29,000 head. Grain and other concentrates fed was unchanged at 14.0 pounds per cow. The value of grain and concentrates, however, increased from $6.80 to $7.10 per cwt.

Nationally, milk production during the third quarter of 1984 totaled 33.6 billion pounds, 4 percent less than the third quarter of 1983. Production per cow averaged 3,104 pounds during the quarter, 41 pounds below the same quarter last year. The total number of milk cows averaged 10.8 million head for the quarter, 3 percent less than last year.

CATTLE ON FEED UP

CATTLE ON FEED October 1, 1984 in the 7 monthly States totaled 7.44 million, a 7 percent increase from the previous year and a 4 percent increase from 1982. **PLACEMENTS** in feedlots during September, of 2.27 million, were up 13 percent from last year and 14 percent above 1982. **MARKETINGS** during September totaled 1.49 million, 11 percent below 1983 and 5 percent below 1982. There were 2 less slaughter days in September 1984 than in September 1983. **OTHER DISAPPEARANCE** during September was 81 thousand head, 14 percent above last year but 2 percent below 1982.

FARM CREDIT INITIATIVE

On September 18, President Reagan, announced provisions for restructuring farm debt. The program as announced contains four provisions:

--The Farmers Home Administration (FmHA) will, on a case-by-case basis, defer 25 percent of the principal and interest payments owed by selected farmers for up to 5 years.

--Federal guarantees of $630 million are being made available to private farm lenders who agree to write off 10 percent of farm debt owed in selected problem farm situations.

--Experts from local communities will be asked to help farmers develop financial and production management plans.

--FmHA can contract out some routine paperwork to private banks and other financial institutions in order to reduce backlogs.

As of July 31, 1984, FmHA had 270,986 farm and ranch borrowers, providing approximately 11 percent of the Nation's farm credit. Of these borrowers, 31 percent are behind in their payments. For the past 3 years, however, more than 97 percent of FmHA's borrowers have been able to remain in farming. Since October 1, 1984, the Secretary of Agriculture has provided special credit assistance to 65,022 FmHA farm borrowers including deferral of loan payments, and rescheduling and subordination of liens to commercial lenders in the private sector.

HIGHLIGHTS

MONTANA & U.S. CROP PRODUCTION FORECASTS
PASTURE & RANGE CONDITION
AG PRICES FOR SEPTEMBER
featuring.....BIG HORN COUNTY

NATIONAL HIGHLIGHTS

Nationally, all wheat production is forecast at 2.57 billion bushels, up 6 percent from the 1983 total, but 7 percent less than in 1982. Durum production is expected to be 44 percent above last year, but 28 percent below 1982. Hard red spring wheat totals should be 20 percent below the record high 1982 crop. The winter wheat production forecast is up 2 percent from 1983, but down 2 percent from 1982.

Production of barley is forecast at a record 606 million bushels, up 19 percent from last year and 17 percent above 1982. Production of corn for grain is forecast at 7.50 billion bushels, up 80 percent from last year's drought-stricken crop, but 9 percent below the record high crop of 1982.

OCTOBER 1 CROP FORECAST

Montana's harvest season is nearly complete except for some late season crops. Production levels are considerably below last year because of the extended drought conditions. Production changes from 1983 are:

Winter Wheat	--	Down 15%
Hard Spring Wheat	--	Down 32%
Durum Wheat	--	Down 26%
Barley	--	Down 25%
Oats	--	Up 1%
Corn for Grain	--	Up 10%
All Hay	--	Down 11%
Potatoes	--	Up 7%
Sugarbeets	--	Down 45%
Dry Beans	--	Up 392%

By October 1 the small grain harvest was essentially complete. The corn silage harvest was 80 percent complete and the dry bean harvest 65 percent complete. Lifting of sugarbeets was just getting underway and about 40 percent of the potatoes had been dug.

PASTURE & RANGE CONDITION POOR

Montana's pasture and range condition on October 1 was 53 percent of normal--down 1 point from September 1 and down 18 points from a year ago. This is the lowest October 1 pasture and range condition since the mid-1930s. Rain and snow the last half of September softened range grasses, but came too late to improve grazing significantly.

MONTANA PASTURE & RANGE CONDITION by District as a Percent of Normal, Oct. 1

DISTRICT	1982	1983	1984

FARM PRICES

The September index of prices received by Montana farmers and ranchers for the products they sell was 151 percent of the 1977 base--up 6 points from the August index. The all crops index at 153 was unchanged from last month while the livestock and products index was up 9 points.

Price increases from August to September were noted for durum, hard spring wheat, barley, steers and heifers, calves, lambs, and milk. Prices went down for oats, hay, cows, sheep, hogs and eggs. Winter wheat and wool remained steady.

Nationally, the September all farm products index of prices received by farmers decreased 4 points from August to 139 percent of its January-December 1977 average. Lower prices for potatoes, hogs, cattle, oranges, soybeans and corn were partially offset by higher prices for milk, tobacco, peaches, broilers and apples. The September index was 3 points above a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes, and farm wage rates for September was 165 percent of its 1977 base. This was unchanged from August but 3 points above a year earlier. Compared with August the feed and feeder livestock indexes were lower but the fuels and energy index was higher.

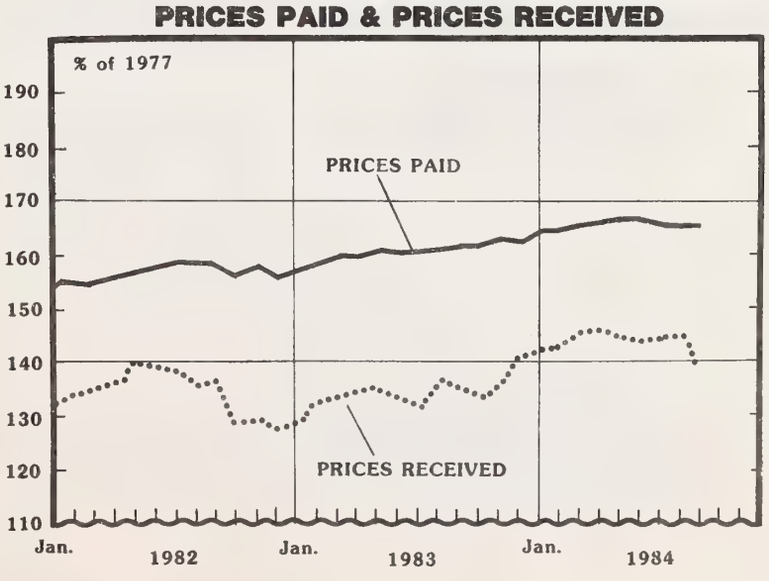
UNITED STATES INDEX NUMBERS OF PRICES PAID & PRICES RECEIVED



featuring..... BIG HORN COUNTY

Big Horn County was created in January of 1913 and occupies approximately 3,188,182 acres of land along the Montana/Wyoming border in south central Montana. The Crow Indian Reservation is almost entirely contained within the boundaries of Big Horn County, as well as half of the Northern Cheyenne Indian Reservation. Big Horn Lake makes up a section of the western border of the county, and the Big Horn River flows from the north end of the lake at the Yellowtail Dam. The river continues north, is joined by the Little Big Horn River in north central Big Horn County, and eventually empties into the yellowstone River just outside the county's northern boundary. The Rosebud Mountain range occupies a portion of the eastern half of the county, while the Big Horn Mountains lie in the southwestern corner.

Big Horn County was the second largest cattle raising county in the state in 1983, while it came in 12th for hog numbers in 1982 and 24th in the sheep inventory on January 1, 1983.

Major crops grown in the area include hay, winter wheat, and barley. The county ranked 8th 11th and 18th, respectively, for these crops in the 1983 crop production rankings. Big Horn county also came in 21st for durum wheat production, 25th for spring wheat, and 27th for oats.

The large number of cattle raised, along with the other livestock and livestock products, returned $32,412,000 to the county in 1982. Crop production contributed $25,641,000 and government payments added $2,027,00. This made for a total of $60,080,000 in all cash receipts for Big Horn County in 1982.

CATTLE ON FEED UP

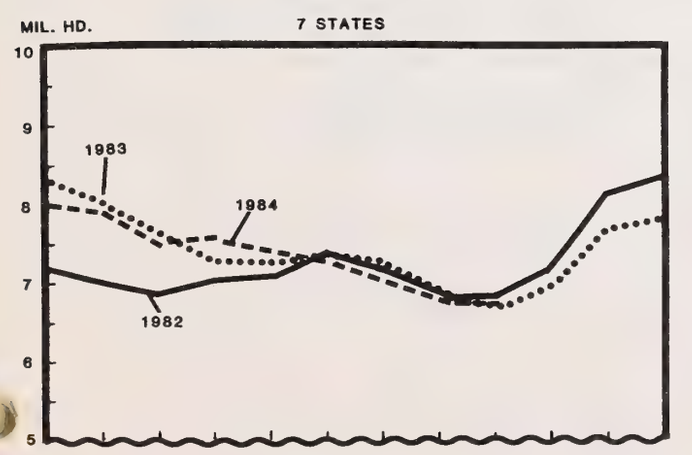
Cattle and calves on feed September 1 for slaughter market in the 7 states preparing monthly estimates totaled 6.75 million head, up 1 percent from a year ago but 1 percent less than September 1, 1982.

MARKETINGS of fed cattle during August totaled 1.67 million, 1 percent above last year but 1 percent less than August two years ago.

PLACEMENTS of cattle and calves on feed in the 7 states during August totaled 1.67 million, up 5 percent from last year but 4 percent less than the same month in 1982. NET PLACEMENTS of 1.60 million head during August were 7 percent more than last year but 4 percent less than two years ago.

OTHER DISAPPEARANCE totaled 61 thousand head compared with 88 thousand during August 1983 and 61 thousand during August 1982.

CATTLE ON FEED



CATTLE OUTLOOK

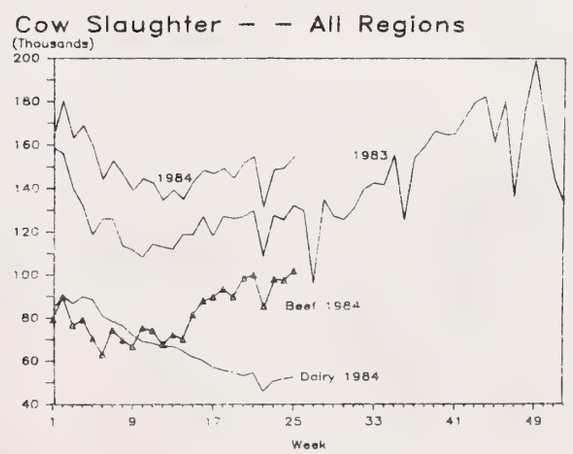
DAIRY COW SLAUGHTER DECLINES FROM FIRST QUARTER

Dairy cow slaughter remained above beef cow slaughter through the first week of March, accounting for 50-56 percent of federally inspected (FI) cow slaughter each week since January 1. Then, beginning in the second week of March, beef cow slaughter began to outpace dairy cow slaughter, and it retained this position for the rest of the first half. Total cow slaughter under Federal inspection for the first half was 4 million head--2.23 million beef cows and 1.77 million dairy cows. Most diversion program slaughter has taken place during the first half. The July 1 inventory showed a 2 percent decline in dairy cows. However, milk cow replacement heifers increased 1 percent from a year earlier, to 5 million head.

SECOND-HALF BEEF COW SLAUGHTER LIKELY TO DECLINE

For the second consecutive year, beef cow slaughter was high during January-June in the southern Great Plains. Because of tight forage supplies resulting from a continued drought this year, producers sent 29 percent more cows to slaughter than a year earlier. In 1983, cow slaughter was up 19 percent from the year before, also because of the drought.

(CONTINUED ON INSIDE PAGE)



(CONTINUED. . . .)

Cow slaughter in the Northern Plains was also large during first-half 1984, with the greater part being beef cows. Total FI cow slaughter was 744,700 head, including 186,500 dairy cows. This region is primarily comprised of mixed crop-livestock operations.

Because cow slaughter has remained heavy throughout the second quarter, it may not increase this fall as much as usual. Three factors support a forecast of declining cow slaughter:

--the herd will be well culled going into the fourth quarter;

--additional hay acreage is expected to be harvested, and forage conditions will probably be mostly good the rest of the year; and

--producers may begin to rebuild or at least stabilize the beef cow herd with the expectation of higher prices in 1985.

The average dressed weight of cows slaughtered in June was 490 pounds, 20 below last year and the lowest for June since 1978. This lower dressed weight indicates cows in poor condition, reflecting the severity of the drought in the Southwest and the late grazing season in many other areas because of the cool wet spring.

CATTLE HERD EXPANSION NOT LIKELY UNTIL 1986

After being in a holding pattern for the past three years, the cattle cycle is not likely to enter the expansion phase before 1986. Although a large percentage of heifers have calved and entered the herd over the past year, an even larger number of cows have been culled from the herd. The percentage of heifers retained might have been larger and might have indicated herd expansion if producers had not been constrained by financial problems or by lack of forage. In addition, the reported number of other heifers was large, suggesting that producers may have initially intended to hold a larger number of replacements to build their herds.

Given the likelihood that good forage conditions will continue in most regions and cattle prices will be higher this fall, the cattle industry may begin an expansion. A larger number of replacements may be held this fall, to be bred through mid-1985 and to calve in the fall and spring of 1985/86. These additional heifers would begin to show up on the January 1, 1986 inventory. Even larger numbers would calve and show up in the inventory of January 1, 1987.

(SOURCE: LIVESTOCK & POULTRY OUTLOOK and SITUATION, AUGUST 1984)

HOG INVENTORY DOWN

Inventory of all hogs and pigs on September 1, 1984, in the 10 states conducting quarterly hog surveys is estimated at 42.8 million head, 7 percent below last September 1 but 3 percent more than September 1, 1982.

--Breeding inventory, at 5.52 million head, was 5 percent less than a year ago, and 1 percent below two years earlier.

--Market hog inventory, at 37.3 million head, was 7 percent below last year, but 3 percent more than 1982.

PIG CROP: The June-August 1984 pig crop was 16.9 million head, 4 percent below last year but 4 percent above two years ago. There were 2.23 million sows that farrowed during June-August, a decrease of 7 percent from a year ago but 1 percent more than the same period two years ago. Sows farrowing during June-August 1984 averaged 7.60 pigs per litter compared with 7.36 last year and 7.39 during the comparable period two years ago.

FARROWING INTENTIONS: Hog producers in the 10 quarterly states intend to farrow 2.26 million sows during September-November of this year. This is 5 percent fewer than during the comparable period in 1983, and 4 percent fewer than two years ago.

Farrowing intentions for December 1984-February 1985 quarter are 1.91 million head, 1 percent below a year earlier and 9 percent below two years earlier.

RECENT SHIFTS IN U.S. EGG PRODUCTION

The commercial egg industry is changing locations. Substantial production gains that occurred in the South Atlantic and South Central regions in the late 1950s and early 1960s continued throughout the 1970s. But, output in these regions apparently peaked in 1980. Egg production in the South has begun to drop. On the other hand, certain States in the Mid-Atlantic and East North Central regions are showing increases.

Those States with low volume production have always experienced marked percentage changes in output. Now, however, the size of new egg production complexes means that one or two producers can cause significant changes in any State. In areas where output has dropped, much of the decline has been due to higher grain shipping costs. Producing areas where a large proportion of eggs are shipped long distances have also been vulnerable, since egg transportation costs have increased too.

Significant output increases have occurred in Indiana, Ohio and Pennsylvania--States located in or near both the grain belt and many of the Nation's population centers. Some of the newer operations have been financed by foreign investors. Modern egg-producing operations are highly mechanized, with very large capital investments. Once investors begin to expand, there often is momentum toward additional investments in those areas.

Egg production has always been relatively decentralized, and markets are very competitive. Thus, higher transportation costs for grain and eggs in recent years have provided greater incentive for self-sufficiency in some areas that did not have a comparative advantage in egg production. The Mountain States are such an area. Thus, there is also a trend toward greater output in areas more remote from large population centers.

Both these shifts in production--to grain belt areas near population centers, and to remote regions increasing their self-sufficiency--may lead to lower costs for consumers if the production complexes are as efficient as those in established areas.

The Mountain region's production declined for many years through the mid-1970s, but it has increased since then. Production climbed 8.5 percent from 1980 in 1983, to 1.9 billion eggs, only about 2.8 percent of U.S. output. Individual State's output is relatively small. However, Montana, Idaho and Colorado have seen substantial increases. Significant declines have occurred in New Mexico, with Wyoming and Arizona showing somewhat smaller drops. First-quarter changes for 1984 show similar patterns except for Colorado and Utah, which showed losses from a year earlier.

RED MEAT PRODUCTION DOWN

Montana slaughter plants produced 5.6 million pounds of red meat during August. The August production represented a 28 percent increase over last month but was 54 percent less than August 1983. Montana's total red meat production from January-August 1984 was down 65 percent from a year ago.

The August slaughter consisted of 7,900 cattle, 7,200 hogs, and 700 sheep. In terms of total liveweight, the cattle kill was down 19 percent from last year, and the hog kill was down 80 percent.

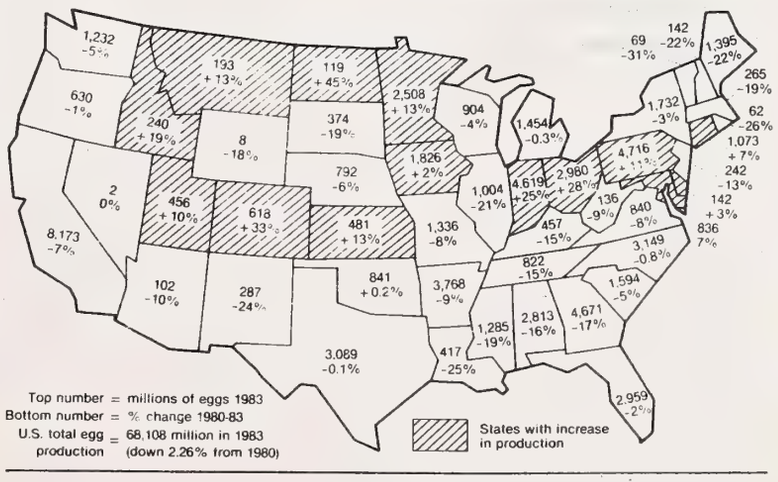
Nationally, commercial red meat production in August 1984 totaled 3.36 billion pounds, down 2 percent from August 1983. January-August red meat production, at 25.8 billion pounds, is up 2 percent from last year. The 1984 accumulated production percent changes by individual components were: Beef, up 4 percent; Veal, up 14 percent; Pork, unchanged; Lamb and Mutton, up 2 percent. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

MONTANA EGG PRODUCTION UP

Montana laying flocks produced 2 percent more eggs in the June 1-August 31 quarter compared with the same period last year. Production totaled 51 million eggs. The number of hens in the laying flock increased 1.7 percent and averaged 788 thousand for the quarter. The rate of lay was up slightly.

The Nation's laying flocks also produced more eggs than a year ago. In the June-August quarter egg production totaled 17.0 billion, 1 percent more than the same period in 1983. The number of layers averaged 276 million, 2 percent above a year earlier.

Egg Production by States for 1983 and Percentage Change in Production from 1980 to 1983



*featuring. . . . .*FERGUS COUNTY

Prior to 1925, Fergus County was known as the largest county in the United States. Judith Basin and Petroleum counties were created in 1920 and 1925, respectively, from portions of the area known as Fergus County. This still left Fergus County with a land area of approximately 2,714,880 acres. Today, 77 percent of those acres are occupied by farmland.

The entire northern border of the county is formed by a portion of the Missouri River. The land along the river is known as the Missouri Breaks. The Judith Mountains lie in the center of the county, while the Big Snowy and Little Snow Mountains lie along the southern boundary.

Fergus County is a major livestock producing area in the state. In the January 1, 1983 cattle inventory the county ranked 3rd, and came up 8th for the January 1 sheep inventory. The December 1, 1982 hog count showed Fergus County in 4th place for number of hogs.

In 1983 crop production, the county ranked 3rd in in the state for both oats and hay; 4th in barley production; 7th in winter wheat production; and 12th in all wheat production.

Cash Receipts for livestock in 1982 totaled $26,178,000, while crops contributed $25,759,000. Government payments added $3,826,000 for a total cash return of $55,763,000 and a rank of 10th among the counties.

HIGHLIGHTS:

CROP PRODUCTION FORECAST
PASTURE & RANGE CONDITION POOR
FARM PRICES
FOREIGN OWNERSHIP OF MONTANA AGRICULTURAL LAND

NATIONAL HIGHLIGHTS

Corn for grain production at 7.55 billion bushels is down 2 percent from the August 1 forecast but 81 percent above last year's drought-stricken crop. A crop of this size would be 8 percent below the record high crop of 1982.

Feed grain production (corn, sorghum, oats and barley combined) is expected to total 233 million metric tons, up 71 percent from 1983 but down 7 percent from 1982.

MONTANA WHEAT PRODUCTION DOWN SHARPLY

Montana's drouth stricken wheat harvest is expected to total 106.4 million bushels--22 percent less than last year. By contrast, the Nation's wheat harvest will reach 2.57 billion bushels, 6 percent above 1983.

Although Montana's total feed grain production is down 23 percent, the combined corn, sorghum, oats and barley production for the U.S. is up 71 percent from last year.

Because of a dry, cold spring and extended drouth, grain yields were the lowest in several years. This year's winter wheat yield is the lowest since 1980; durum and barley yields the lowest since 1961; hard spring wheat the lowest since 1967; oats the lowest since 1974; and sugarbeets the lowest since 1975.

MONTANA CROP PRODUCTION FORECAST--SEPTEMBER 1, 1984

PASTURE and RANGE CONDITION

Montana's pasture and range condition on September 1 at 54 percent of normal was 6 points under a month ago and 19 points below last year. This is the lowest condition figure since 1961 when the September 1 condition was only 53 percent of normal. The northeast and north central areas have the poorest conditions. The only areas in good condition are the western and extreme southern parts of the state.

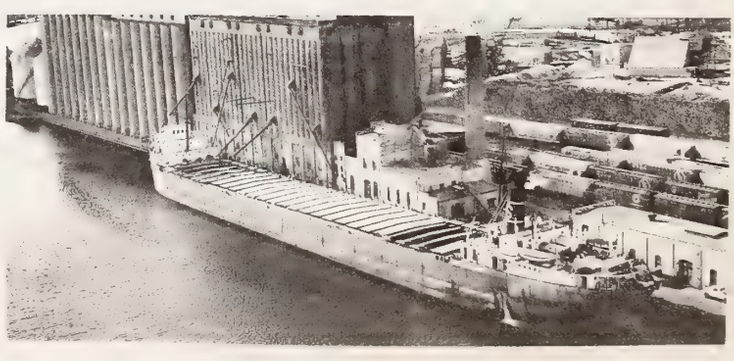
U.S. FARM EXPORTS STEADY

U.S. agricultural exports for fiscal 1984 are forecast at $38 billion, unchanged from the estimate made last May and 9 percent above the $34.8 billion for fiscal 1983. Export volume, however, is expected to drop 1 million tons from the May figure and total 141 million, 3 percent below the 144.8 million in fiscal 1983.

Agricultural imports are expected to reach $18 billion, up $500 million from the May estimate. Most of the increase comes from horticultural and tropical products, primarily coffee. This change will result in a positive agricultural trade balance of $20 billion, which is down $500 million from the May forecast.



FARM PRICES

The August index of prices received by Montana farmers and ranchers for all farm products at 151 was up 3 points from the revised July index. The all crops index at 159 was 5 points below July but 7 points above a year ago. The livestock and products index at 142 was 9 points above July and 11 points above August 1983.

In comparing August prices with July prices decreases or nor change were shown for all items except durum wheat, lambs, hogs, milk and eggs registered increases.

Nationally, the August all farm products index of prices received by farmers was unchanged from July at 144 percent of its January-December 1977 average. The index was 5 points above a year ago. Higher prices for oranges, lettuce, tomatoes, milk and tobacco were offset by lower prices for cattle, corn, soybeans, broilers and hogs.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for August was 165 percent of its 1977 base. This was unchanged from July but 4 points above a year earlier. Index increases from July to August of this year for family living items and feeder livestock were offset by decreases for feed and fuel.

USE OF MANUFACTURED INPUTS UP

With much of the former P.I.K. acreage returned to production, farmer's use of energy, agricultural chemicals, seed, machinery and equipment, and other manufactured inputs is up this year, compared with 1983. As of early June, field crop acreage was estimated at 284 million acres, almost 30 million acres more than 1983 plantings. However, a late, wet spring, continued high interest rates, and a record farm debt/asset ratio have kept fertilizer, pesticide, and farm machinery purchases lower than previously forecast for the 1984 crop year. Farmers now are expected to spend just under $41 billion on manufactured inputs in 1984, compared with about $37 billion in 1983.

- CATTLE ON FEED NUMBERS DECLINE
- RED MEAT PRODUCTION
- NATION'S WHEAT PRODUCTION
- '84 FARM LABOR
- NUMBER OF FARMS & LAND IN FARMS
- GRAIN MOVEMENT DECLINES
- CASH RECEIPTS FROM FARM MARKETINGS

CATTLE ON FEED IN 7 STATES DOWN 1 PERCENT

Cattle and calves on feed August 1 for slaughter market in the 7 States preparing monthly estimates totaled 6.81 million head, down 1 percent from a year ago and fractionally below August 1, 1982.

MARKETINGS of fed cattle during July totaled 1.55 million, 4 percent above last year and 5 percent more than July two years ago.

PLACEMENTS of cattle and calves on feed in the 7 States during July totaled 1.32 million, up 13 percent from last year and 10 percent above July 1982. NET PLACEMENTS of 1.24 million for July are 15 percent above last year and up 9 percent from two years ago.

OTHER DISAPPEARANCE totaled 84 thousand head, compared with 94 thousand during July 1983 and 68 thousand during July 1982.

JULY LIVESTOCK SLAUGHTER

Montana slaughter plants produced 4.4 million pounds of red meat during July--10 percent more than last month but 57 percent less than last year.

The July slaughter consisted of 6,900 cattle, 2,400 hogs, and 400 sheep. In terms of total liveweight, the cattle kill was down about 1 percent from last year and the hog kill was down 93 percent. Montana's total red meat production from January-July 1984 was down 66 percent from a year ago.

REGIONAL PATTERNS OF WHEAT PRODUCTION

This year the Plains States are expected to produce about 57 percent of the Nation's wheat crop--a slightly smaller percent than the last two years.

The Corn Belt States have about 16 percent of the total national production compared with 15 percent last year. This region has the largest percentage increase in wheat production for 1984.

The South, in 1984, will produce about 9 percent of the Nation's total wheat. Last year it was 8 percent, and the year before it was nearly 11 percent.

WHEAT and BARLEY MOVEMENT

Montana wheat shipped to out-of-state destinations in December 1983 through May 1984 was 11 percent below the same period last year. Wheat originating in central Montana shows the strongest decline, down 32 percent.

Barley shipments were 48 percent above last year reaching the highest level since records were started in 1974. Barley movement out-of-state has increased each year since 1977.

1/ A farm is a place as of June 1 that sells or could sell $1,000 of agricultural products during the year. 2/ Preliminary.

NUMBER OF HIRED WORKERS UP, WAGES HIGHER

During the week of July 8-14, 1984, 4.1 million people were working on farms and ranches in the United States. This includes workers hired directly by the farm operators and agricultural services employees working on farms. This is up 1.0 percent (.1 million) from the number for the corresponding week last year. Hired workers represented 43 percent (1.8 million) of the total. Of these workers, 1.44 million were hired directly by the farm operators which was 2.9 percent fewer than in July 1983. Farm operators and other unpaid workers who worked 15 hours or more accounted for the remaining 2.3 million workers, 1.9 percent above a year earlier.

The wage rate for all hired farm workers was $4.16 per hour, up 1.2 percent from July 1983. The wage rate for workers paid on an hourly basis was $4.12, up 4 cents from the previous year. Wage rates by categories of workers were: field $3.93, livestock $3.93, and piece-rate $4.60.

During the July 8-14 week, the self-employed farm operator averaged 48.2 hours, .6 hours less than in July a year ago. The unpaid workers on farms averaged 40.8 hours for the week, unchanged from July 1983 and hired workers averaged 36.8 hours, .3 hours more than last year.

Approximately 42 percent of the hired workers received perquisites, such as meals, housing or motor vehicle in addition to the cash wages in July 1984. About 13 percent of the hired workers were furnished a house in addition to the cash wages. In July 1983, 41 percent of the farm workers received some type of the perquisite. Data from the 1983 farm production expenditure survey showed that the value of perquisites represented 15 percent of the total farm and ranch labor expenditures.

MONTANA HARVEST PROGRESS
CROP PRODUCTION FORECAST
'84 WHEAT & BARLEY VARIETIES
PASTURE & RANGE CONDITION
JULY FARM PRICES

U.S. WHEAT FEED USE

U.S. wheat growers are hoping for another big surge in livestock feeding during June-September to moderate the expected gain in carryover stocks this season. Last season, about 390 million bushels of wheat were fed, of which 259 million were fed during June-September. Ample wheat supplies and tight feed grain stocks this summer should allow for feed use of around 375 million bushels, 15 million below last season. Feed use now accounts for about 15 percent of total use, up from less than 3 percent in 1980/81.

Because supplies are large relative to use, the farm price will probably average only slightly more than the 1984/85 loan rate of $3.30 a bushel. The target prices is $4.38 for this season, so wheat growers who participated in the acreage reduction program will likely earn another large deficiency payment.

CROP HARVEST PROGRESS

Hot, dry weather throughout the summer has hastened the maturity of Montana's grain crops. The winter wheat harvest was well ahead of schedule as of August 12th with 70 percent of the crop harvested. Normally, only 40 percent of the crop has been harvested by this time. The spring grain harvest began early as well with 30 percent of the barley, 25 percent of the spring wheat, and 20 percent of the oats harvested by the end of last week. The harvest is about 10 percent ahead of the normal pace for these crops. The second cutting of alfalfa hay was also well underway with 40 percent of the crop harvested compared with a normal of 30 percent.

MONTANA WHEAT PRODUCTION

LOWEST IN 11 YEARS

Montana's 1984 all wheat crop will be the smallest harvest since 1973. Based on August 1 conditions the forecast production is down 16% from last year. Winter wheat production is down 12 percent, hard spring down 21 percent, and durum down 17 percent.

With harvested acreage up 5 percent for all wheat the lower production is the result of sharply lower drought stricken yields. The winter wheat yield is expected to be 28 bushels per acre, the lowest since 1980, and down 1 bushel from the July 1 forecast and 7 bushels below last year. Hard spring wheat yield is forecast at 21 bushels per acre, the lowest since 1979. Durum yield is estimated to be 18 bushels per acre.

The State's barley production is only down 3 percent from last year's record, mainly because of a 20 percent increase in harvested acres. Barley yield, at 34 bushels per acre is the lowest since 1974. Oats production is about the same as last year. Hay production, is 1 percent under last year's reduced crop.

August 1 production forecasts are based on producer reports of condition and yield. Actual field observations and measurements are also used in making the wheat production forecast.

MONTANA WHEAT VARIETIES 1984

Redwin dominated the winter wheat varieties, as the number one choice of growers being planted on 933,500 acres. Winalta held second place with 361,000 acres while Norstar stayed in third place with 314,900 acres.

Newana remained the top spring wheat variety. Len also held onto its position as second while Fortuna replaced Olaf as the third favorite variety.

Vic captured the number one spot for durum wheat. Ward was second followed by Rolette and then Crosby.

MONTANA DAIRY PRODUCTS

Montana dairy plants produced 549,000 pounds of creamed cottage cheese in June--down 14 percent from last year.

Ice cream production totaled 185,000 gallons in June, 17 percent below the previous year.

American cheese output was down 2 percent at 432,000 pounds. Butter production at 79,000 pounds was 28 percent below last year.

MONTANA BARLEY VARIETIES 1984

Hector is still the most popular barley variety seeded in Montana in 1984. Hector, a feed barley, was planted on 32.4 percent of the barley acreage. Piroline remained at the number two position followed by Clark, both are malting type varieties.

Montana growers seeded 1,138,200 acres or 49 percent of their barley acres with malting varieties, up 8 percent over last year.

JULY FARM PRICES

The index of prices received by Montana farmers in July was down 2 points from June but remains 4 points above last year. The crops index dropped 8 points from June as the harvest season approached Montana. At the same time the livestock index moved up 3 points.

Looking at individual prices--all crop items fell off with winter wheat leading the decline, 25 cents lower than June. Livestock prices were all up with hogs leading the advance $4.40 per cwt higher. Steers and heifers and cows were up 60 cents, calves up 10 cents. Eggs were down 4 cents and wool was unchanged. Compared with last year nearly all items were higher. The exceptions were winter and durum wheat down 9 and 5 respectively. Eggs were down 3 cents.

PER CAPITA FOOD CONSUMPTION

CATTLE and CALF INVENTORY DOWN

The Nation's cattle herd on July 1, 1984 is estimated at 122 million head, 1 percent less than last year and 2 percent below July 1, 1982. This year's reduction marks the third consecutive year in which the cattle inventory has moved downward.

The 1984 calf crop is expected to be down 2 percent from the 1983 crop. Calves on hand July 1, counted as part of the inventory, were down 1 percent.

Steers weighing 500 pounds or over were down 3 percent from last year, and beef type heifers being kept for breeding were also down 3 percent. However, other beef heifers were up 2 percent. Heifers being kept for milk cow replacements were up 1 percent. Milk cows were down 2 percent and beef cows were down 1 percent from last year. Individual state estimates are not available until January 1.

CATTLE ON FEED DOWN

Cattle and calves on feed July 1, 1984 for slaughter market in the 13 quarterly states totaled 8.70 million head, 4 percent below last year and 3 percent less than two years ago.

The cattle on feed inventory included 5.64 million steers and steer calves, down fractionally from a year ago but virtually unchanged from 1982. This group represented 65 percent of the total July 1 number on feed compared with 62 percent in 1983. Heifers and heifer calves accounted for 3.03 million, down 10 percent from last year and 8 percent below 1982.

Placements of cattle and calves on feed during the April-June quarter totaled 5.57 million, 5 percent below the same quarter one year ago, and 4 percent below the comparable period in 1982. Other disappearance of 582 thousand head leaves net placements at 4.99 million.

Marketings of fed cattle for slaughter during April-June totaled 5.63 million, up 2 percent from the same quarter last year, and 8 percent above the same quarter in 1982.

LIVESTOCK SLAUGHTER

Commercial red meat production for the United States in June 1984 totaled 3.20 billion pounds, down 3 percent from June 1983. January-June red meat production, at 19.4 billion pounds, is up 3 percent from last year. The 1984 accumualted production percent changes by individual components were: beef, up 4 percent; veal, up 13 percent; pork, up 2 percent; lamb and mutton, up 5 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

Kill days for June 1984 included 21 weekdays and 5 Saturdays.

MONTANA RED MEAT PRODUCTION

Montana slaughter plants produced 4.0 million pounds of red meat during June--just one percent less than last month but 67 percent less than last year.

The June slaughter consisted of 6,600 cattle, 2,300 hogs, and 200 sheep. In terms of total live weight, the cattle kill was down 24 percent from last year and the hog kill was 94 percent less than last year. For the first half of 1984, Montana's total red meat production was down 68 percent from a year ago.

THE HOG FARMER GETS 90 CENTS FOR A POUND OF PORK CHOPS COSTING $1.99 IN THE BUTCHER SHOP.

MILK PRODUCTION

Montana milk production in the second quarter of 1984 showed a seasonal increase over the first quarter but was below last year. Estimated output in the April-June period was 90 million pounds compared with 85 million in January-March.

Last year the April-June output totaled 92 million pounds. The number of milk cows was unchanged from last year.

United States milk production during June totaled 11.8 billion pounds (5.37 million metric tons), 4 percent below June 1983.

Accumulated milk production during the second quarter of 1984 totaled 35.8 billion pounds (16.2 million metric tons), 3 percent below the comparable period in 1983.

Production per cow averaged 1,091 pounds during June, 13 pounds below June 1983.

The total number of milk cows averaged 10.8 million head during June, 3 thousand less than the May average.

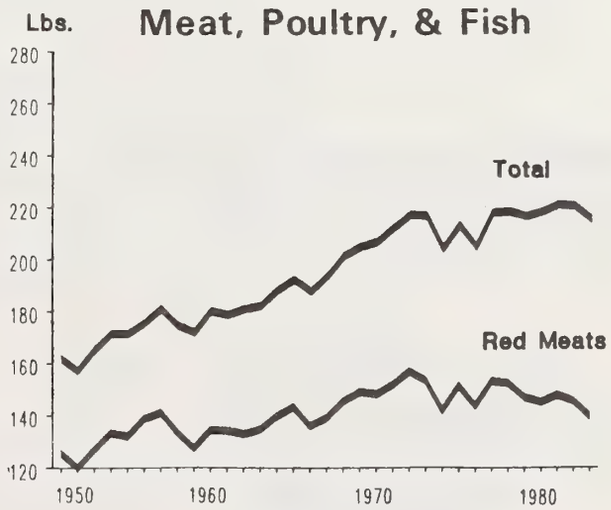
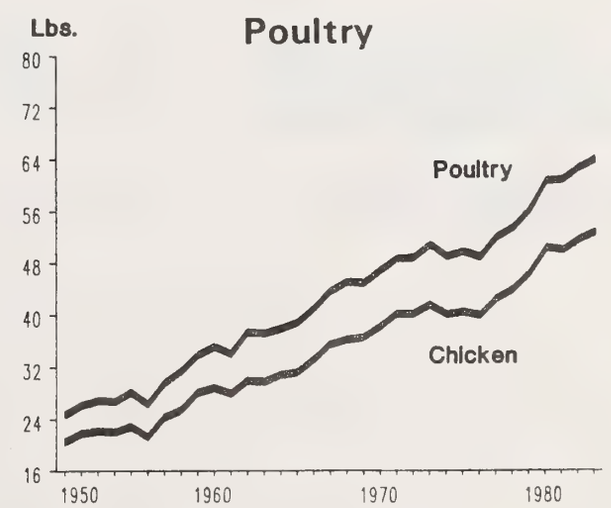
THE DAIRY FARMER GETS 58 CENTS FOR A HALF-GALLON OF MILK COSTING $1.12 AT THE GROCERY STORE.

U.S. PER CAPITA CONSUMPTION

Total consumption of meat, poultry, and fish has increased 33 percent since 1950--from an average of 162 pounds to nearly 216 pounds in 1982. Most of this growth occurred prior to 1970, when consumption began to level off.

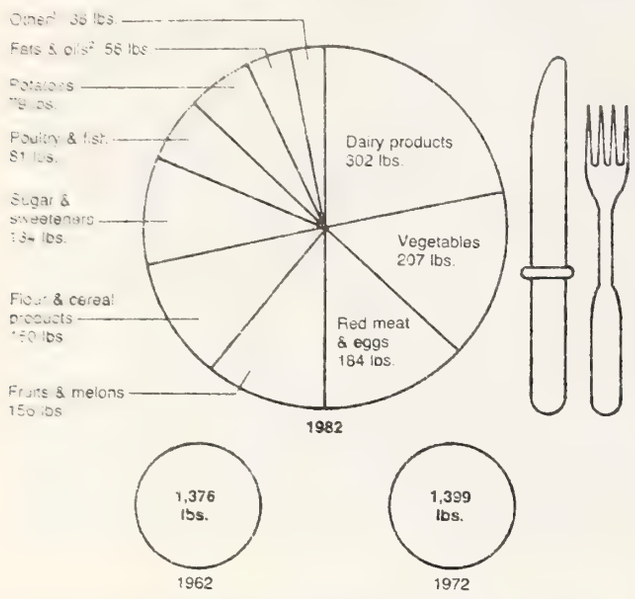
Although total consumption of meat, poultry, and fish has varied no more than 6 pounds per capita since 1970, the mix has changed. For example, we ate about 63 pounds of chicken and turkey each year in 1980-82, compared to only about 50 pounds during the first 3 years of the of the 1970's. Beef and veal consumption fell from 86.4 pounds to 78.6 pounds per person during the decade. Pork consumption changed little--dipping from an average of 64.5 pounds in 1970-72 to 64.1 pounds in 1980-82. Fish consumption began climbing, though slowly, in the 1970's. By 1982, it totaled 12.3 pounds per person, compared to 11.8 pounds in 1970.





America's Menu

Americans Consumed an Average of 1,387 Pounds of Food Per Capita in 1982[1]



[1]Includes game meat and home-grown fruits and vegetables. [2]Does not include "invisible" fats consumed in meats, milk, and other products. [3]Lentils, nuts, coffee, tea, spices, etc.

THE FARMER GETS 93 CENTS FOR A POUND OF BEEF STEAK SELLING AT THE MEAT COUNTER FOR $1.59.

MONTANA CROP ACRES

Montana farmers planted more acres to hard red spring wheat and barley than last year. This is the second year in a row that barley acreage increased substantially from the previous year and reflects options under the farm program as well as dry seeding conditions this spring.

Montana crop acreage highlights include: total wheat acreage for harvest at 4.8 million acres--up 8 percent from 1983. By classes--winter wheat is forecast at 2.5 million acres, up 10 percent; hard red spring for harvest at 2.1 million, up 6 percent; durum at 200,000 is down 2 percent.

Barley acreage for harvest is forecast at a record high 2.2 million acres, up 20 percent from 1983. Acres of oats for harvest as grain at 140,000 are up 17 percent. All hay acres for harvest at 2.3 million are up 6 percent.

NATIONAL CROP ACRES

The nation's planted crop acres rebounded from last year's depressed level, with feed grains showing the strongest comeback. Feed grains are 17 percent above last year while food grains are up 5 percent. Oilseed crops are up 12 percent.

U.S. HIGHLIGHTS

Corn plantings up 33 percent from last year, when planted acreage was the lowest since records began. Acres harvested for grain up 39 percent.

Sorghum plantings up 38 percent, harvested for grain acres up 49 percent.

Oats plantings down 40 percent from 1983, harvested acres for grain down 11 percent.

Barley plantings up 15 percent, harvested for grain up 17 percent.

All Wheat plantings up 4 percent, harvested for grain up 8 percent.

JULY CROP PRODUCTION FORECAST

Montana's winter wheat crop for 1984 is forecast at 71.9 million bushels. Acreage for harvest is up nearly 10 percent from last year but producers expect to harvest 9 percent fewer bushels. Yield prospects were lowered during June because of below normal rainfall in much of the important winter wheat area of north central Montana. The July 1 forecast of winter wheat yield at 29 bushels per acre compares with 35 bushels last year and 38 bushels 2 years ago.

Montana barley production for 1984 is expected to reach 88.8 million bushels, up 14 percent from last year.

Oats production forecast at 5.7 million bushels is nearly 9 percent more than last year, mainly due to a 17 percent increase in acres for harvest.

The state's sweet cherry crop is forecast at 2,100 tons, up 17 percent from last year.

The first production forecast for hard red spring wheat, durum, corn, dry beans, sugarbeets and hay will be released August 10.

MINK

Mink pelt production in the United States in 1983 totaled 4.11 million pelts. Wisconsin, the major mink state, produced 1.17 million pelts.

By color class, the number of pelts as a percent of the total U.S. production was: Standard - 32.4 percent; Demi-Buff - 17.2 percent; Ranch Wild - 10.5 percent; Pastel - 12.1 percent; Pearl - 8.0 percent; and Violet - 6.0 percent. The remaining color classes accounted for 13.8 percent.

Mink pelts sold during the 1983 crop year were valued at 120.1 million dollars. The average price per pelt for the 1983 crop year was $29.20, compared with an average price of $28.90 in 1982 and $32.20 in 1981.

There were 1,067 mink farms producing pelts in 1983. Leading states were Wisconsin with 252 farms, Minnesota with 148 farms and Utah with 145. Fox were raised on 14 percent of the mink farms.

JUNE FARM PRICES

The June index of prices received by Montana farmers was down 3 points from May but was still 3 points above one year ago.

The June index at 150 (1977=100) dropped from May to June because most important items in the index fell off. Only durum wheat, barley, calves, sheep and lambs showed increases. Spring wheat, hay and wool were unchanged.

Compared with last year, winter wheat is the only crop item showing a lower price. In the livestock category, cattle, calves and sheep were down from last year.

PASTURE & RANGE CONDITION DOWN

Montana's pasture and range condition on July 1 was 72 percent of normal, down 5 points (6 percent) from a year ago. Pastures improved in the northeast part of the state because of June rains, but deteriorated in the north central. Pastures and ranges remain in good to excellent condition in the southern and western areas.

MAJOR WHEAT IMPORTERS

Projected 1984/85 world wheat demand has changed only slightly from the initial estimate of a month ago. The estimate of European Community (EC) wheat imports has been cut to 3.5 million tons, the lowest level since the EC's formation. Estimates of imports of high-protein hard and durum wheats for blending, which come primarily from the United States and Canada, have been reduced by half a million tons for both 1983/84 and 1984/85. Shipments in 1983/84 lag well behind prior years as EC millers have apparently adapted to using more domestic milling wheat in their mill mix.

On the other hand, deteriorating crop prospects in the North African area, particularly in Morocco, along with a general up trend in consumption, is expected to result in some additional wheat imports. Adverse weather in the Middle East continues to plague wheat crops with imports expected to again be heavy, particularly for Iraq and Syria. India, with prospects for a record or near-record wheat crop, is still expected to import very little wheat in 1984/85, compared with the levels of the past 3 years. Commitments under various grain trading agreements are still expected to result in some increase in Chinese wheat imports from the 1983/84 level. A smaller 1984 USSR wheat crop is likely to keep them in the world market for significant quantities of wheat again this year. Korea's wheat imports are expected to continue at the 1983/84 high level as significant purchases of wheat for feed are likely to continue.

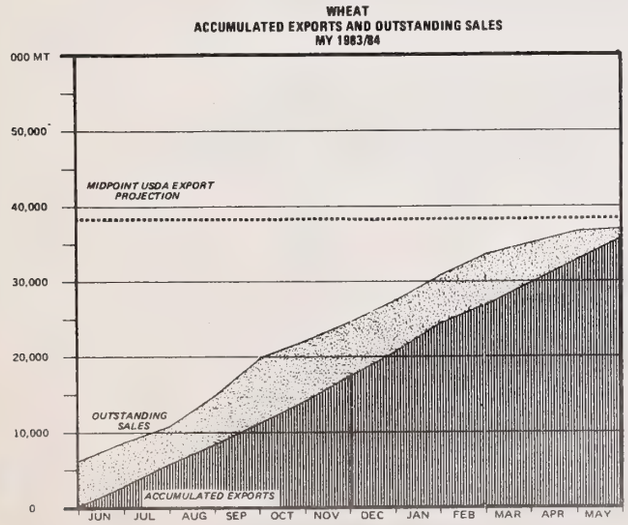
FARM INCOME PROSPECTS MIXED

The outlook for farm income is mixed. Net farm income in 1984 is forecast to rise to $30 to $34 billion, with much of the gain due to the expected buildup in farm inventories. On the other hand, net cash income is forecast between $34 and $38 billion, down from last year. Gross cash income will rise, reflecting higher receipts from crops and livestock. Direct Government payments will remain large, mainly because a sizable portion of the 1983 PIK payments were dispersed this year. But gains in receipts will be offset by rising production expenses, as more acres are seeded this year and as input prices again rise in line with the general inflation rate.



MONTANA WHEAT STOCKS DOWN

Wheat stored in Montana on June 1, 1984 was down 20 percent from the same date last year. However, with 90.5 million bushels on hand, the supply exceeds the 4 years prior to 1983, and is the third largest carry-in ever recorded. Winter wheat stocks were down 2 percent and spring wheat was down 34 percent. About 80 percent of the wheat stocks are stored on the farm, and 20 percent in off-farm locations.

Barley stocks were 40 percent below last year's relatively high June 1 holdings. Stocks totaled 11.9 million bushels with 10.1 located on the farm and 1.8 off-farm. Oats stocks were down 39 percent from a year ago. Except for 1981, this is the smallest carryover in the past 20 years.

Old Crop Wheat stored in all positions in the United States on June 1, 1984 totaled 1.39 billion bushels, down 8 percent from the 1.52 billion bushels on hand June 1 a year ago, but 20 percent more than two years ago. Farm stocks amounted to 592 million bushels, down 12 percent from June 1, 1983. Off-farm stocks, at 803 million bushels were down 5 percent from June 1 a year earlier. Indicated disappearance during April-May totaled 362 million bushels. For the comparable period last year, disappearance was 347 million bushels. Old crop durum wheat stocks in all positions June 1, 1984 totaled 101 million bushels, 25 percent less than last year`s 136 million bushels, but down 4 percent from June 1, 1982.

Old crop barley stored in all positions on June 1, 1984 totaled 189 million bushels, down 13 percent from June 1 a year ago. Indicated disappearance during April and May 1984 was 79.6 million bushels (1.73 million metric tons), 3 percent more than the corresponding period a year earlier. Old crop oats in all storage positions on June 1, 1984 totaled 181 million bushels, down 18 percent from June 1 a year ago.

EGG PRODUCTION INCREASES

Montana's laying flock increased seasonally from the first quarter to the second quarter. The average number of laying hens and pullets on hand in the second quarter, ending May 31, was 765,000. This was 4 percent below the same quarter last year. Egg production, however, was up 2 percent with 49 million eggs produced during March-May 1984.

The nation's laying flocks produced 17.2 billion eggs during the March-May 1984 quarter, 1 percent fewer than the 17.3 billion produced during the corresponding quarter a year ago. The total number of layers for the quarter averaged 277 million, 1 percent above 275 million a year earlier.

RED MEAT PRODUCTION

Montana slaughter plants produced 4.0 million pounds of red meat in May 1984--33 percent more than April but 57 percent less than May last year.

May slaughter consisted of 6,300 cattle, 2,400 hogs, and 300 sheep. Cattle kill was below last year and hog kill continues at less than 10 percent of the previous year.

Commercial red meat production for the United States in May 1984 totaled 3.41 billion pounds (1.55 million metric tons), up 8 percent from May 1983. January-May red meat production, at 16.1 billion pounds (7.32 million metric tons), was up 5 percent from last year. The 1984 accumulated production percent changes by individual components were: Beef, up 5 percent; veal, up 14 percent; pork, up 4 percent; lamb and mutton, up 7 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

U.S. HOG INVENTORY DOWN 9 PERCENT

Inventory of all hogs and pigs in the U.S. on June 1, 1984, is estimated at 52.0 million head. This is 9 percent below a year ago but about the same as 1982.

The breeding herd, at 7.34 million head, was 9 percent less than a year ago and 1 percent below two years ago.

The market hog inventory, at 44.7 million head, was 9 percent below a year ago but about the same as two years ago.

The December 1983-May 1984 U.S. pig crop was 41.5 million head, an 11 percent decrease from the corresponding period last year but 1 percent above two years ago. Sows farrowing during this 6-month period, at 5.56 million, were 11 percent less than the comparable period last year. Pigs saved per litter was 7.46 compared with 7.52 last year and 7.34 two years ago.

U.S. producers intend to have 5.61 million sows farrow during the June-November period, a decrease of 9 percent from the same period in 1983 and 3 percent below 1982.

featuring. . . . . CARTER COUNTY

Carter County is situated in the extreme southeastern corner of the state, bordered on the east by South Dakota and to the south by Wyoming. The landscape is characterized largely by rolling prairie with the exception of some territory in the northwest and north central area of the county that is occupied by sections of the Custer National Forest. The Little Missouri River meanders through the southeastern corner of the county.

In 1982, Carter County was the number one sheep raising county in the state. In number of cattle for 1982, the county was in 18th place. Some hogs are also raised as Carter County stood 31st in the December 1, 1981 hog inventory.

Principal crops raised include oats, hay and wheat. In the 1982 crop production figures the county stood in 12th, 16th and 31st place respectively for these crops.

Livestock returned $21,703,000 in cash receipts to the county in 1982, while crops added $11,320,000. Government payments amounted to $974,000 for a total return of $33,997,000 in 1982 cash receipts.

WINTER WHEAT FORECAST DOWN

Montana's 1984 winter wheat crop is forecast at 74.4 million bushels, 6 percent smaller than last year's crop and 4 percent below the May 1 forecast. If realized this would be the smallest crop since 1980. June 1 conditions indicate a yield of 30 bushels per acre compared with 35 last year. Precipitation during May was below normal in many major winter wheat areas causing poor growing conditions.

The nation's winter wheat crop is forecast to be 1 percent smaller than last year. The Plains states, with nearly 51 percent of the U.S. production, are down 9 percent. A 7 percent increase in acreage did not offset the large reduction in yields forecast for these states. Production in the three Pacific Northwest states is up 3 percent and the Corn Belt states are up 5 percent. The Southern states accounting for about 11 percent of the U.S. production are up the most with a 7 percent increase.

PASTURE & RANGE CONDITION

Pastures and ranges in the southern tier of counties and most of the western third of the state were green and growing. Elsewhere range grasses have not greened up and are not growing well because of dry weather and cool temperatures. The grasses in many areas are heading on short stems, because of the poor growing conditions, drastically limiting production.

About 70 percent of the cattle and sheep had been moved to summer ranges by the end of May. There has been some culling of older stock and some producers have started shipping stock to other areas for summer grazing.

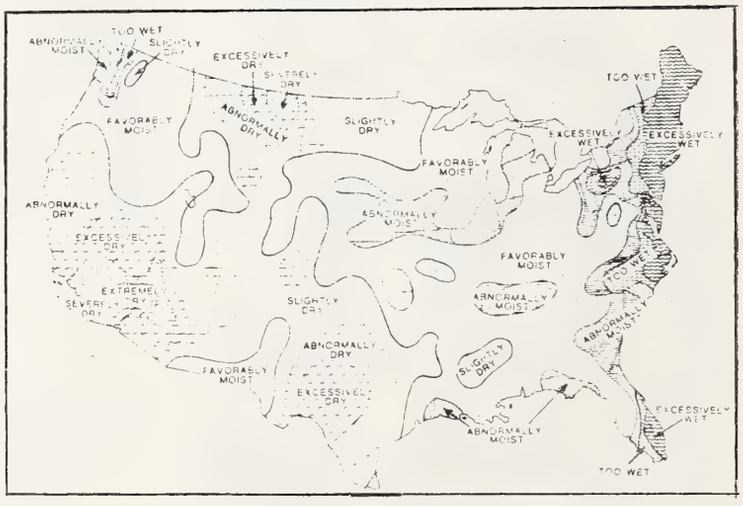
CROP MOISTURE -- -- JUNE 2, 1984



HOW MUCH U.S. AGRICULTURAL LAND IS OWNED BY FOREIGN INVESTORS?

According to USDA's latest tally as of December 31, 1983, 13.7 million acres are owned by nearly 8,500 foreign investors from more than 80 nations. These investors reported some holdings of forestland, pasture, cropland or other U.S. agricultural land. The 1983 figure is 279,000 acres higher than the 1982 total. For the nation as a whole, foreign investors hold just a tad more than 1 percent of all privately owned ag land.

FARM PRICES

The mid-May index of prices received by Montana farmers dropped 1 point below both the previous month and the same month last year. The May index at 153 (1977=100) reflected a 5 point drop from the previous month in the livestock index and a 2 point increase in the crops index. Every item in the livestock index was down but every item in the crops index moved up from last month.

The U.S. May all farm products index of prices received by farmers decreased 2 points from April to 144 percent of its January-December 1977 average. Lower prices for eggs, cattle, onions, tomatoes and milk were partially offset by higher prices for oranges, soybeans, and cotton. The index was 7 points above a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for may was 166 percent of its 1977 base. Replacement livestock prices were lower, while fuel, fertilizer, agricultural chemicals and family living items were higher. Compared with a year earlier, the index was up 5 points.

CHERRY PRODUCTION

Based on June 1 conditions Montana's cherry crop is forecast at 2,100 tons, 17 percent above last year. Pollination was below average because cold weather limited bee activity. Winter damage was localized and not too severe. Average date of bloom was May 15, somewhat later than normal.

Sweet cherry production in the six western states is expected to total 152,700 tons, 3 percent less than last year.

featuring. . . . . HILL COUNTY

Hill County is located along the Montana/Canadian border midway between the east and west borders of the state. The county is traversed by the Milk River which empties into the Fresno Reservoir at the Fresno Dam near the center of the county. At the tip of the Fresno Reservoir the Milk River turns north, continuing through Hill County and on into Canada. A major portion of the Rocky Boy Indian Reservation is located in the southeastern corner of the county. A portion of the Bear Paw Mountains occupy the southeastern corner as well.

The main industry in the county is farming as Hill County is one of the major grain growing areas in the state. In the 1982 crop production figures, the county ranked 2nd in all wheat and winter wheat, and 1st in spring wheat production. Also in 1982 Hill County came in 6th for both barley and oats production.

Hill County is also a major hog raising area as it came in 4th in the December 1, 1981 hog inventory. Some sheep and cattle are also raised in the area.

The abundant grain crops grown in the county brought in $59,973,000 in cash receipts in 1982. Livestock receipts came to $6,237,000, with government payments adding $6,945,000 for a total cash receipt return of $73,155,000 in 1982.

FARM MACHINERY SITUATION
featuring.....LINCOLN COUNTY

FARM EXPENDITURES

U.S. farmers are expected to spend $42 billion on machinery and equipment, agricultural chemicals, and energy this year, up 13 percent from 1983. Expenditures for farm machinery inputs are estimated at $13.9 billion, one-third of the total, and will be about 11 percent greater than last year. Outlays for other inputs probably will increase at rates ranging from 9 percent for fuel and lubricating oil to 23 percent for seed. Contributing to this outlook are a projected $9- to $16- billion rise in net farm income and a prospective return to production of 30 to 35 million PIK-diverted acres.

Farm machinery purchases, leases, and rentals may rise 9 percent in 1984 to $8.6 billion. Repairs and operating expenditures are expected to climb 15 percent to $5.3 billion, primarily due to the anticipated gain in planted acreage. Unit sales of farm machinery are projected to rise 5 to 8 percent, although combine sales could decline by 10 to 15 percent.

Pesticide use will expand significantly in 1984 as U.S. field crop acreage rises. Farmers will use around 440 million pounds, active ingredient, of herbicides, 67 million pounds of insecticides, and 7 million pounds of fungicides this season. Pesticide supplies are sufficient to meet expected demand in the major crop regions, although spot shortages of some newly marketed formulations have been reported in the Corn Belt. On average, farmers will pay about 7 percent less for herbicides and 5 percent less for insecticides than in 1983.

Total fertilizer use on field crops is expected to climb 17 percent in 1984, despite an overall rise in fertilizer prices. Farmers will apply an estimated 10.7 million tons of potash this season. Average farm prices are likely to show a year-to-year gain of 16 percent for nitrogen, 8 percent for phosphorus, and 5 percent for potash. Domestic production and imports of the three plant nutrients should meet anticipated demand.

Agricultural energy demand is projected to rise 10 percent in 1984 as fuel needs expand with the anticipated increase in field crop acreage. Farm energy expenditures likely will rise to $8.4 billion from $7.7 billion in 1983. Farmers can expect average per-gallon prices to hold constant this year at about $1.18 for gasoline, $1.04 for diesel fuel, and $0.77 for LP gas.

Farm expenditures for selected production items, 1977 to 1983 and forecast 1984

[1]Includes leasing and rental. [2]Estimated. [3]Forecast.

FARM MACHINERY

SUPPLIES--There have been unusually large supplies of most types of farm machinery for the past few years for several reasons. Imports of machinery assembled abroad have increased significantly. At the same time, sales were declining, and manufacturers did not adjust domestic production rapidly enough to avoid inventory accumulation.

This is perhaps best illustrated by the tractor supply situation for 1982 and 1983. In 1982, U.S. tractor supplies included 246,200 units of which 122,200 or 50 percent were inventories carried over from the previous year, 59,500 units or 24 percent which were domestically produced during the year, and 64,500 units or 26 percent that were imported. Tractor supplies in 1983 were about 5 percent less than in 1982, with about the same share in inventories (47 percent) but with domestic production declining from 59,500 units to 32,400, a 46-percent drop. Most of the drop was in the 40-99 hp category which declined from 15,000 units to fewer than 500. By contrast, the number of imported units increased from 64,500 to 90,700, a 41 percent rise.

The inability to make timely downward production adjustments has resulted in inventories of tractors and selected types of harvesting machinery that are currently about double normal inventory requirements.

INVENTORIES--Tractor inventories increased between 1978 and 1981-82. Yearend stocks were about the same for 40-99 hp tractors and about twice as great for larger 2-wheel drive tractors in 1983 as in the early and mid-70's. However, inventories for 40-99 hp tractors have been declining in the last few years because of major factory production cutbacks, reflecting reduced demand for these tractors.

POTATO STOCKS DOWN

On May 1, 1984 there were 50,000 cwt of potatoes in Montana storages compared with 200,000 cwt on May 1, 1983.

Potato stocks in the 15 major producing states totaled 46.2 million cwt, down 19 percent from last year and 9 percent below 1982. The May 1 stocks accounted for 17 percent of fall production this year compared with 19 percent last year.

RECOVERY BROADENS

World economic output will likely grow 3.5 to 4.0 percent in 1984. The industrialized economies, including the United States, will enjoy the largest expansion. As in 1983, growth in the United States, forecast at 5 to 6 percent, will probably be much faster than that in the other industrialized countries, especially in Europe. Although growth in the centrally planned economies and the less developed countries as a group will likely trail the average rate for the world, their expansion will probably exceed the rate of expansion last year, especially for the LDC's.

World trade volume this year is apt to climb about 3.5 percent, following almost no growth in 1983. This increase will boost export earnings for all regions, but it will especially help the LDC's that export manufactured goods and industrial raw materials. Thus, Asian countries that produce manufactured items will probably see a surge in sales and revenues, and so could some African nations that export mostly raw materials. Exporters of petroleum, however, will probably grow much less than the world average rate, because of continuing slack demand.

INVESTMENTS, CONSUMPTION STRONG IN FOREIGN INDUSTRIAL COUNTRIES

For the foreign industrialized countries, the recovery will be supported by exports, investments, and consumption. Japan, Canada, and to a lesser extent the U.K. and Germany have enjoyed the strongest rebounds and will likely remain the leaders this year. Some of the increases in their exports will reflect sales to the United States, where healthy growth and the high-valued dollar are expected to continue fueling import demand. Japan and Canada together provide about 40 percent of U.S. imports, so they will benefit proportionately more from the U.S. expansion.

Annual Percent Changes in Growth Rates for World Economies

CROP-WEATHER SUMMARY
FOR WEEK ENDING MAY 19, 1984

Soil moisture continued short except in the south central and western portions of the state. While rain was reported in north central and northeastern Montana, high winds in these areas reduced the benefit of this moisture. Most activities centered on windup of small grain plantings, summerfallowing, weed spraying and moving livestock to summer pastures.

Calving and lambing were virtually complete by week's end and about 50 percent of the livestock had been moved to summer ranges. Hay and range growth were progressing slower than normal due to the cool spring weather.

1/ For period 1951-1980.

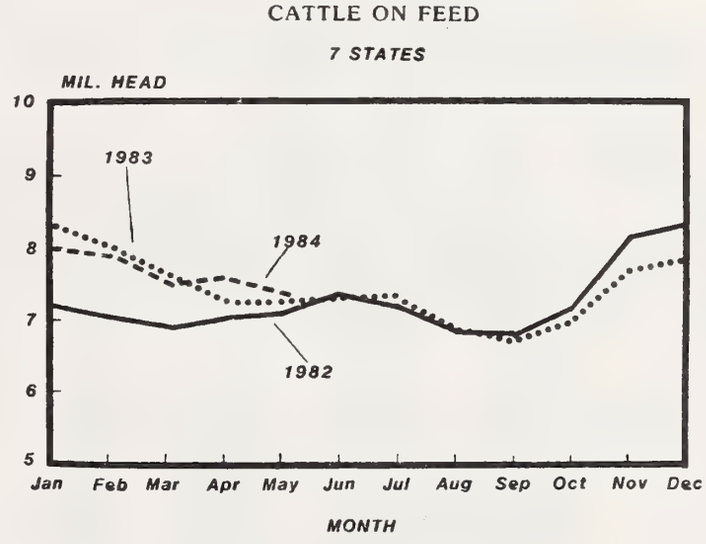
CATTLE ON FEED IN 7 STATES UP

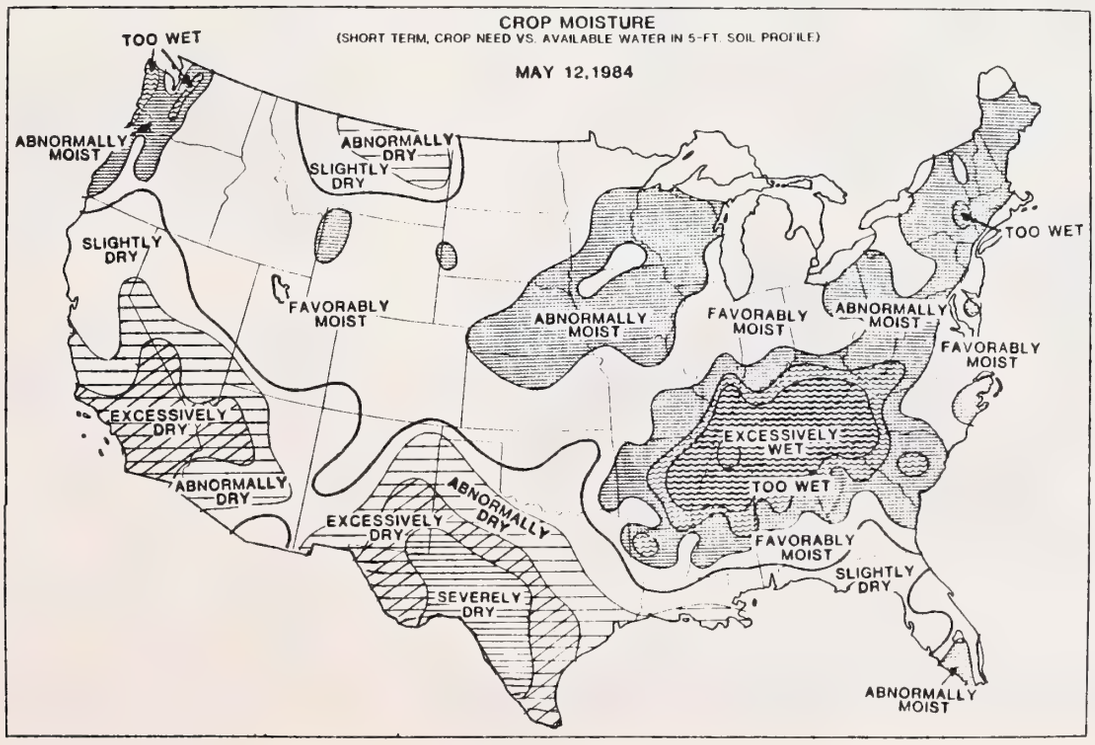
Cattle and calves on feed May 1 for the slaughter market in the 7 states preparing monthly estimates totaled 7.38 million head, up 2 percent from a year ago and 4 percent more than May 1, 1982.

MARKETINGS of fed cattle during April totaled 1.52 million, a 4 percent increase from last year and 8 percent above April two years ago.

PLACEMENTS of cattle and calves on feed in the 7 states during April totaled 1.52 million, 3 percent below both last year and 1982. NET PLACEMENTS of 1.33 million for April are down 6 percent from last year and 9 percent from 1982.

OTHER DISAPPEARANCE totaled 184 thousand compared with 143 thousand during April 1983 and 109 thousand two years ago.





featuring. . . . . LINCOLN COUNTY

Lincoln County is nestled among the mountains in the extreme northwestern corner of the state. Created in July of 1909, the county covers approximately 2,346,240 acres. Lumbering is the chief industry in the county. The agricultural areas are limited, the only considerable body of open land being found in the Tobacco Plains valley, near Eureka. The Kootenai River traverses the county from west to east. The Libby Dam on the Kootenai River near the center of the county, forms Lake Koocanusa which extends up into Canada. The Yaak River runs through the northwestern corner of the county and joins the Kootenai River near the Montana/Idaho border.

That land in farms occupies only 55,391 acres of the total 2.3 million acres in the county illustrates the limited agricultural interest. Lincoln County ranked 51st in all hay production, 54th in oats, and 56th for barley in the 1982 crop production figures. No wheat was grown in the county in 1982.

In the livestock inventories, Lincoln County ranked 37th in hog numbers, on December 1, 1981; 45th in sheep, and 54th in cattle numbers on January 1, 1982.

1982 cash receipts for the county totaled $2,601,000. Livestock receipts made up $1,438,000, crops contributed $1,147,000 and government payments made up the remainder of the total with $16,000.

STATE	79,100	81,840	+ 3

DOLLAR'S GAIN IS EXPORT'S LOSS

The U.S. dollar's strength against foreign currencies since 1980 has had the same effect as an export tax--it has raised the world market price of American products and reduced the demand for U.S. exports.

As the dollar dropped in value during the 1970's, U.S. farm exports boomed, and idled acreage was shifted into crop production. Then, as the dollar climbed in value in the early 1980's, the boom ended. U.S. farm exports slumped and government stocks of surplus production grew. It is estimated that the U.S. lost a total of about $3 billion in export sales of wheat, corn and soybeans during 1981 and 1982 because of the strengthening dollar. In volume, the loss amounted to 16 million tons.

MAY 1 CROP REPORT

The Nation's winter wheat crop, forecast at 1.98 billion bushels will be only 1 percent less than last year. Acreage is up 8 percent, and the expected yield at 38.2 bushels is down 3.6 bushels from a year ago.

For Montana, production is expected to total 81.8 million bushels, 3 percent more than last year. The state's acreage is up almost 10 percent while the yield prospects are down 2 bushels from last year.

PASTURE & RANGE

Montana's overall pasture and range condition on May 1 was unchanged from last month at 74%. This is 11 points below last year. Condition varies from extreme drought in the northeast corner to excellent in the central, southwest and extreme northwest areas. Part of the north central area is rated very poor. Rains and snow the latter part of April helped ranges in much of the state but largely missed the northeast section. At the beginning of May about 10 percent of cattle and sheep had been turned out to summer pasture.

Includes value of milk fed to calves.

FARM PRICES UP FROM A YEAR AGO

Montana farmers and ranchers received higher prices for most of the products they sold in April compared with a year ago. The items showing lower prices this year, compared with a year ago were winter wheat, steers and heifers, calves and hogs. From March to April this year, prices softened for many major items while increases were noted for spring wheat, barley, oats, alfalfa hay, hogs, eggs and wool.

The mid-April index of prices received for all Montana farm products at 158 (1977=100) was unchanged from last month but up 2 points from last year. The April all crops index at 155 compared with 154 in March and 149 in April last year. The livestock and products index at 160 is the same as March, but 4 points under a year ago. Helping most to hold the indexes steady with a month earlier were stronger prices for wool, alfalfa hay, spring wheat and hogs.

MANUFACTURED DAIRY PRODUCTS

Montana dairy plants produced 197,000 gallons of ice cream in March, 46 percent more than February and 14 percent above the March 1983 total. Creamed cottage cheese production was 561,000 gallons--8 percent above February and 7 percent above a year ago.

SIXTEEN PERCENT SPENT FOR FOOD

In 1983, Americans spent slightly less than 16 percent of total personal disposable income on food, the lowest percentage on record. This share compares with 16.2 percent 10 years ago, and 18.7 percent 20 years ago. These percentages differed among income groups. Low-income pesons spent proportionally more on food and higher-income consumers spent proportionately less.

*featuring. . . . .*LIBERTY COUNTY

Contained within 920,960 acres, Liberty county is one of the smallest counties in the state. It lies in north central Montana with its northern boundary stretching to the Canadian border. The land is mostly flat with the exception of low elevation hills that lie in the northwestern section of the county. The Marias River traverses the county from west to east, flowing out of Lake Elwell at the Tiber Dam in southern Liberty county and eventually running into the Missouri River in central Montana.

Although small in size, Liberty County is an important wheat growing area in Montana. In the 1982 crop production, Liberty County ranked 6th in winter wheat production, 8th in spring wheat, and 13th in durum wheat. The county also showed up in 11th place for barley production in 1982. Some oats and hay are also grown.

Hog raising is another important industry in Liberty County as it came in 10th in the December 1, 1981 hog numbers. Some sheep and cattle are also raised.

Liberty County's abundant crops brought in $41,072,000 in cash receipts in 1982. Livestock receipts turned in $3,526,000, while government payments added 4,075,000 for a total cash receipt return of $48,673,000 in 1982.

MONTANA WHEAT STOCKS DOWN

Wheat stored on Montana farms and in mills and elevators April 1, 1984 totaled 119.8 million bushels, down 15 percent from the record high 140.6 million last year. Wheat disappearance since January 1 was 41.2 million bushels, compared with 60.1 million bushels during the same period a year ago. Farm storage, at 97.2 million bushels was 16 percent below last year and commercial storage accounted for 22.6 million bushels, down 10 percent. Farm storages accounted for 81 percent of the total wheat stored in Montana.

Winter wheat stocks, at 64.9 million bushels were 12 percent above the April 1, 1983 stocks. All spring wheat, at 54.9 million bushels was down 34 percent from last year. The durum portion at 10.7 million bushels was 29 percent below last year.

Barley stocks in all positions at 23.8 million bushels were 28 percent below last year. Oats in storage at 3.4 million bushels was down 24 percent from last year.

NATIONAL WHEAT STOCKS LOWER

Naticnally, all wheat stored in all positions on April 1, 1984 totaled 1.75 billion bushels, 7 percent less than last year's record high 1.88 billion bushels. Farm stocks amounted to 772 million bushels, off 13 percent from a year ago. Off-farm stocks, at 981 million bushels were down 1 percent from April 1. Indicated disappearance during January-March 1984 totaled 574 million bushels. In the comparable period a year earlier, disappearance was 644 million bushels.

Durum wheat stored in all positions on April 1, 1984 amounted to 125 million bushels, down 24 percent from 1983's record high 164 million bushels, and 6 percent less than April 1, 1982. Farm stocks of 89.3 million bushels are 31 percent below the 130 million bushels on hand April 1, 1983. Off-farm stocks, at 35.2 million bushels, are up 4 percent from April 1 a year ago.

Barley stored in all positions on April 1, 1984 totaled 273 million bushels, 8 percent less than last year's 297 million bushels. Stocks of barley stored on farms amounted to 174 million bushels, or 64 percent of the total stocks. Off-farm storages held 99.7 million bushels, or 36 percent of the total stocks. On-farm stocks were down 12 percent but off-farm stocks were up 2 percent from April 1, 1983.

1984 WHEAT PROGRAM SIGN-UP REOPENED UNTIL MAY 4

Producers with a 1984 wheat base have until May 4 to sign up or revise their sign-up in this year's wheat program. This announcement was issued by the State ASCS office on April 20, 1984.

MILK PRODUCTION UNCHANGED

Montana dairymen produced 85 million pounds of milk during the January-March quarter, unchanged from a year ago, but 2 percent less than the October-December 1983 quarter.

Nationally, milk production during the first quarter of 1984 totaled 34.1 billion pounds, fractionally below the comparable period in 1983.

POTATO STOCKS DOWN

Montana potatoes in storage on April 1 totaled 1.05 million cwt, 14 percent less than on the same date last year. Stocks were 58 percent of the 1983 production.

In the 15 major fall producing states, there were 77.4 million cwt in storage, down 13 percent from a year ago and 5 percent below two years ago. April 1 stocks accounted for 28 percent of fall production this year compared with 30 percent last April 1.

MONTANA RED MEAT PRODUCTION DOWN

Commercial red meat production in Montana amounted to 2.2 million pounds in March 1984, 35 percent less than the previous month and only 20 percent of the March 1983 total. The number of cattle slaughtered was 3,100 compared with 7,000 in March 1983. The March 1984 hog kill amounted to 2,400 compared with 39,200 the same month last year.

Commercial red meat production for the U.S. totaled 3.35 billion pounds in March 1984, up 2 percent from a year ago.

CHICKEN and EGG RECEIPTS UP

Montana poultry producers received $188,000 for chickens sold in 1983, 4 percent more than in 1982. This is the fourth year receipts have been above the previous year. Receipts for eggs sold were also higher at $8.7 million compared with $8.5 million in 1982. However, egg receipts in recent years have been stable, showing both year to year increases and decreases.

featuring. . . . . ROSEBUD COUNTY

Rosebud County was created in February of 1901 and is located in the southeastern corner of Montana. The Yellowstone River runs through the heart of the county. It is made up primarily of rangeland, both to the north and south of the River. However, the extreme southeastern corner is occupied by a portion of the Custer National Forest. The Northern Cheyenne Indian Reservation also occupies a portion of the southern tip of Rosebud County.

Because of its vast rangeland, the county is a prime livestock raising area. The county ranked 7th and 8th respectively in sheep and cattle numbers in the January 1, 1982 livestock count. Hogs and pigs are also raised, as the county showed up in 25th place in the December 1981 hog count.

Crops produced in the county include wheat, barley, oats and hay. Rosebud County ranked 21st in barley production, 28th in all wheat, 29th for all hay and 37th in oats production for the 1982 crop year.

Cash receipts from livestock amounted to $15,868,000 or 54% of the total cash receipt return. Crops turned in $12,257,000, and government payments added $1,274,000 for a total cash receipt return of $29,399,000 in 1982.

U.S. WOOL SITUATION

In 1983, the U.S. wool textile business completed the best year of the decade. Industry sources believe that strong mill orders should continue into 1984. However, mill demand will slacken if economic growth slows in late 1984.

Mill consumption of raw wool in the fourth quarter was 37 million pounds, clean, which was the largest fourth-quarter since 1972. Apparel wool was 34.5 million pounds, 41 percent more than last year. Raw wool use in carpets was 2.5 million pounds, 16 percent above a year earlier.

Compiled from reports of the Bureau of the Census.

MONTANA WOOL PRODUCTION INCREASES

Montana wool growers produced 5.6 million pounds of wool in 1983, 2 percent more than last year. But, inspite of the increased output, the market value was 13 percent less than the 1982 clip. The average price per pound was 67 cents for 1983, a 12 cent crop from the previous year. The average price received by growers in all states was 61.3 cents. The average fleece weight for the U.S was less than 8 pounds. Montana growers averaged 10.2 per fleece for 1983 wool. So Montana growers had a slight edge over the national average in price and fleece weight.

In terms of total wool production, Montana ranks number 7. Texas, Wyoming, California, Colorado, South Dakota and Utah (ranked in order) all out ranked Montana.

LIVESTOCK CASH RECEIPTS DOWN

Montana livestock producers marketed 1.2 billion pounds of meat animals in 1983 and grossed $583.3 million. Compared with last year, marketings were down nearly 2 percent and cash receipts fell 1 percent.

Cattle and calves accounted for 93 percent of cash receipts, hogs were 4 percent; sheep and lambs 3 percent.

For the nation, livestock marketing volume was down about 1 percent and cash receipts were down 5 percent from last year.

MANUFACTURED DAIRY OUTPUT

Montana dairy plants produced 135,000 gallons of ice cream during February--22 percent more than the same month a year ago. Production of creamed cottage cheese at 521,000 pounds was 7 percent above a year ago, but 7 percent below the previous month. Butter production at 175,000 pounds was the same as February 1983.

1983 estimates of wheat acreage, yield and production by county are now available. If interested, request a copy from our office.

PASTURE and RANGE

Montana pasture and range condition as of April 1 is reported at 74 percent of normal, this is 15 points below last year at this date. The low condition reflects very dry conditions in northeast Montana. Several counties in that region report less than 50 percent of normal. This condition is partly a carryover from the drought that developed late last summer and fall.

A large region including western, central and part of south central Montana reports good to excellent conditions (80 percent or over).

featuring..... GALLATIN COUNTY

Gallatin County is located on the headwaters of the Missouri River in southern Montana, at the northwest corner of Yellowstone National Park. Between one-third and one-half of the county is contained within the Gallatin National Forest. Created in February of 1865 and covering 1,610,880 acres of land Gallatin County is a prime agricultural area. The county seat is Bozeman and this area has an annual average precipitation of 18.63 inches.

Cash receipts from the sale of livestock and livestock products turned in $24,040,000 for Gallatin County in 1982. Crops returned $28,204,000, and government payments added $1,454,000. Total cash receipts for the county in 1982 amounted to $53,698,000.

Being one of the larger cattle raising areas, Gallatin County ranked 14th in the January 1, 1982 cattle inventory. The county was in 17th place in the 1982 sheep inventory, and 22nd in the 1981 hog count.

Major crops raised in the area include hay, barley and wheat. Gallatin County was in 4th place in the county rankings for 1982 all hay production, 9th in barley production, and 24th in all wheat production for 1982.

MONTANA SHEEP & LAMB LOSS OVER 4 MILLION DOLLARS

Montana sheepmen lost 120,000 head of sheep and lambs in 1983 to predators, disease, weather and other death dealing causes. The value of the loss came to $4.6 million. Of the total number lost, predators killed 29 percent, non-predator factors contributed 61 percent, and 10 percent was due to unknown causes. Lamb losses made up 75 percent of the total.

WEATHER LOSS TOPS ALL OTHERS

Bad weather claimed 27 percent of the total number of sheep and lambs lost in 1983--the number one killer. Coyote predation was second with 20 percent. A year ago, coyote loss was number 1, followed by weather related losses. Other significant losses in 1983 were due to lambing complications--11 percent; disease--9 percent; old age--4 percent; fox, eagle, poison and on back each with 3 percent; dog--2 percent; bear and theft each with 1 percent; and other non-predator loss with 3 percent. The 'other'category was mainly due to sheep and lambs getting bogged down near water holes in the eastern part of the state. Unknown losses accounted for 10 percent of the total.

COOPERATION

This study was undertaken at the request of the Montana Wool Growers Association who also provided funding. The Montana Crop and Livestock Reporting Service conducted the survey and expresses appreciation to all cooperating sheep producers.

HOG INVENTORY DOWN

Inventory of all hogs and pigs on March 1, 1984, in the 10 States conducting quarterly hog surveys, is estimated at 39.5 million head, 5 percent below last March. This is 3 percent below March of 1982 and the lowest March inventory since 1976.

--Breeding inventory, at 5.35 million head, was 10 percent less than a year ago and 4 percent less than March 1982. This is the lowest March breeding herd inventory since 1973 when estimates for these comparable 10 States became available.

--Market hog inventory, at 34.2 million head, was 5 percent below last year and 2 percent below two years ago.

PIG CROP

The December 1983-February 1984 pig crop was 13.5 million head, 13 percent less than last year and 4 percent below two years ago. There were 1.86 million sows that farrowed during the quarter, a decrease of 11 percent from a year ago and 6 percent below the same period two years ago.

Sow farrowings averaged 7.26 pigs per litter compared with 7.44 last year and 7.11 two years ago.

FARROWING INTENTIONS

Hog producers in the 10 quarterly States intend to farrow 2.48 million sows during March-May of this year. This is 11 percent less than actual farrowings during the comparable period in 1983, but 4 percent more than two years ago. Farrowing intentions for June-August are 2.10 million head, 13 percent below the same period last year and 5 percent less than two years ago. If these intentions are realized, this will be the lowest June-August farrowings since 1975.

LIVESTOCK FEED INDICATORS CHANGING

Feed use of corn will have to drop below year-earlier disappearance during the latter part of this year. Aggregate livestock and poultry numbers will show little change from a year earlier until June-September. But the outlook is beginning to change even for then. Returns to cattle feeders improved during the fall; consequently, placements on feed in the seven monthly reporting States rose 13 percent in December and 5 percent in January. If feed grain prices remain where they have been the past couple of months, placements on feed the first quarter may exceed year-earlier placements by more than the 2.7 percent built into the current forecast. This would modify the projected drop in livestock feeding during June-September. Similarly, hog producers may have modified breeding plans, so farrowings in the late spring and early summer may not be down as much as anticipated earlier. This too would alter the decline in feed use expected during June-September.

The current outlook is for free corn stocks to become very tight by spring. Through the spring and summer, the market will need to pull corn out of reserve V. The extent of the price increase will depend on the amount of corn on hand April 1, the outcome of the harvest in the Southern Hemisphere, and the extent to which short-run supply reacts to these factors.

CHICKEN NUMBERS DOWN

The average number of layers on hand in Montana during the quarter December through February was estimated at 738,000, 5 percent less than a year ago. However, egg production from December through February was up 4 percent with 48 million eggs produced. Nationally, the average number of layers was down 3 percent at 277.2 million birds. Egg production for the quarter was down 3 percent as well with 16.8 billion eggs produced.

FEBRUARY LIVESTOCK SLAUGHTER

Montana's slaughter plants produced 3.4 million pounds of red meat during February, 26 percent less than in January and 69 percent less than a year ago. February cattle slaughter was 5,400 head while hog slaughter was 2,100 head.

Commercial red meat production for the United States during February totaled 3.09 billion pounds, up 11 percent from February 1983.

Beef production at 1.86 billion pounds was up 9 percent from last year, and head kill at 2.97 million was up 10 percent. Veal production at 36 million pounds increased 13 percent from a year ago. Calf slaughter of 255 thousand head was up 14 percent. Pork production totaled 1.17 billion pounds--up 14 percent as was the head killed at 6.81 million head. Lamb and mutton production was 32 million pounds, an increase of 19 percent. The monthly head kill of 56,300 was up 20 percent.

*featuring. . . . .*VALLEY COUNTY

Valley County was created in 1893. Located in northeastern Montana, it stretches from the Canadian border on the north to its southern boundary along the Missouri River and Fort Peck lake. The Milk River traverses the county diagonally. With a total of 3,183,360 acres, it is one of the largest counties in the state in area. A good portion of the eastern half of the county is occupied by part of the Fort Peck Indian Reservation. Glasgow is the county seat and this area has an average annual precipitation of 11.55 inches.

Valley County is a major wheat growing area as it ranked 3rd in all wheat and spring wheat production in the 1982 crop production totals. Also in 1982, the county came up 8th in both oats and all hay production, and placed 13th among the counties for barley production.

Livestock raising is also a major agricultural enterprise in the county. It showed up in 12th place in the January 1, 1982 cattle inventory, and ranked 13th in the December 1, 1981 hog count.

The county's crops turned in $33,018,000 in 1982 cash receipts while its livestock returned $15,049,000. Government payments added $5,692,000 for a total cash receipt return of $53,759,000 in 1982.

MONTANA CASH RECEIPTS DOWN

Preliminary cash receipts data indicate Montana farmers and ranchers have taken in 7 percent less from the sale of commodities in 1983 than the previous year. Livestock receipts are up about 3 percent, but crops receipts show a 13 percent decrease.

CASH RECEIPTS -- MONTANA

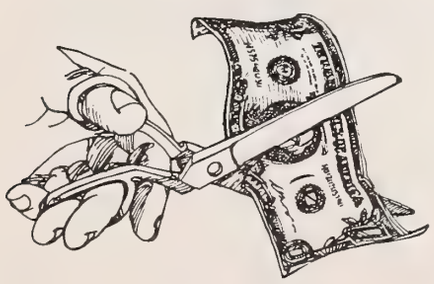
1/ Revised. 2/ Preliminary. 3/ Excludes Government Payments.



AGRICULTURAL OUTLOOK

Because of improvement in the economy, demand for farm products will probably pick up in 1984, especially for red meat and restaurant food. Although foreign demand for farm goods is also expected to increase, it will still be constrained by the sluggish and uneven recovery abroad, the high value of the dollar, and large supplies of some commodities overseas. Somewhat higher inflation and interest rates will mean a slight acceleration in farm costs. Real interest rates will stay high, so farmers with relatively little debt will continue to fare better than highly leveraged producers.

The new dairy legislation, which will pay farmers for milk production cutbacks, may reduce 1984 output by 2 to 10 percent. It probably will also prompt producers to cull their herds, raising beef output, especially in the first half of the year. Total meat production in the first half may be up 2 percent from a year earlier. Moderate increases are likely for beef and pork, but broilers may be down 2 percent.

Increased imports will partially offset the fruit and vegetable losses that resulted from last December's cold spell. Additional frozen concentrated orange juice will come from Brazil to help make up for the 17 percent drop in U.S. citrus production. Mexico will ship the U.S. extra vegetables this winter, particularly since a decline in the peso's value has made Mexican imports cheaper.

Worldwide, the recovery is going less rapidly. A quarter-by-quarter comparison shows that, for the major foreign industrialized economies, the current rebound is less vigorous than that which followed the 1975 recession. Import and export volumes, as well as industrial production, have lagged behind the pace of the mid-1970's recovery.

The EC summit meeting held in Athens in December failed to untangle any of the knotty agricultural problems confronting the Community. Most revolve around money; the EC faces a financial crisis. How the various issues are resolved will affect U.S. agricultural exports, since the EC is both our biggest farm export customer and one of our major competitors in the world market.

FARM EXPORTS DOWN IN 1983

U.S. agricultural export values fell in calendar year 1983 to $36.1 billion. Volume also fell 3 percent to 148 million tons. Over the past 2 years, worldwide import demand for and export supply of agricultural products, particularly U.S. products, have undergone substantial adjustments. High global producer prices encouraged greater production, which in turn, combined with a debilitating recession, lowered import demand. Since 1981, when U.S. export values peaked at $43.3 billion, export quantity has fallen 9 percent, mainly reflecting adjustments by importers; prices have fallen about 8 percent, primarily reflecting adjustments by exporters.

1/ Not adjusted for transshipments.

WEATHER-CROP UPDATE

Topsoil moisture is generally adequate except for some areas in the north central and eastern portions of the state. There is some concern over adequate irrigation water supplies for the coming year due to the below normal snowpack in most areas of the state.

Winter wheat was in generally good condition over the state at mid-March but still dormant in most areas. Although snowcover protection has been poor, wind damage has been light.

Livestock are reported in good condition. The mild weather during February and the first of March eased feeding requirements and provided good calving and lambing conditions. Both calving and lambing were over 30 percent complete by mid-March. Hay and feed supplies are generally adequate. However, some local shortages of hay were being reported.

LIVESTOCK PRICES IMPROVE

Prices received by Montana farmers in January for grains were lower than the previous month, but livestock prices during the same period went up. Compared with a year earlier, prices in January for winter wheat and most livestock items were lower, while spring wheat, durum, barley, hay, lambs and hog prices were higher.

The mid-January index of prices received by Montana farmers for all farm products was 144 (1977=100)--3 percent above December 1982, and 1 percent under January 1983. The all crops index at 149 was 2 points under a month ago, but 5 points above last year. The livestock and products index at 139 was 9 points above December but 6 points under last year.

POTATO STOCKS DOWN

Montana producers had 1.55 million cwt of potatoes in storage on March 1, 1984--6 percent less than a year ago. The stocks represent 86 percent of production.

In the fifteen major fall states there were 108 million cwt in storage. This is down 11 percent from last year and 3 percent below two years ago. The March 1 stocks accounted for 39 percent of fall production in the fifteen states compared with 41 percent a year ago.

featuring..... WHEATLAND COUNTY

Wheatland County lies in central Montana. The Little Belt Mountains mark its northern boundary, and the lower levels of the Crazy Mountains spill over into a small portion of the southwest corner. The Musselshell River runs east and west through the middle of the county. The land is generally level, sloping gently toward the Musselshell River. Harlowton is the county seat. This area has an annual average precipitation of 12.75 inches, and an average of 104 frost free days.

In the agricultural picture, Wheatland County shows up as one of the major sheep and hog producers. The county ranked 5th in 1982 sheep numbers, and 6th in 1981 hog inventory; while it came in 34th in the 1982 cattle inventory.

Winter and spring wheat are grown in the area with rankings of 26th and 36th respectively in the 1982 crop production figures. Also in 1982, Wheatland County ranked 30th in barley production, and 32nd in oats.

Wheatland County's total cash receipt figure for 1982 was $13,446,000. Livestock and livestock products contributed $9,295,000 of that total, while crops brought in $3,463,000. Government payments added the final $688,000.

PLANTING INTENTIONS FOR 1984

Many Montana farmers and ranchers participated in a U.S.D.A. survey to determine their intentions to plant major crops for harvest in 1984. The information shown below is the result of this survey.

SPRING PLANTING INTENTIONS

Montana farmers and ranchers expect to plant 22 percent more hard red spring wheat this spring than last year. Their intentions indicate 2.5 million acres will be seeded. This is up strongly from last year's reduced plantings but still the smallest acreage since 1978. Durum plantings are expected to be up 90,000 acres following last year's reduction of 140,000 acres. Last fall wheat growers planted 2.7 million acres of winter wheat, a 6 percent increase over one year ago. Total wheat plantings, using winter wheat seeded and growers intentions for spring wheat add up to 5.5 million acres. This is 14 percent above last year, but still the smallest all wheat acreage since 1978.

Barley plantings are expected to be down 15 percent as growers choose spring wheat over barley for 1984. Acreage devoted to oats will be up 10 percent according to growers intentions on February 1. This is still a small acreage compared with earlier years. Improved dry bean prices prompted growers to consider planting twice as much this spring compared with 1983. The 1984 plantings are expected to be 6,000 acres. Corn planting is expected to rebound from last year's low 65,000 acres to 90,000 in 1984. Sugarbeet intended plantings are unchanged from last year. Montana farmers and ranchers expect to harvest 6 percent more hay acreage in 1984 than last year.

POTATO STOCKS DOWN

On February 1, 1984 there were 1,650,000 cwt of potatoes in Montana storages--6 percent less than last year.

For the 15 major fall potato producing states there were 134,655,000 cwt in storage, a 10 percent decrease from last year. Idaho storages held 13 percent less than last year, Oregon was down 15 percent, but Washington was up 1 percent. The total 1983 crop in the 15 states was 6 percent smaller than the previous year.

JANUARY LIVESTOCK SLAUGHTER

Montana's slaughter plants produced 4.6 million pounds of red meat during January, 3 percent less than December 1983. January cattle slaughter was 8,000 and hog slaughter totaled 2,400 head.

Commercial red meat production in the United States during January totaled 3.22 billion pounds, up 2 percent from January 1983.

Beef production at 1.91 billion pounds was down 1 percent, but total head killed at 3.11 million was up 1 percent. Veal production was 39 million pounds, an increase of 15 percent. Calf slaughter at 277,000 head was up 14 percent. Pork production totaled 1.23 billion pounds--up 6 percent and the hog kill totaled 7.19 million head, an increase of 8 percent. Lamb and mutton production was 31 million pounds, an increase of 3 percent. The monthly head kill of 553,000 was up 6 percent.

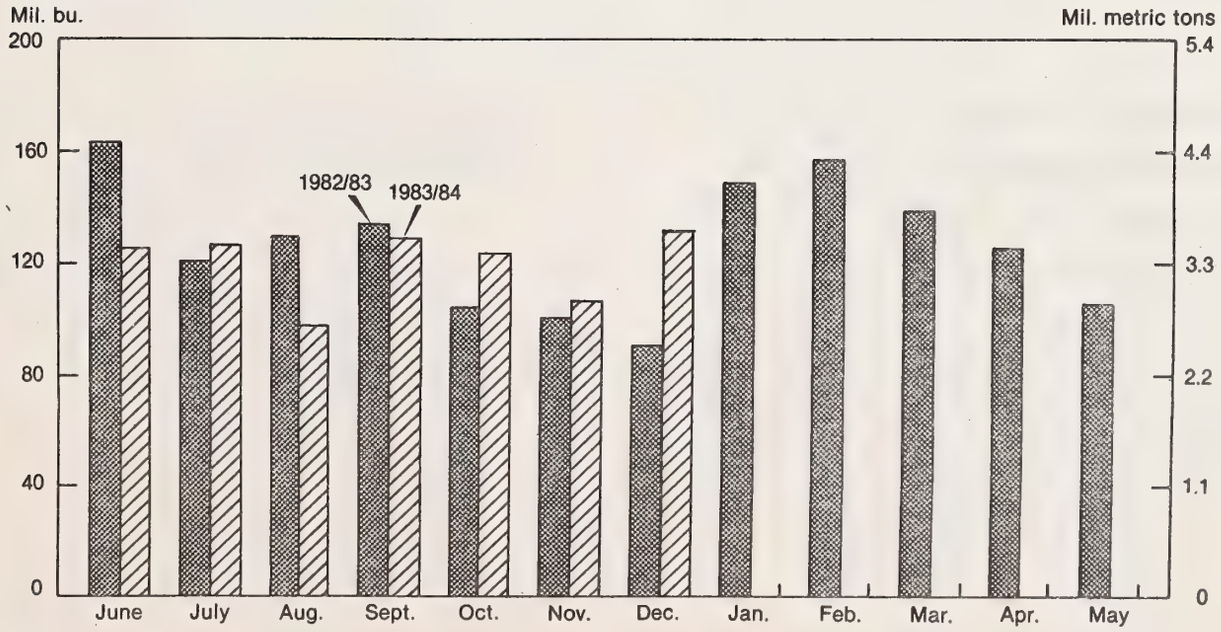
THE NATION'S MIDSEASON WHEAT STOCKS DECLINE, DOMESTIC DISAPPEARANCE EXPANDS

January 1 wheat stocks totaled 2.32 billion bushels, an 8 percent drop from a year earlier. The influence of 1983's reduced harvest and robust use during June-December caused the first year-to-year decline in January stocks since January 1979. Lower stocks of bread wheats (Hard Red Winter and Hard Red Spring) contributed the major part of the reduction--they fell 10 percent. Meanwhile, stocks of pastry wheats (Soft Red and White) remained high--12 percent more than a year ago. The Durum-crop shortfall in 1983 caused January stocks to be 30 percent lower.

January wheat stocks in the farmer-owned reserve fell 300 million bushels from a year earlier because of PIK entitlements. Thus, the percentage of readily marketable wheat (free stocks) for the remainder of the 1983/84 season is much higher than a year ago, which partly explains the expected lower prices. Producers' decisions about redeeming, forfeiting, or placing 1983 loans into the reserve may alter the situation, but currently nearly half of the June 1 carryin is expected to be readily marketable, compared with about a fifth last June.

Because the wheat industry is so dependent upon exporting, a stock drawdown normally reflects expanded export activity. Not so this year: The lower stock level was caused by record domestic disappearance through feeding wheat to livestock. This use, with a steady export volume, resulted in wheat use during June-December 1983 rising to the highest ever--1.64 billion bushels.

U.S. Wheat Exports by Months, Marketing Years 1982/83 and 1983/84



Includes flour and products in wheat equivalent.

featuring. . . . . BEAVERHEAD COUNTY

Located in the extreme southwestern corner of Montana, Beaverhead County abounds in spots of historical interest. Lewis & Clark traversed the county and it derived its name from Beaverhead Rock, named by Lewis & Clark. The ghost town of Bannack was the scene of the state's first great gold discoveries and was Montana's first territorial capital. The Big Hole Battlefield National Monument, commemorating the Battle of the Big Hole, is located in the northwestern corner of the county near Wisdom. The county is bordered on three sides by the Continental Divide and is made up of several broad, rich valleys. The greater portion of the Beaverhead National Forest lies within the boundaries of the county, and it is a popular hunting and fishing area. The county was created in February of 1865 and the county seat is Dillon. This area has an annual average precipitation of 11.10 inches and an average of only 64 frost-free days.

Cattle, sheep and hay are the county's main agricultural concerns. It ranked 1st in cattle numbers and 3rd in sheep numbers in the January 1, 1982 inventory. Hog numbers on December 1, 1981 put the county in 22nd place in the county rankings. The county also ranked 1st in all hay production for the 1982 crop year. Other crops and their respective ranks in 1982 include barley, 34th; all wheat, 36th and oats 39th.

The large numbers of livestock in the county brought in $33,306,000 in cash receipts for 1982. Crop cash receipts totaled $7,197,000, while government payments added $747,000. This brings the total cash receipt return in 1982 to $41,250,000.

MONTANA'S CATTLE HERD INCREASES

Montana cattle numbers continue to increase, a trend that started back in 1979 and is opposite of the National downward trend. Most ranchers generally had good hay supplies going into the winter. This, coupled with poor calf prices last fall, prompted many cattlemen to hold calves over in anticipation of better prices in the spring. The holdover included a higher proportion of heifer calves being held as possible additions to the beef cow herd.

LIVESTOCK PRICES IMPROVE

Prices received by Montana farmers in January for livestock were generally higher but grain prices were lower than the previous month. Compared with a year earlier, prices in January for winter wheat and most livestock items were lower, while spring wheat, durum, barley, hay, lamb and hog prices were higher.

The mid-January index of prices received by Montana farmers for all farm products was 144 (1977=100)--3 percent above December 1983, and 1 percent under January 1983. The all crops index at 149 was 2 points under a month ago, but 5 points above last year. The livestock and products index at 139 was 9 points above December but 6 points under last year.

Nationally, the January all farm products index of prices received by farmers increased 3 points (2.1 percent) from December to 143 percent of its January-December 1977 average. Higher prices for cattle, eggs, tomatoes, hogs and broilers were partially offset by lower prices for oranges, lettuce, soybeans, cotton and milk. The index was 15 points (12 percent) above a year ago.

The index of prices paid by farmers for commodities and services, interest taxes and farm wage rates for January 1984 was 164 percent of the 1977 base. The index was up 1 point (0.6 percent) from December and 6 points (3.8 percent) above January 1983. The annual updating of the indexes for farm services and cash rent, interest on the farm real estate debt and farm real estate taxes caused most of the increase from a month earlier.

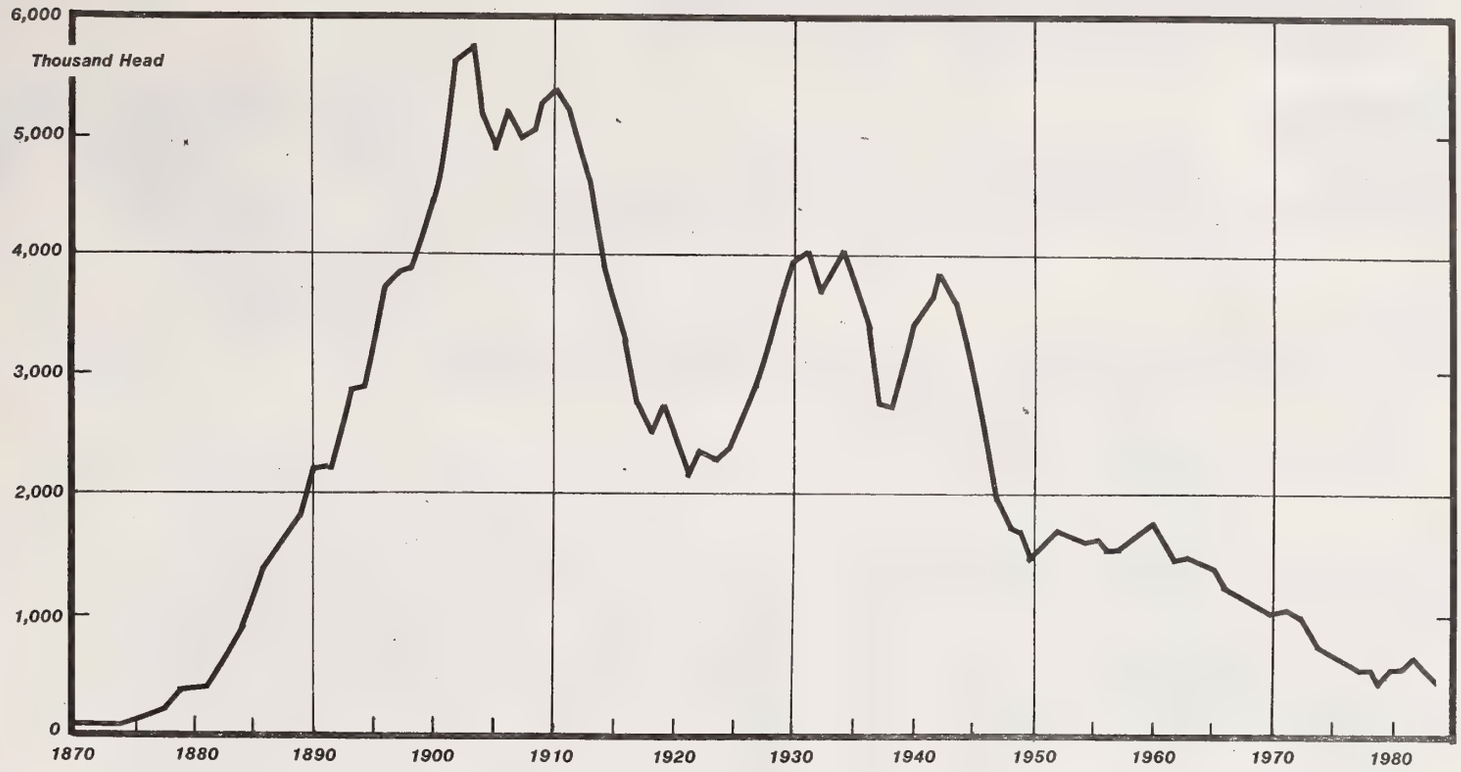
CHICKEN NUMBERS DOWN

The number of chickens on Montana farms December 1, 1983 totaled 940,000--3 percent below a year earlier. The inventory included 730,000 hens and pullets of laying age and 205,000 pullets not of laying age. The inventory value of all Montana chickens December 1, 1983 fell 16 percent to $1,833,000. The average value per bird at $1.95 was 30 cents less than the previous year.

STOCK SHEEP INVENTORY

JANUARY 1, 1870 - 1984



SHEEP NUMBERS CONTINUE DECLINE

Montana's January 1 sheep and lamb inventory was 9 percent less than the previous year. Except for the 1979-82 period, sheep numbers in Montana have been on a long term gradual decline.

Breeding ewes 1 year old and older were down 9 percent pointing to a smaller lamb crop for 1984. Ewe lambs kept for flock replacement were down 24 percent indicating a continued decline of sheep numbers in the State.

Nationally, the January 1 all sheep and lamb inventory was down 5 percent and was the lowest all sheep and lamb inventory on record.

MANUFACTURED DAIRY OUTPUT

Montana dairy plants produced 454,000 pounds of creamed cottage cheese during December 1983, down 8 percent from November, but up 10 percent from a year ago. Ice cream output at 98,000 gallons was 16 percent below the same month a year ago. Butter production at 237,000 pounds was up 10 percent from the previous December.

THE USSR GRAIN SITUATION

Soviet buyers continued to be fairly active in the world grain market during the past month. Total purchases now are estimated at more than 22 million tons or about 80 percent of projected 1983/84 imports of 30 million tons. The estimate of Soviet total grain imports has been increased by 1 million tons reflecting a higher wheat import estimate. Imports for the first 6 months of the July-June marketing year are estimated at over 14 million tons with wheat accounting for 2 out of every 3 tons of grain imported during the period. Soviet wheat purchases for delivery in 1983/84 are estimated at around 16 million tons, while recent purchases of U.S. corn have pushed coarse grain coverage to more than 6 million tons.

MONTANA CROP VALUES

Montana farmers and ranchers harvested crops valued at 978 million dollars during 1983--15 percent below 1982. The lower total value was mainly the result of decreased production which more than offset a generally higher price per unit of production in 1983.

MONTANA CROP VALUES -- 1983

MONTANA WHEAT STOCKS DOWN SHARPLY

Montana wheat stored in all positions totaled 160.1 million bushels as of January 1st, 20 percent below last year's holdings. Indicated disappearance since October 1 was 43.5 million bushels. Disappearance for the comparable period in 1982 was 37.7 million bushels. Farm storages held 130.1 million bushels--25 percent below a year ago, but commercial storages held 30.0 million--up 7 percent.

Winter wheat stocks at 86.5 million bushels were 2 percent below last year. All spring wheat was down 34 percent at 73.6 million bushels. The durum portion at 12.3 million bushels was down 29 percent from last year.

Barley stocks in all positions at 46.3 million bushels were 8 percent below last year. Oats stocks at 5.7 million bushels were down 22 percent.

NATIONAL WHEAT STOCKS DIP SLIGHTLY

Nationally, all wheat stored in all positions January 1, 1984 totaled 2.32 billion bushels, 8 percent less than last year's record 2.52 billion bushels, but 7 percent more than January 1, 1982. Farm stocks amounted to 1.01 billion bushels, down 13 percent from a year ago, and 43 percent of all stocks. Off-farm stocks, at 1.31 billion bushels were off 3 percent from January 1, 1983. Indicated disappearance during October-December 1983 is 642 million bushels. Disappearance for the comparable period in 1982 was 467 million bushels.

Durum wheat stored in all positions on January 1, 1984 totaled 133 million bushels, down 30 percent from last year's record high 189 million bushels and 13 percent less than January 1, 1982. Farm stocks of 97.8 million bushels are 37 percent below the 156 million bushels on hand January 1, 1983. Off-farm stocks of 35.0 million bushels, are 5 percent more than last year's 33.3 million bushels.

Barley stored in all positions on January 1, 1984 totaled 378 million bushels, 10 percent less than last year's 418 million bushels. Stocks of barley stored on farms amounted to 257 million bushels, or 68 percent of the total stocks. Off farm storages held 121 million bushels on January 1, or 32 percent of the total stocks. On farm stocks were down 13 percent and off farm stocks were down 2 percent from January 1, 1983.

RED MEAT PRODUCTION

Commercial red meat production in Montana during December totaled 4.8 million pounds, 2 percent less than the November total. The total red meat production in the state for all of 1983 at 118.3 million pounds is 6 percent under 1982.

There were 8,500 cattle killed and 2,400 hogs slaughtered during December. For the year 1983 there were 99,100 cattle killed, up 8 percent from 1982, and 354,100 hogs slaughtered, down 20 percent from the previous year.

Commercial red meat production in the United States for December 1983 totaled 3.39 billion pounds. Production during 1983 totaled 38.9 billion pounds. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms. Kill days for December included 22 weekdays (1 holiday) and 5 Saturdays.

Beef production for December totaled 1.97 billion pounds. Total head killed was 3.17 million and live weight averaged 1,070 pounds. Veal production was 37 million pounds. Calf slaughter of 284 thousand head averaged 227 pounds live weight. Pork production during December totaled 1.35 billion pounds. Hog kill totaled 7.82 million head, with an average live weight of 243 pounds. Lamb and mutton production was 30 million pounds. The monthly head kill was 551 thousand, averaging 111 pounds live weight

MILK PRODUCTION UP

Milk produced by Montana dairies during the October-December 1983 quarter totaled 87 million pounds, 4 percent more than the same quarter in 1982. The current quarter's production is 4 percent less than the 1983 July-September quarter. The number of cows milked during the past quarter averaged 29,000, same as last year and last quarter.

OCTOBER-DECEMBER MILK PRODUCTION

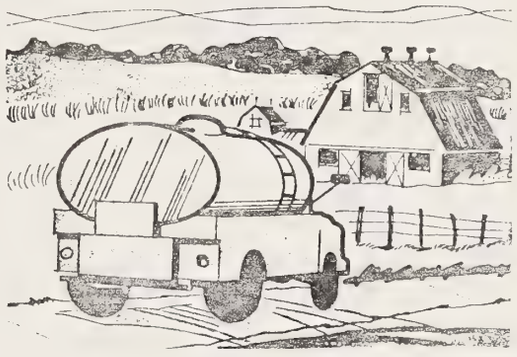
1/ Quarterly average includes dry cows, excludes heifers not yet fresh. 2/ Excludes milk sucked by calves.



POTATO STOCKS DOWN

Fall potato stocks totaled 161 million cwt on January 1, 1984, for the 15 major storage states. This is down 10 percent from a year ago and 2 percent below the January 1, 1982 stocks. By variety, potatoes were 70 percent russett, 26 percent white and 4 percent red. The storage total accounted for 58 percent of fall potato production compared with 60 percent a year ago.

In Montana, producers had 1.67 million cwt in storage, down 6 percent from last year. This reflects a 6 percent decrease in the 1983 production compared with 1982.

featuring. . . . . RAVALLI COUNTY

The entire western boundary and half of the southern boundary of Ravalli County comprise a part of the Montana/Idaho border. The county itself occupies 1,524,480 acres of land in western Montana. Much of this land is the Bitterroot National Forest. The Bitterroot River runs through the center of the county from its northern to its southern border, through what is known as the Bitterroot Valley. The Bitterroon mountain range, which is part of the Selway-Bitterroot Wilderness Area lies on the western border of the county.

Hay is the major crop grown and ranked the county 12th in all hay production for the 1982 crop year. Some wheat, barley and oats are also grown. These crops brought the county rankings of 48th, 42nd and 34th respectively in 1982 production.

Ravalli County was 19th in the state for sheep numbers and 26th in cattle on January 1, 1982. Hog numbers in 1981 put the county in 24th place in the state.

Cash receipts from livestock and livestock products contributed $15,693,000 and a rank of 14th in 1981, while crops turned $4,146,000 and a rank of 39th among the counties. Government payments added $216,000 for a total cash receipt return of $20,055,000 and 31st place in 1981.

Hamilton is the county seat, and this area has an annual average precipitation of 13.11 inches. The high mountain ranges on either side of the Bitterroot Valley provide protection and afford the county a mild, even climate.

MONTANA FARM PRICES FOR DECEMBER
1984 WINTER WHEAT SEEDINGS
HAY STOCKS DOWN
featuring.....McCONE COUNTY

FARM FINANCES STRENGTHEN

Financial conditions for U.S. farmers have generally stabilized, even though some farmers still face difficulties. Conditions in mid-December show that the 1983 drought and acreage reduction programs helped raise sectorwide farm income and cash flow, but that real farm income (after adjusting for inflation) has remained relatively low. Livestock producers' returns have suffered from high feed costs and low product prices, and high interest rates continue to plague farmers struggling with large debts.

For the year ending June 1983, the delinquency rate on farm loans at agricultural banks was about 3.7 percent, and the percentage of farmers who went out of business was about 2.3. Both figures are unchanged from a year earlier. However, a larger number went through bankruptcy, 1.1 percent compared with 0.75 percent a year earlier.

Prospects for 1984 suggest farm income will continue to increase, compared with the past few years. The index of prices received by farmers is forecast to average 5 to 7 percent higher. The index of prices paid for all items may also climb 5 to 7 percent, while nonfarm origin inputs may be up 4 to 6 percent.

As farm income and planted acreage increase in 1984, farm investments could advance $3 billion. Last year's gross investment is estimated at $19.1 billion, down $1.5 billion from 1982. The decrease came from high participation in acreage reduction programs, high interest rates, and improved but still sluggish farm income, which kept many farmers from making capital improvements and from purchasing machinery and equipment.

MONTANA 1983 CROP SEASON REVIEW

Montana had large areas of moisture shortages in 1983, especially in the eastern sections. The state's farmers also participated heavily in acreage reduction programs which resulted in a 25 percent decrease in all wheat production. However, barley production for the state set a new record high for the second straight year.

Winter wheat seeding in the fall of 1982 got off to a slow start as many growers were waiting for moisture before they started seeding the 1983 crop. However, precipitation the last of September came in time for seeding to progress and by the last of October the crop was in the ground.

Moisture received during the winter months was generally below average. Fieldwork got started the first of April and proceded faster than normal. By the last of May, most of the spring grains had been planted which was much earlier than normal.

The main growing season was characterized by dry areas in the northwest, southeast and the eastern third of the State. Hay harvest accelerated during June, but persistent scattered showers ruined or lowered the quality of much of the first cutting hay crop when it was down. Above normal temperatures starting the first part of August hastened maturity of small grains, but provided good harvesting conditions. Harvest of spring grains progressed more rapidly than normal. Winter wheat harvest was in the wind-up stage by the latter part of August and harvest of spring grains was essentially complete by mid-September, both earlier than normal. The dry bean and corn silage harvest were in full swing by this time. The potato harvest was finished in late October while the sugarbeet harvest carried over to early November.

MONTANA FARM PRICES STRENGTHEN

Montana farmers received lower prices for all grains but higher prices for livestock at mid-December compared with November. Hay prices remained unchanged. In comparing the current December prices with a year ago, winter wheat is down while hard spring wheat and durum are up. Barley prices are up significant this year, while hay is showing only a moderate increase. Most livestock prices except hogs and sheep are higher than a year ago.

The all farm products price index for this December at 142 compares with 137 a year ago.

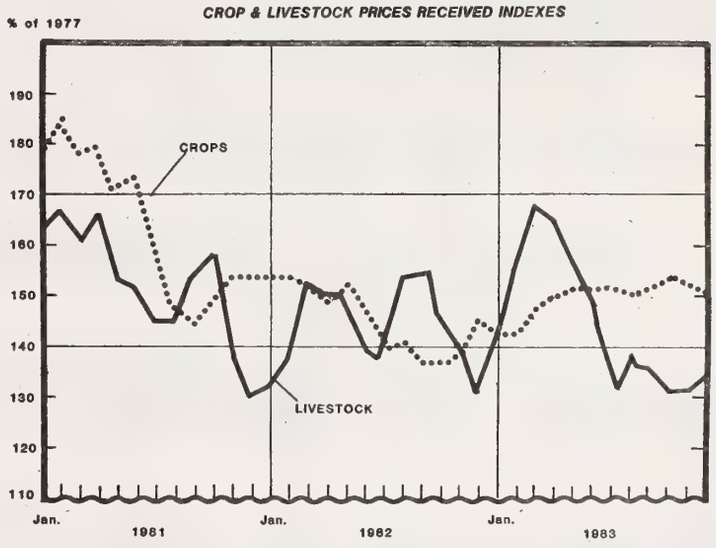
MONTANA

CROP & LIVESTOCK PRICES RECEIVED INDEXES



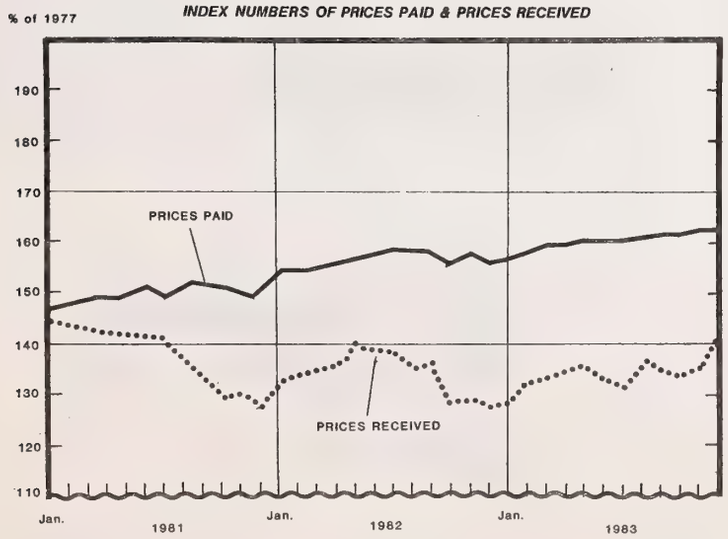
HAY STOCKS BELOW LAST YEAR

Hay stocks January 1 on Montana farms and ranches totaled 3,950,000 tons--down 14 percent from the same date last year. The severe cold weather during December increased feeding requirements considerably and started depleting hay supplies earlier than normal. As a result, some areas may have shortages depending on weather and feeding requirements for the rest of the winter.

The U.S. hay stocks on farms January 1 totaled 90.7 million tons, down 15 percent from a year earlier.

UNITED STATES

INDEX NUMBERS OF PRICES PAID & PRICES RECEIVED



WINTER WHEAT SEEDINGS FOR 1984

Montana farmers planted 2.7 million acres of winter wheat this past fall for harvest in 1984--up 6 percent from a year ago. Most major winter wheat producing states indicated acreage increases. The only ones registering declines were Colorado, Ohio, Oklahoma and Texas.

The Nation's farmers seeded 64.9 million acres of winter wheat for harvest in 1984. This is up 4 percent from 1983, but down 2 percent from the record 66.5 million acres seeded for 1982.

featuring..... McCONE COUNTY

McCone County is situated in the northeastern section of Montana with the Missouri River defining its northern border. A leg of the Fort Peck Lake lies just on the western boundary of the county. The county itself is characterized mostly by plains, although the land along the northern bounday is broken up by the Missouri Breaks along the river. The county was created in April of 1919 and has an approximate land area of 1,668,480 acres.

A variety of crops are grown on the 1 million plus acres of farmland in the county. McCone ranked 7th in spring wheat production for the 1982 crop year, 9th for durum wheat and 12th in winter wheat production. Oats and barley are also grown extensively as the county ranked 10th in oats production and 18th in barley production in 1982. Cash receipts for these crops brought in $19,323,000 or a ranking of 20th in 1981 cash receipts.

McCone is also one of the major sheep raising counties as it ranked 5th in the state for sheep numbers in 1982. Cattle and hogs both brought the county rankings of 32nd in 1982 livestock numbers. Cash receipts for livestock and livestock products totaled 8,704,000 in 1981 and ranked 34th among the counties.

Adding the cash receipts for crops and livestock, plus government payments, brings the total cash receipt figure to $31,461,000 in 1981 and 24th place in the county rankings.

1984 WINTER WHEAT SEEDINGS
MONTANA HOG INVENTORY INCREASES
POTATO STOCKS
1983 SMALL GRAIN SUMMARY
SLAUGHTER DECREASES

WORLD WHEAT OUTLOOK

The world wheat trade forecast for 1983/84 is unchanged from last month at over 100 million tons. The current world wheat market is characterized by aggressive marketing of near-record supplies. World demand has expanded somewhat since the start of the marketing year; however, exportable supplies still exceed import demand and world wheat stocks are expected to show a modest increase. The amount of wheat traded for feed this year continues to be a major uncertainty. There are still indications that wheat feeding could increase further, illustrated by renewed EC attempts to direct more wheat into domestic feed use.

The Soviet Union, China and Brazil have been active in the world wheat market over the past month. The USSR made a major purchase from Australia and has also bought significant amounts from the United States for 1983/84 delivery. China bought large quantities of Canadian wheat for shipment by July 1984 and made known that it would purchase additional grain, presumably wheat, under the U.S.-China Long-Term Grain Agreement. Brazil has bought about 400,000 tons of Argentine wheat, its first purchase from Argentina since July-June 1981/82.

WINTER WHEAT SEEDINGS FOR 1984

Montana farmers planted 2.7 million acres of winter wheat this past fall for harvest in 1984--up 6 percent from a year ago. Moisture supplies were generally short over most of the State at the beginning of seeding. However, a mid-September snowstorm brought much needed moisture. Seeding was generally completed by mid-October.

The 1984 crop is currently reported in good condition and snowcover is protecting against winter kill and wind damage.

1/ Total area seeded for all purposes.

MONTANA'S WHEAT CROP DOWN

All wheat production in Montana was down 25 percent from the record levels of last year because of both lower yields and fewer acres for harvest. Total production at 136.9 million bushels was the lowest since 1980. Barley production, however, was at a new record high for the second straight year. Many farmers diverted wheat acreage to barley to meet requirements for the P.I.K. program. Production, at 77.7 million bushels, was 2 percent higher than last year's record crop. Oats production, at 5.3 million bushels, was down 31 percent as yields fell 7 bushels per acre on 20 percent fewer acres harvested. Overall, total small grain production was down 18 percent in Montana with 219.9 million bushels produced.

Winter wheat production at 79.1 million bushels, fell only 2 percent during 1983. Harvested acres were actually up 7 percent as farmers chose not to divert acres which had already been seeded the previous fall. A reduced yield of 3 bushels per acre lowered production despite more acres for harvest. Spring wheat took the brunt of the diversion program in Montana as nearly a million fewer acres were harvested in 1983. Spring wheat yields were also 5 bushels per acre lower than last year resulting in 42 percent less production at 53.7 million bushels. The P.I.K. program, combined with considerably poorer prices, led to a 60 percent reduction in durum wheat during 1983. Yields were down 10 bushels per acre on 40 percent fewer acres resulting in production of 4.1 million bushels.

NATIONAL PRODUCTION DOWN

All wheat production for the Nation totaled 2.4 billion bushels--down 14 percent from the 1983 record high. Barley production at 519 million bushels was down 1 percent. Oats production at 477 million bushels was down 23 percent from last year.

End of season statistics for all other crops will be released January 13, 1984.

POTATO STOCKS DOWN

December 1, 1983 potato stocks totaled an estimated 187 million cwt (8.49 million metric tons) for the 15 States in the Stocks Program. This is down 9 percent from last year and 3 percent below 1981. Of the total stocks in the 11 objective yield states, 72 percent were russets, 24 percent whites, and 4 percent reds.

Storage in the six Western States contained 119 million cwt, down 9 percent from last year and 2 percent from 1981. Idaho stocks were set at 59.5 million cwt, off 14 percent from last year in the wake of heavy fall shipments. Oregon sheds held 14.0 million cwt of tubers, 7 percent below last year. Washington stocks at 29.2 million cwt remained unchanged.

Disappearance so far this season totaled 90.7 million cwt, slightly above last season, but 3 percent short of 2 years ago. This includes 13.8 million cwt of potatoes dumped during grading, fed on farms where produced, discarded without grading, and lost to shrinkage (moisture loss).

MONTANA EGG PRODUCTION STEADY

Montana's laying flocks produced 48 million eggs during the September-November quarter, identical with the same quarter in 1982. The average number of layers on hand during the quarter was 740,000, down 4 percent from the same quarter a year ago.

The Nation's laying flocks produced 16,626 million eggs during the September-November quarter--down 5 percent from last year. The number of layers during the quarter averaged 272,521--down 4 percent from the same quarter in 1982.

MONTANA HOG NUMBERS UP

The Montana December 1 all hog and pig inventory, at 180,000, is up 17 percent from last year. Hogs on hand for breeding, at 21,000, are up 5 percent while market hogs at 159,000 are up 19 percent from a year ago.

Montana's 1983 pig crop totaled 256,000 head, the same as the previous year. The spring pig crop (December-May) at 128,000 was down 16 percent, but the fall pig crop (June-November) also at 128,000 was up 23 percent from a year ago.

Nationally, the U.S. inventory of all hogs and pigs is estimated at 55.8 million head on December 1, 1983. This is 3 percent above a year ago but 5 percent less than December 1, 1981.

--Breeding hog inventory, at 7.35 million, is 1 percent below last year and down 6 percent from two years ago.

--Market hog inventory, at 48.5 million, is 4 percent above a year earlier but 5 percent less than two years ago.

The U.S. pig crop for 1983 totaled 92.2 million head, 10 percent above 1982 but 2 percent below the 1981 pig crop.

--December 1982-May 1983 pig crop, estimated at 46.8 million head, is up 14 percent from a year earlier but 2 percent below the comparable period two years ago.

--June-November 1983 pig crop, estimated at 45.5 million head, is 6 percent greater than a year ago but 2 percent below the June-November 1981 crop.

U.S. hog producers intend to have 5.90 million sows farrow during the December 1983-May 1984 period, 5 percent below a year ago but 6 percent greater than two years ago.

MONTANA RED MEAT PRODUCTION

Commercial red meat production in Montana during November at 4.9 million pounds was 38 percent below October. The January-November accumulated total was 113.5 million pounds.

There were 8,700 head of cattle slaughtered and 3,000 head of hogs killed during November. The cattle kill was down 6 percent, while the hog kill declined 82 percent from the previous month.

NATIONAL SLAUGHTER

Commercial red meat production in the United States for November 1983 totaled 3.47 billion pounds. The January-November accumulated red meat production totaled 35.5 billion pounds. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

Kill days for November included 22 weekdays (2 holidays) and 4 Saturdays.

Beef production for November totaled 1.94 billion pounds. Total head killed was 3.08 million and live weight averaged 1,077 pounds.

Veal production was 39 million pounds. Calf slaughter of 294 thousand head averaged 229 pounds live weight.

Pork production during the month totaled 1.47 billion pounds. Hog kill totaled 8.43 million head, with an average live weight of 246 pounds.

Lamb and mutton production was 29 million pounds. Head kill of 528 thousand averaged 111 pounds live weight.

MONTANA FERTILIZER CONSUMPTION INCREASES

Montana farmers applied 2 percent more fertilizer during the year ended June 30, 1983 than the year before.

Of the primary plant nutrients consumed, nitrogen made up 58 percent, available phosphate 37 percent, and potassium 5 percent. This was almost the same as the previous year except that nitrogen use increased slightly while phosphate and potassium each dipped. The total primary nutrient tonnage at 205,121, accounted for 52 percent of the gross tonnage applied.

Most of the nitrogen (80%) was applied as direct application material. Of the total nitrogen direct application material, anhydrous ammonia accounted for 26 percent, ammonium nitrate 33 percent, ammonium sulphate 6 percent, nitrogen solutions 11 percent, urea 21 percent and other 3 percent.

The majority of the phosphate (92%) was applied as a mixture. Of the total mixtures, 11-55-0 accounted for 40 percent, 18-46-0 38 percent, 10-34-0 8 percent, and other mixtures the remaining 14 percent

U.S. FERTILIZER USE DOWN

Fertilizer consumption in the U.S. and Puerto Rico during the year ended June 30, 1983 was 42.3 million tons, down 13 percent from a year earlier. Nitrogen consumption decreased 16 percent, and phosphate and potash usage were each down 14 percent.

SEASON'S GREETINGS

The economic situation for many Montana farm and ranch families certainly isn't the best, but our state was fortunate to avoid the heavy production losses that impacted the midwestern states. We are indeed blessed to live in a country where the climate and soil enable our farmers to produce enough food to feed all Americans plus many in the rest of the world. Even in a year when production of most crops was down sharply there is still plenty of food for all.

Yet, it's sometimes difficult to realize there are those who go without even in a country where the 'good life' is the norm. In fact, life has been so good to most of us that it's difficult to identify with the father or mother who can't provide enough food or clothing for their children, or with others who are without friends or family. They have nowhere to turn except to the kindness and consideration of those who are more fortunate.

Most of us have struggled with adversity at sometime in our lives. It's during those times a helping hand is most appreciated. Let's remember to share our blessings during the Holiday Season and throughout the New Year.

Merry Christmas and Happy New Year!

WHEAT SITUATION BY CLASS

HARD RED WINTER CROP DOWN—SUPPLY STILL SETS RECORD

The 1983 hard red winter wheat crop of 1.19 billion bushels is the second largest on record. Ideal growing conditions and improved varieties offset a reduction of nearly 7 million harvested acres. Quality of the crop was reduced in terms of protein and baking quality. However, test weights, average grade and milling quality are up.

The total 1983/84 hard red winter supply will top 1.9 billion bushels, 151 million more than last year's record.

Feed use is expected to surge while exports are projected to be slightly under last year's 679 million bushels.

HARD RED SPRING CROP CUT SHARPLY--FREE STOCKS TO INCREASE

Heavy compliance in the acreage reduction programs coupled with sharply lower yields reduced total production to 313 million bushels--down more than a third from last year. However, record carryover stocks were offsetting and the 1983/84 hard red spring supply is only 13 percent under last year's record 852 million bushels.

Quality of this year's crop is exceptional. This could encourage both more domestic and export use, except that Canada could offer heavy competition.

Immediate entry into the farmer-owned reserve is not a marketing option this year which will expand free stocks.

DURUM CROP REDUCED—SUPPLY DOWN

Heavy participation in the 1983 wheat program pushed plantings to the lowest since 1970. Although the 72 million bushel crop is down sharply, a record carryover will be somewhat offsetting. The 1983/84 supply will be only 43 million bushels short of last year's record 249 million.

World durum production is also down giving rise to an expected 20 percent increase in exports.

There are 100 million bushels of durum in the farmer-owned reserve that are not now marketable. However, 1983 P.I.K. participants will receive entitlements that could release up to half these stocks because spring wheat producers who have both hard red and durum in the reserve can specify the class they want to receive as their P.I.K. entitlements.

SOFT RED WINTER SUPPLY OFF SHARPLY

Heavy participation in the acreage reduction programs, not drought, reduced production 102 million bushels. The total supply for the 1983/84 marketing year is down 13 percent, and the smallest in three years.

Domestic feed use is expected to be larger than export use, an event unparalleled for any wheat class in the era of expanding exports.

LARGE WHITE WHEAT HARVEST CREATES RECORD SUPPLY

Although plantings were reduced record yields produced the third largest crop on record. With a record carryin the total supply rose to 470 million bushels--the largest ever.

FARM INCOME PROSPECTS FOR 1983

Farm income prospects during 1983 remain stronger than a year earlier. Although the forecast for net farm income, including inventory adjustment, has fallen to $24 to $26 billion, from the $25 to $29 billion set this summer, all the drop is due to declining inventories. Because this summer's drought cut output sharply, the value of crop inventories is now expected to fall $6 to $8 billion; stocks at the end of 1983 (excluding those under government loans) will likely drop below those of a year earlier. The value of livestock inventories is expected to remain about equal to 1982, as higher hog numbers offset lower cattle and sheep herds.

Net cash income, including loans by the Commodity Credit Corporation (CCC), is forecast between $42 and $44 billion, surpassing the 1980 high of $38.1 billion. In 1972 dollars, net cash income may range from $19 to $20 billion, also the highest since 1980's $21.3 billion. Total cash income is expected to rise to about $153 to $155 billion because of the Government's increased cash and in-kind payments. About $4 billion of the gain in net cash income are expected to come from a 3 percent decline in cash expenses.

MONTANA DAIRY PRODUCTS

Montana dairy plants produced 508,000 pounds of creamed cottage cheese during October--up 29 percent from a year ago. Ice cream production at 138,000 gallons was up 14 percent, while butter made at 180,000 pounds was down 10 percent. American cheese production at 163,000 pounds was down 22 percent from last year.

NOVEMBER FARM PRICES

Montana farmers received higher prices for field crops at mid-November 1983 than a year ago, but generally less for livestock. Hard spring wheat, durum, barley and oats had substantial price gains over a year ago while winter wheat held about steady. All classes of beef cattle were moderately cheaper this mid-November, while hogs had sharp price declines.

At mid-November, Montana farmers received 6 cents more per bushel for winter wheat than the U.S. average; 9 cents more for durum wheat; 2 cents more for hard spring wheat; 18 cents less for barley and oats.

The all crops price index (1977=100) at 138 is up 9 points from last year, while the all livestock and products price index at 126 fell 11 points. This placed the all farm products index at 138, the same as a year ago.

Nationally, the November all farm products index of prices received by farmers increased 1 point (.7 percent) from October to 135 percent of its January-December 1977 average. Higher prices for corn, oranges, eggs, broilers and cotton were partially offset by lower prices for hogs, grapefruit, lettuce, wheat and cattle. The index was 7 points (5.5 percent) above a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for November was 162 percent of the 1977=100 base. The index was up 1 point (.6 percent) from last month and was 6 points (3.8 percent) above November last year. The November feeder livestock and feed components increased from a month earlier. Lower prices for fuels and energy were partially offsetting.

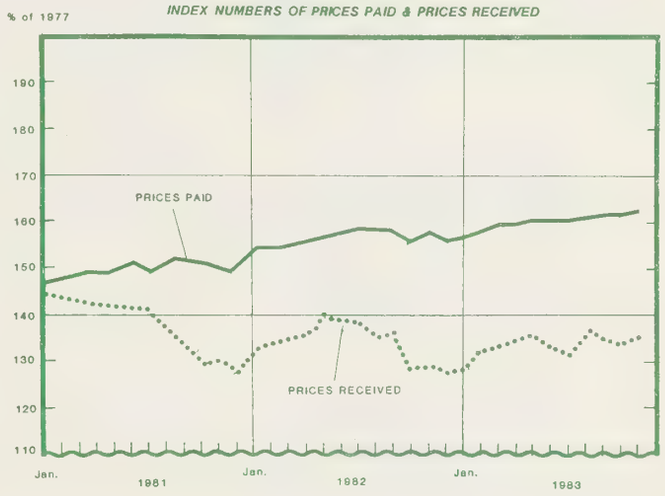
INDEX NUMBERS OF PRICES PAID & PRICES RECEIVED



featuring. . . . . LEWIS and CLARK COUNTY

The area now known as Lewis and Clark County attracted its first settlers with its rich placer gold deposits. Located in west central Montana, the county occupies 2,225,920 acres of land. The Sun River comprises the northern boundary of the county, and a chain of bodies of water including a portion of the Missouri River, Holter Lake, Lake Helena, Hauser Lake, and part of Canyon Ferry Lake traverse the eastern section of the county from north to south. Nearly half of the county is blanketed by portions of the Helena and Flathead National Forests. The Continental Divide of the Rocky Mountains runs down the center of Lewis and Clark County.

When the gold strikes in the county played out, livestock raising and agriculture began to come into their own as an industry. In the 1982 livestock inventory, Lewis and Clark County ranked 13th in sheep numbers and 27th in cattle numbers. The December 1, 1981 hog inventory shows the county in 28th place.

Of the durum wheat producing counties, Lewis and Clark County ranked 17th in 1982 production. The county ranked 20th for all hay production, 33rd for barley, 38th for all wheat and 39th for oats production in 1982.

Livestock and livestock products in Lewis and Clark County brought in receipts of $12,145,000 and a rank of 24th in 1981. Crops added $3,664,000 for 42nd place in the county rankings, while government payments contributed $346,000 for a total cash receipt return of $16,155,000 and a rank of 37th among Montana counties in 1981.

Lewis and Clark County is home to Montana's historic capital city, Helena, which is also the county seat. This area has an annual average precipitation of 11.37 inches and an average of 124 frost free days.

MONTANA RED MEAT PRODUCTION

Commercial red meat production in Montana during October at 7.9 million pounds was 35 percent below September. The January-October accumulated total was 108.7 million pounds.

There were 9,300 head of cattle slaughtered and 16,900 head of hogs killed during September. The cattle kill was down 9 percent, while the hog kill declined 55 percent from the previous month.

Nationally, commercial red meat production in the United States for October 1983 totaled 3.53 billion pounds, up 3 percent from September. January-October accumulated red meat production totaled 32.1 billion pounds. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms. Kill days for October included 21 weekdays (1 holiday) and 5 Saturdays.

Beef production for October totaled 2.07 billion pounds, down 1 percent from September. Total head killed was 3.28 million and live weight averaged 1,070 pounds.

Veal production was 41 million pounds. Calf slaughter of 290 thousand head averaged 239 pounds live weight.

Pork production during the month totaled 1.39 billion pounds, up 9 percent from the previous month. Hog kill totaled 8.09 million head, with an average live weight of 243 pounds.

Lamb and mutton was 32 million pounds, down 3 percent from September. Head kill of 600 thousand averaged 109 pounds live weight.

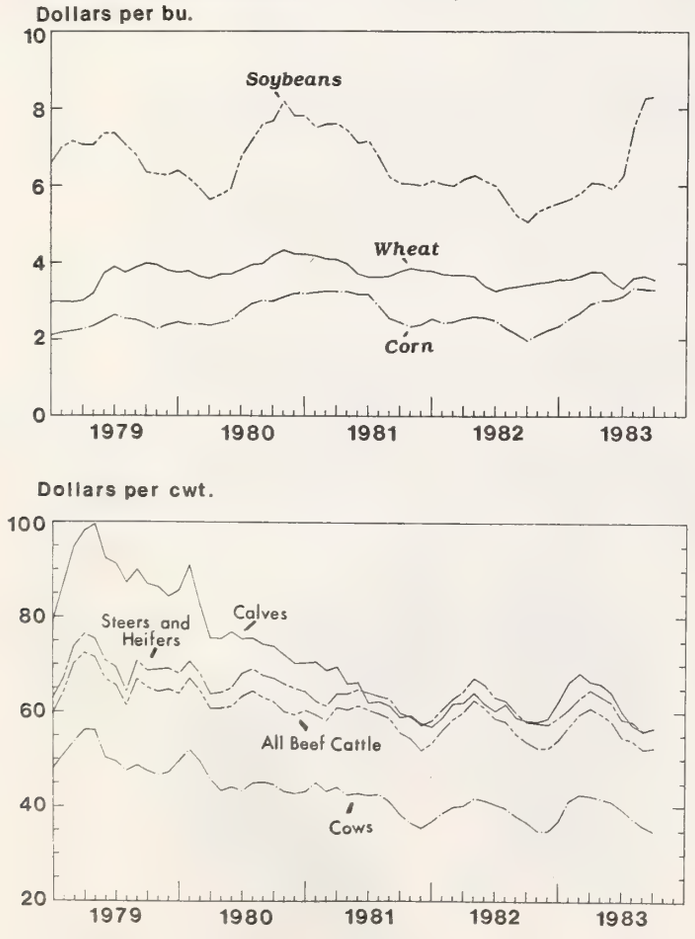
FEED GRAIN USE TO EXCEED OUTPUT, PULLING DOWN STOCKS

In 1983/84, corn and sorghum use will exceed production by a wide margin, resulting in a large drop in carryover stocks next year. Prices are expected to average well above a year earlier. The Payment-In-Kind program and this summer's drought reduced the harvest of corn and sorghum to 116.9 million metric tons, less than half 1982's 234.7 million.

Record high stocks partly offset the impact of the reduced harvest. Stocks of corn, sorghum, barley and oats amounted to 108.6 million tons on October 1--24 million larger than a year earlier. Thus, the supply of feed grains going into the fall and winter totals 216 million tons--about 32 percent less than last year's 320 million and the lowest since fall 1977. The feed grain supply will be augmented by a small amount of imports and by barley and oat harvests next summer.

In several areas, wheat prices were significantly less than those for corn and sorghum, prompting a shift to wheat feeding. As a result, an estimated 270 million bushels of wheat were fed to livestock and poultry during June-September--about 37 percent more than a year earlier. Corn and sorghum prices remain at a premium to wheat, and December futures prices imply more of the same. Consequently, wheat feeding is expected to continue well above a year earlier through fall and winter.

Prices Received by Farmers, US



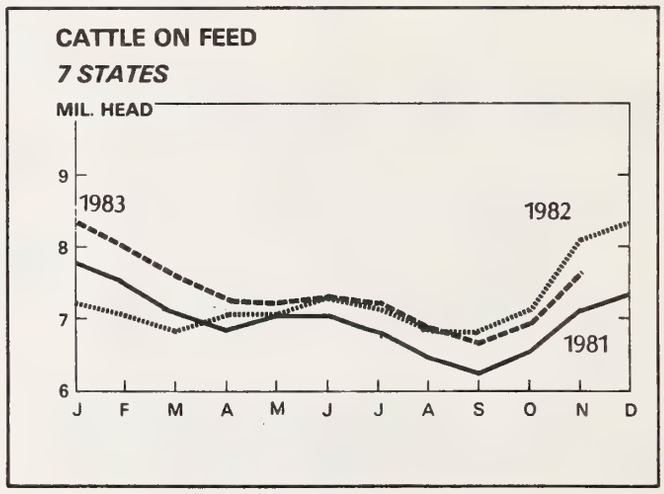
CATTLE ON FEED IN 7 STATES DOWN 6 PERCENT

Cattle and calves on feed November 1 for slaughter market in the 7 States preparing monthly estimates totaled 7.68 million, a 6 percent decrease from a year ago but 8 percent above November 1, 1981.

Marketings of fed cattle during October totaled 1.63 million, an increase of 6 percent from last year and up 11 percent from October 1981.

Placements of cattle and calves on feed in the 7 States were 2.46 million, down 5 percent from October 1982 but 19 percent above two years ago. Net placements of 2.36 million were down 6 percent from 1982 but 19 percent above 1981.

Other disappearance totaled 102 thousand compared with 83 thousand during October 1982 and 85 thousand two years ago.



FARM ELECTRICITY and TELEPHONE COSTS GO UP

Montana farmers and ranchers paid an average of $56.00 per month during mid-1983 for electric service charges. This represents a 14 percent increase from last year's monthly costs. Usage increased about 11 percent and electricity cost per kilowatt-hour increased 2 percent. Telephone bills averaged $48.90 per month during mid-1983 on Montana farms and ranches, an increase of 14 percent from last year.

Nationally, farmers and ranchers paid an average monthly mid-summer electric bill of $92.50 in 1983 which was 10 percent above 1982. Telephone service for farmers and ranchers averaged $39.20 per month, up 15 percent.

WOOL USE INCREASES

Mill use of wool continues to exceed earlier expectations. During July-September 1983, U.S. mills used nearly 36 million pounds of clean wool, 44 percent more than during third-quarter 1982, and the highest disappearance in 11 years. Larger production of high quality suits, top coats, and sweaters, combined with low prices for carpet wools relative to manmade fibers, account for most of the increase.

Because the U.S. wool industry is relatively small, wool prices in the United States are determined largely by overall world market trends with domestic developments having only a small impact.

Largely because of the Australian drought, world wool production in 1983/84 is forecast to fall 1 percent. The drought appears to have ended in the eastern states of Australia. Nevertheless, Australian sheep numbers on March 31, 1983, had declined by 2.6 percent to 133.2 million head. No significant recovery in the flock is expected through March 1984 and sheep in former drought areas had already lost fleece potential by fall. Consequently, the official forecast puts the 1983/84 Australian clip at 1.48 billion pounds greasy, down 4.4 percent.

THE WHEAT SITUATION

SUPPLIES REMAIN LARGE

The 1983 total U.S. supply of 3.95 billion bushels is only slightly less than 1982, but 4% above 1981 and 21% above 1980.

DOMESTIC USE INCREASES

Total domestic wheat use in 1983 is expected to be 16% above 1982, 26% above 1981 and 39% above 1980. This is mainly due to sharply larger amounts being fed to livestock.

EXPORTS SOFTEN

Because of large global supplies, more agressive competition from other exporters, the continued strength of the dollar, and less buying power by some importers 1983 exports are forecast to be down 7% from 1982. This level of exports will be down 21% from 2 years ago.

ENDING STOCKS TO DECREASE

Because of greater total disappearance in 1983, ending stocks are expected to be 4% under 1982 but still 27% above 1981 and 49% above 1980.

WHEAT PRICES STEADY

Helping prices to go slightly ahead of last year are higher feed grain prices and a higher loan rate.

featuring. . . . . PONDERA COUNTY

Pondera county was created in April of 1919 and comprises 1,045,760 acres of land in north central Montana. It's western border is marked by the Continental Divide of the Rocky Mountains, and a section of the Lewis and Clark National Forest takes up the western corner of the county. Although smaller in size than many of the counties, Pondera County is big on crop production. For the 1982 crop year, Pondera County ranked 2nd in Barley production and 3rd in both winter and durum wheat production. The county ranked 6th for all wheat production.

In livestock numbers for 1981 Pondera County came up 2nd in the hog inventory. Some sheep and cattle are also raised. The county turned up 25th in the county rankings for sheep numbers, and 39th in cattle numbers for 1982.

Crops grown in Pondera County brought in $38,341,000 in cash receipts and 4th place in the county rankings in 1981. Livestock and products turned in $8,178,000 in cash receipts and a rank of 36th, and government payments added $2,149,000 for total cash receipts of $48,668,000 in 1981.

A LOOK AT 1983's DROUGHT
featuring.....BLAINE COUNTY

OCTOBER FARM PRICES

Prices received by Montana farmers and ranchers in October were generally down from the previous month. The October index of prices received for all farm products at 142 (1977=100) was down 3 points from the September index, but was the same as a year ago. The all crops index at 150 was 3 points below September, but 13 points above October 1982. The livestock and products index at 135 was 2 points below a month ago and 11 points below a year ago.

In comparing October prices with September prices, increases were noted for oats, barley, calves, sheep, lambs, milk and eggs. Prices were down or remained the same for other commodities.

Nationally, the October all farm products index of prices received by farmers was unchanged from September at 136 percent of its January-December 1977 average. Higher prices since September for lettuce, strawberries, grapefruit, tomatoes and milk were offset by lower prices for hogs, broilers, potatoes, oranges and wheat. The index was 8 points (6.2 percent) above a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes, and farm wage rates for October was 161 percent of the 1977=100 base. The index was unchanged from September but 5 points (3.2 percent) above a year earlier. The feeder livestock and fertilizer components were lower than a month earlier but increases for the feed and family living components were offsetting.

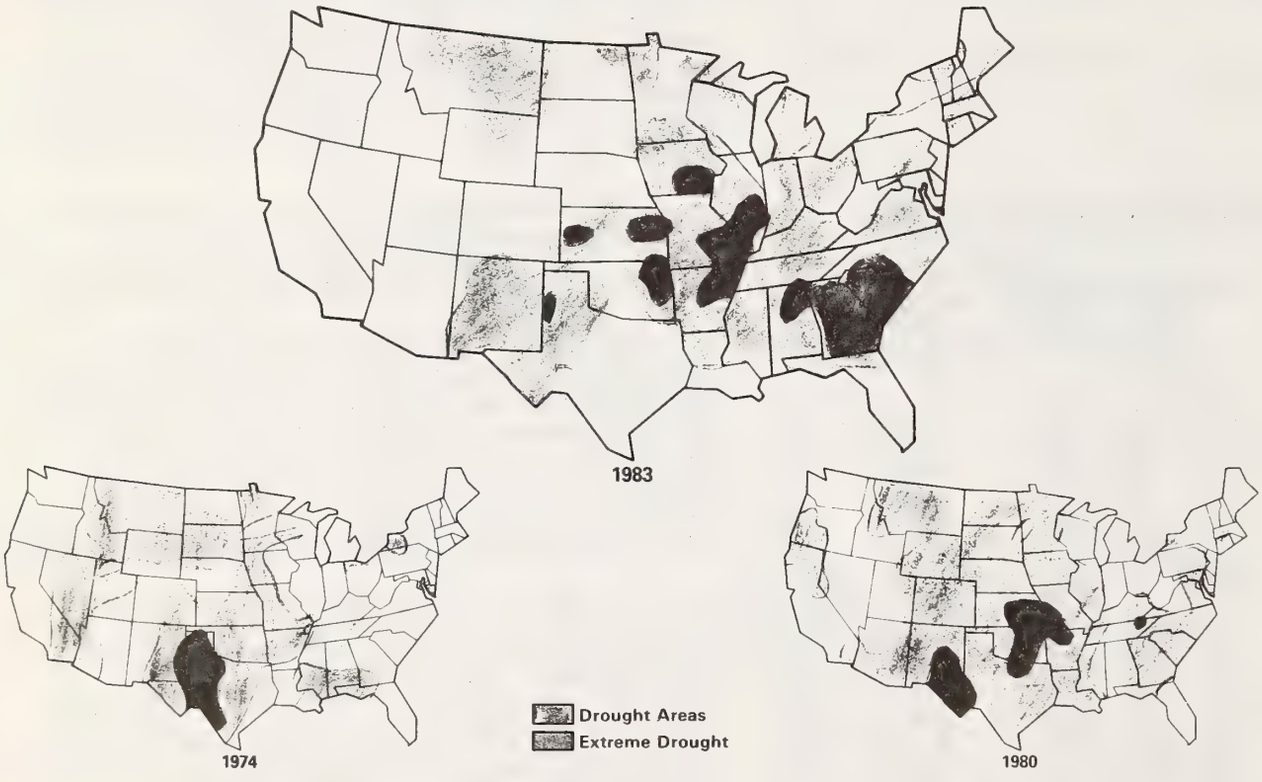
Of Last Three Droughts, 1983 Hit Major Crop Areas Hardest



1983 ACREAGE and PRODUCTION SURVEY

More than 10,000 Montana farmers and ranchers are being surveyed to provide crop production information for the 1983 season. The U.S. Department of Agriculture estimates generated by this annual survey are used in many important ways and have both a direct and indirect bearing on farm program benefits. Crop production for the entire State is derived by using these after harvest reports. County acreage and yield data are obtained and used as basic input to the various farm programs. State and county statistics go into the official record books so that future years may be compared with the past. Producers can use acreage and production figures along with current and historic price information as they plan next year's operations.

The Montana Crop and Livestock Reporting Service is mailing questionnaires to nearly half the farms and ranches in the State. Telephone follow-up will be made to insure adequate returns from each county. Similar surveys will be conducted in other states and final state and national survey results will be published for small grains on December 22, 1983.

WHAT AMERICANS SPEND ON FOOD

Although Americans often complain about the cost of food, they shouldn't--says Lyle Pratt, State Statistician. Based on food cost and income statistics, we spend about 16% of our income on food, beverages and tobacco. This is the lowest percent in 55 countries studied. Only one other country spent less than 20 percent of their income dollar for food--the Netherlands at 19.5 percent. Canadians spend 21 percent for food; in France, 22 percent; United Kingdom, 23 percent; Japan, 25 and the USSR 49 percent.

Because incomes in the United States are relatively high, wouldn't we expect to pay a lower proportion for food? This is partially true. U.S. income was the 6th highest of the 55 countries. But the five countries with higher incomes--Belgium, West Germany, Sweden, Denmark and Switzerland--spend 25 to 29 percent of their incomes for food. Developing countries spend 40-60 percent of their incomes, while those with centrally planned governments spend 30-50 percent.

Pratt said one of the main contributors to low food prices in the U.S. is the production efficiency of American farmers. This capacity to produce, while good for consumers, often adversely affects farm income.

AMERICANS HAVE 4.5 ACRES FOR FOOD

For each American there are 4.5 acres of farmland available to grow food, natural fibers for clothing and lumber. This is down from 50 years ago when the average was over 10 acres. And, the trend is still downward.

Out of the 4.5 acre share for each person, only 2 acres are cropland. However, added to that 2 acres are some very important ingredients.

First and foremost is a farmer with skill, capital, and the willingness to take risk. He must be provided with enough incentive and profit to keep at the job. He has an average investment in each person's 4.5 acre share of $4,274 in physical assets. For this, the average consumer paid the farmer $725 in 1981 for food and other farm products.

The farmers used this $725 to pay $616 in production expenses. That left a 2½% return on the $4,274 investment--and he threw in his labor free.

Also added to the 2 acres in order for it to produce are 31 gallons of fuel and 174 kilowatts of electricity. The total 4.5 acre per person share also has one-sixth interest in a beef cow and one-twentieth interest in a dairy cow.

The farmer is so efficient that he can make these 4.5 acres produce about twice as much wheat and rice as Americans eat, about 40 percent more cotton and soybeans than they can use, and a fourth more feed grains than it takes to feed the livestock and poultry.

Exports take much of the surplus and help justify production levels high enough to take advantage of efficiency, which in turn helps keep consumer prices down. Farm exports also make jobs for over a million non-farm people in the U.S. We now export about $26 billion more farm products than we import each year. This favorable balance of trade helps finance the import of other needed items like fuel and minerals.

How well Americans and their children eat in years ahead depends on the farmer who tends the 4.5 acres that grow their food and fiber.

(Excerpt from the ASCS Farm News.)

STATISTICS BULLETIN AVAILABLE

Montana Agricultural Statistics, 1983, with county data for 1981 and 1982 is now available upon request. The bulletin is a comprehensive tabulation of crop and livestock data, farm income, farm prices, cash receipts, land use, climatological and other farm and ranch data. Free copies may be obtained by writing:

*featuring. . . . .*BLAINE COUNTY

Blaine County was created in March of 1912 and occupies 2,733,440 acres in the north central region of Montana. Its northern boundary comprises a portion of the Montana-Canada border. Half of its southern boundary is marked by the Missouri River, and the Milk River meanders the entire width of the county. The land in Blaine County is generally level, being broken in the western and southern regions by the Bear Paw Mountains. The Fort Belknap Indian Reservation occupies the southeastern corner of the county.

Primary crops raised in the county include wheat, oats and barley. Blaine county ranked 9th in 1982 for all wheat production (8th for winter wheat production and 13th in spring wheat production), also 9th in oats production and 15th in barley production. In 1982 livestock numbers, Blaine County ranked 6th in the cattle inventory, 15th for sheep, and 16th in the hog inventory.

Livestock and livestock products brought in $12,826,000 in cash receipts in 1981 with a rank of 21st. Crops contributed $23,380,000 for a place of 15th in the county rankings. Government payments totaled $2,159,000 for a cash receipt total of $38,365,000 in 1981.

OCTOBER GRAIN STOCKS
SLAUGHTER DECREASES
MORE MILK IN MONTANA
'SUPER FARMS'

LIVESTOCK PRICE OUTLOOK UNCERTAIN

The good news is economic conditions have improved dramatically over a year ago--paving the way for more meat purchases. The bad news is record large meat supplies this fall and winter will hold down meat price gains. Increased supplies of meat have been expected since early summer, but summer drought is further boosting the fall and winter volume, and raising uncertainties about future supplies.

This summer total red meat and poultry volume rose 5 percent above a year ago. Pork went 13 percent higher while beef increased 4 percent. Increased deathloss and lighter marketing weights led to a 1 percent decline in broiler output.

Red meat supplies should remain large through winter because of expansion plans made in 1982 and early 1983--this in spite of drought, acreage reduction programs and resulting higher grain prices. In fact, even higher grain prices, or the failure of recent rains to generate favorable fall and winter grazing conditions could send more livestock to market, further expanding red meat supplies. Total red meat and poultry production is likely to exceed year ago levels by 4 percent this fall and 3 percent his winter. Sharpest year-to-year gains will continue to occur in the pork sector, where production is expected to rise 13 percent over a year ago this fall and 8 percent this winter.

Next spring, however, total red meat and poultry production is expected to slip about 2 percent from spring 1983 levels, reflecting producers reactions to higher grain prices and weak live animal prices through winter. Prices for all meats should average above a year earlier starting in the spring of 1984 and carrying through the rest of that year as production begins to fall.

MONTANA WHEAT STOCKS SMALLER

Wheat in all Montana storage positions totaled 201.6 million bushels as of October 1--down 15 percent from last year's record holdings. The smaller stocks relfects a smaller 1983 harvest and the largest June-September disappearance since 1978.

Winter wheat stored in the State at 114.2 million bushels was 6 percent above last year. All spring wheat was down 33 percent at 87.4 million bushels largely due to a 46 percent reduction in 1983 production. The durum portion at 9.9 million bushels was down 44 percent from last year.

Barley stocks in all positions at 66.5 million bushels were 2 percent below last year. Oats stocks at 8.0 million bushels were down 6 percent.

NATION'S WHEAT STOCKS DIP ONLY SLIGHTLY

Nationally, all wheat stored in all positions on October 1, 1983 totaled 2.95 billion bushels, 1 percent below the 2.99 billion bushels on hand a year earlier. Farm stocks of 1.24 billion bushels accounted for 42 percent of the total. Wheat stored off-farms totaled 1.71 billion bushels. Indicated disappearance of all wheat during the June-September period totaled 998 million bushels compared with 986 million bushels during the same period a year ago.

Durum wheat stocks in all positions October 1, 1983 totaled 170 million bushels, down 22 percent from last year's 218 million bushels. Farm stocks accounted for 73 percent of the total, or 124 million bushels.

Barley stored in all positions on October 1, 1983 totaled 525 million bushels, 5 percent more than a year ago and 16 percent greater than on the same date in 1981. Of the total barley stocks on hand October 1, 1983, 67 percent of 351 million bushels were stored on farms. Farm stocks were 1 percent below a year ago. Off-farm stocks, at 174 million bushels, were up 17 percent from last year's level.

Old crop corn in all positions on October 1, 1983 totaled a record high 3.14 billion bushels, 37 percent above last year's level of 2.29 billion bushels.

PROFILE OF THE SUPER FARMS

They are called the top farms, the super farms, and sometimes--with a tone of disapproval--the 'corporation' farms. Whatever the label, more farms than ever have entered the $500,000 sales class, and these farms are playing an increasingly important and controversial role in U.S. agriculture.

In 1969, only one in every thousand U.S. farms rang up $500,000 or more in sales of agricultural products. Today, the $500K farms number about one in every hundred. These farms encompass about 8 percent of all U.S. farmland, turn out more than a fourth of the total value of U.S. farm production, and reap an astonishing three-fifths of U.S. net farm income. They also generate two conflicting stereotypes.

On one hand, the Nation's sales giants are extolled as international models of successful, large-scale agriculture. On the other hand, these farms are often stereotyped as huge corporate subsidiaries that feed on the federal treasury.

These farms come in all sizes, from less than a hundred acres to several thousand. They include fruit, vegetable, cotton, and grain farms, as well as dairy, poultry and hog farms, cattle ranches, feedlots and many other types of operations. They vary in location and type of ownership. Nevertheless, it's true that these farms are heavily concentrated in certain commodities and geographic areas. Based solely on their numbers, they do receive a disproportionate share of farm program payments. In many cases, they also fly the corporate banner, but that doesn't necessarily mean that any ownership shares are held outside the farm operator family.

FARMS IN THE $500,000 SALES CLASS DOMINATE SOME PRODUCT MARKETS

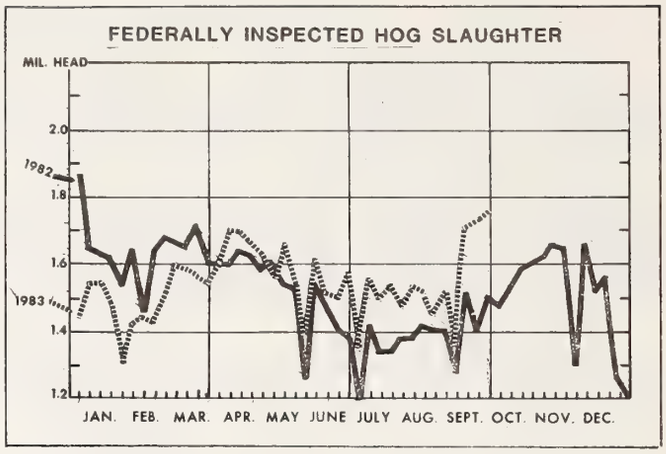
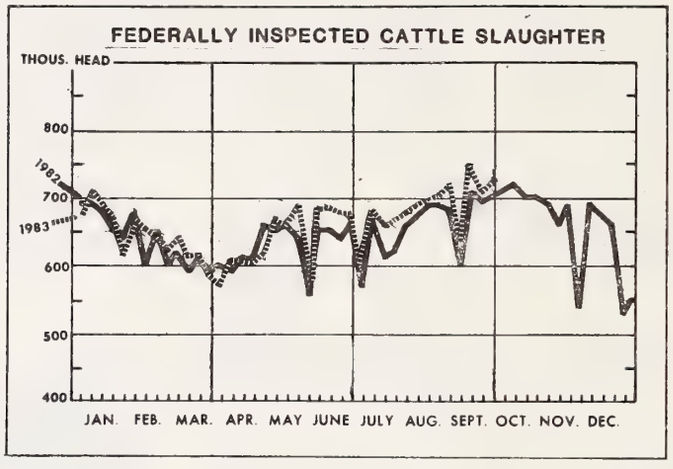
MONTANA RED MEAT PRODUCTION DOWN

Commercial red meat production in Montana during September at 12.1 million pounds was 2 percent below August. The January-September accumulated total was 100.8 million pounds, 14 percent above the same period last year.

There were 10,200 head of cattle slaughtered and 37,400 head of hogs killed during September.

Nationally, commercial red meat production in the United States for September 1983 totaled 3.44 billion pounds. The 1983 January-September accumulated red meat production, at 28.5 billion pounds, was up 3 percent from the comparable period in 1982. January-September red meat production changes from a year earlier by individual components were: Beef, up 3 percent; veal, down 1 percent; pork, up 4 percent; lamb and mutton, up 5 percent. Commercial red meat production includes slaughter in Federally inspected slaughter and other plants, but excludes animals slaughtered on farms. Kill days for September included 22 weekdays (1 Holiday) and 4 Saturdays.





MONTANA'S MILK PRODUCTION UP

Montana's dairy herd produced 91 million pounds of milk for the July-September quarter, up 3 percent from last year.

The number of milk cows, at 29,000, is the same as last quarter and last year.

Nationally, milk production for the July-September quarter totaled 34.8 billion pounds, 3 percent more than the same period in 1982. Accumulated milk production during the first nine months of 1983 totaled 105 billion pounds, up 2 percent from last year, and 4 percent above 1981. Grain and concentrates fed on October 1 averaged 15.4 pounds and the value of the grain fed averaged $8.30/cwt.

CROP PRODUCTION FORECAST

featuring.....POWDER RIVER COUNTY

NATIONS FEED GRAIN PROSPECTS WEAKEN

Continued severe drought further lowered the corn production estimates for October 1. The forecast at 4.26 billion bushels is down 3 percent from September and 49 percent below last year.

Total feed grain production for the nation (corn, sorghum, oats, and barley combined) is expected to total 5.7 billion bushels, down 46 percent from last year.

Food grain production (wheat, rye, and rice) is expected to total 2.5 billion bushels, down 16 percent from 1982.

OCTOBER 1 CROP FORECAST

Montana's wheat production forecast for October 1 is down 27 percent from last year's record. The forecast is down slightly from the September 1 estimate because of reduced yield prospects for durum. In spite of below normal rainfall for most of the eastern third of the state, the expected all wheat yield at 31.0 bushels per acre is only 3.2 below last year's record.

Barley production is up 6 percent from last year's record. Yield at 45.0 bushels per acre is 1 bushel less than the August 1 forecast.

Oats production is down 8 percent from last year. Yield prospects are 2 bushels below the August 1 forecast.

Hay production in Montana is down 8 percent from a year ago--cut from 3 percent fewer acres and an 5 percent smaller yield.

PASTURE and RANGE CONDITIONS OCTOBER 1

In western Montana, pastures and ranges were generally in excellent condition but in much of the eastern sections condition was reported to be poor. In most of the central area and the southeastern corner range and pasture condition was fair.

Lack of rainfall and shortage of forage has accelerated cattle and sheep movement from summer ranges.

FARM PRICES

Prices received by Montana farmers in mid-September were slightly higher than in August. Price increases were reported for spring wheat, barley, hay and milk while prices declined for winter wheat, durum wheat, oats and most livestock items. Compared with last year's prices, all of the crop items showed increases except for oats which was unchanged from a year ago. All prices for livestock and livestock products were down from last year except for milk and eggs.

The September index of prices received for all farm products was 142 (1977=100), up 1 point from August but down 5 points from last year. Compared with last year, the all crops index was up 13 points, while the livestock and products index was down 23 points.

Nationally, the September all farm products index of prices received by farmers decreased 2 points (1.4 percent) from August to 137 percent of its January-December 1977 average. Contributing most to the decrease since August were lower prices for oranges, cattle, hogs, and potatoes. Higher prices for soybeans, lettuce and apples were partially offsetting. The index was 1 point (.7 percent) above a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes, and farm wage rates for September was 161 percent of its 1977 base. The index increased one point (.6 percent) from August as higher feed prices were partially offset by lower prices for feeder cattle and pigs. The index for September was 2.5 percent (4 points) higher than a year earlier.

featuring . . . . . POWDER RIVER COUNTY

Powder River County is situated in the extreme southeastern part of Montana, with the county's southern boundary making up part of the Montana-Wyoming border. The northern and eastern districts of the county are largely composed of rolling prairie. The Powder and Little Powder Rivers traverse the eastern half of the county from north to south. A good portion of the western half of the county is occupied by a section of the Custer National Forest.

Livestock raising is the primary agricultural industry in the county. The January 1, 1982 cattle and sheep inventories put the county 6th in line in sheep production, and 9th for cattle numbers. The county ranked 35th in the State for hog production on December 1, 1981.

Principle crops grown in Powder River County are winter wheat, oats and alfalfa hay. The county ranked 16th for alfalfa hay, 25th for winter wheat and 26th for oats production in the 1982 crop year.

Livestock and livestock products contributed $13,973,000 which accounted for 65% of the total cash receipts for the county in 1981. Crops turned over $5,690,000 and government payments amounted to $1,707,000 for a total of $21,370,000 in cash receipts for the county in 1981.

The county covers 2,096,640 acres and the county seat is Broadus. The average annual precipitation is 13.84 inches, and the county has an average of 125 frost free days.

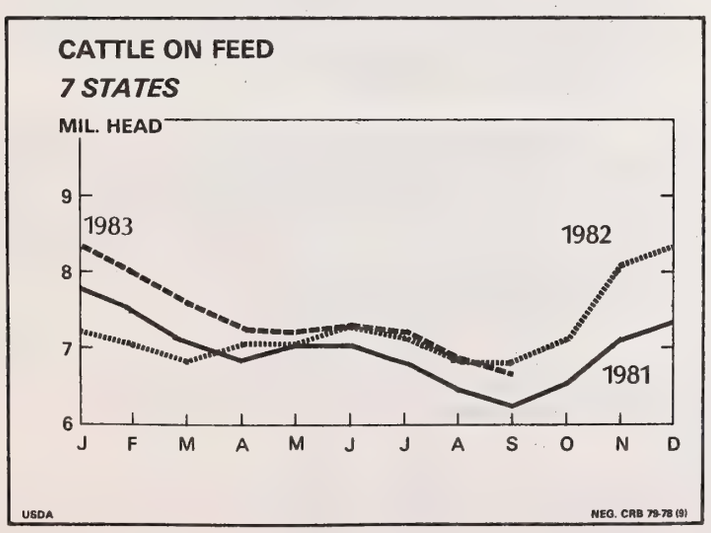
CATTLE ON FEED DOWN

Cattle and calves on feed September 1 for slaughter market in the 7 states preparing monthly estimates totaled 6.69 million head, down 2 percent from a year ago but 6 percent more than September 1, 1981. MARKETINGS of fed cattle during August totaled 1.66 million, 2 percent below last year but 9 percent more than August two years ago. PLACEMENTS of cattle and calves on feed in the 7 states during August totaled 1.57 million, down 10 percent from last year but 10 percent more than the same month in 1981. NET PLACEMENTS of 1.48 million head during August were 12 percent less than last year but 8 percent more than two years ago. OTHER DISAPPEARANCE totaled 89 thousand head compared with 61 thousand during August 1982 and 55 thousand during August 1981.



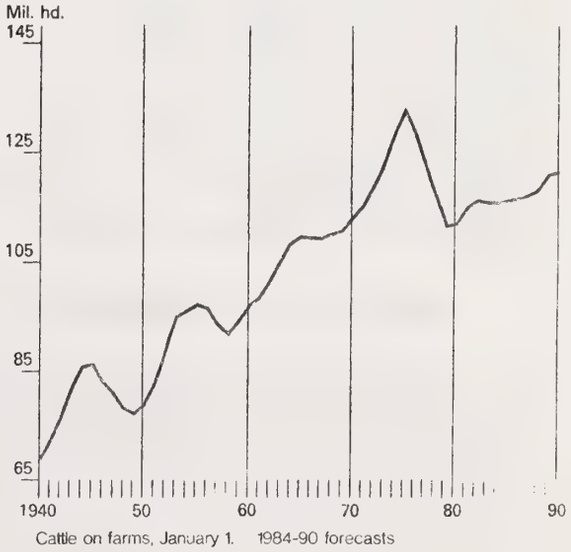
ABERRATIONS IN THE CATTLE CYCLE

Until recently, changes in the cattle inventory have been one of the more reliable cyclical movements in the agricultural economy. However, the present cycle, which began in 1979, has not followed the general pattern of the previous eight recorded since the late 1800's.

The present cattle cycle started with 110.9 million head and rose to 115.6 million by 1982, a fairly typical beginning. But, the cycle began to falter as more cows were slaughtered because of financial difficulties--particularly on crop-livestock enterprises where cattle are supplementary to crops. As a result, the upswing in the cycle halted, and on January 1, 1983 the cattle inventory numbered 115.2 million head, essentially unchanged from a year earlier. Furthermore, the base for future production of beef cattle was reduced; the cow inventory declined 3 percent, while the number of heifers held for herd expansion dropped 4 percent.

Until now, the average cycle length from trough to trough has been 9 to 16 years, with the span gradually shortening. Each cycle peaked in about mid-decade, with the last four peaking in a year ending in 5--1945, 1955, 1965 and 1975--and each at a higher inventory than the previous one.

Last Cattle Cycle May Have Been the Aberration



Cattle on farms, January 1. 1984-90 forecasts

HOG INVENTORY UP CONSIDERABLY

Inventory of all hogs and pigs on September 1, 1983 in the 10 states conducting quarterly hog surveys is estimated at 45.9 million head, 10 percent above last September 1 but 3 percent less than September 1, 1981.

--Breeding inventory, at 5.83 million head, was 5 percent more than a year ago, but 8 percent below two years earlier.

--Market hog inventory, at 40.1 million head, was 11 percent above last year, but 2 percent less than in 1981.

PIG CROP: The June-August 1983 pig crop was 17.7 million head, 9 percent above last year but 3 percent below two years ago. There were 2.40 million sows that farrowed during June-August, an increase of 9 percent from a year ago, but 2 percent below the same period two years ago. Sows farrowing averaged 7.36 pigs per litter compared with 7.39 last year and 7.37 two years ago.

FARROWING INTENTIONS: Hog producers in the 10 quarterly states intend to farrow 2.46 million sows during September-November of this year. This is 4 percent more than during the comparable period in 1982, and 2 percent more than two years ago. Farrowing intentions for December 1983-February 1984 quarter are 2.07 million head, 1 percent below the same period a year earlier but 5 percent above two years earlier.

MONTANA EGG PRODUCTION UP

Montana's laying flocks produced 50 million eggs between June 1 and August 31, 1983. The average number of layers was 775,000 during the quarter. Compared with a year earlier, egg production increased 6 percent while layer numbers showed only a slight increase.

The Nation's laying flocks produced 16,731 million eggs during the same period--down 3 percent from a year ago. The number of layers averaged 268.9 million--down 5 percent.

NEW SURVEY TO UPDATE FARM PRODUCTION COSTS

America's agricultural productivity is the highest of any nation in the world, but it costs U.S. farmers record amounts of money to reach this productivity level. Cost of production data is used by farmers and farm organizations to keep consumers and the U.S. Congress informed, so fair farm policy can be developed. Detailed information that is currently available on the costs of producing crops falls short of what is needed.

During October, enumerators from the Montana Crop and Livestock Reporting Service will interview a cross section of Montana farmers as part of a nationwide program to determine 1983 wheat, oats and barley production costs. The Economic Research Service will analyze this data and make the cost of production estimates. Survey results will be published on a regional and national level.

RED MEAT PRODUCTION UP

Commercial red meat production in Montana during August at 12.4 million pounds was 21 percent above July. The January-August accumulated total was 88.7 million pounds. There were 9,400 head of cattle slaughtered, and 39,200 head of hogs killed during August.

Commercial red meat production in the United States for August 1983 totaled 3.44 billion pounds. January-August accumulated red meat production totaled 25.1 billion pounds. Beef production during August totaled 2.12 billion pounds. Total head killed was 3.37 million and live weight averaged 1,064 pounds per head. Veal production was 39 million pounds. Calf slaughter of 286 thousand head averaged 230 pounds live weight. Pork production totaled 1.25 billion pounds. Hog kill totaled 7.32 million head, with an average live weight of 241 pounds. Lamb and mutton production was 33 million pounds. Head kill of 607 thousand averaged 110 pounds live weight.

WHEAT UTILIZATION

Montana wheat shipped to out-of-state destinations in the 1982 marketing year (June 1982-May 1983) is estimated at 143.7 million bushels--including unaccounted for disappearance. This is about the same as last year. More than 90 percent of total disappearance was shipped to out-of-state destinations.

The amount shipped to the Pacific Northwest was 137.4 million bushels, about 2 percent above last year. Montana wheat shipped overseas from Pacific Northwest ports increased about 4 percent over last year totaling 118.8 million bushels. Montana wheat used for flour in the Pacific Northwest was down 9 percent.

Montana wheat represented 55 percent of the total wheat leaving Pacific Northwest ports in the June 1982-May 1983 marketing period.

Funds for wheat utilization and movement were furnished by the Montana Wheat Commission.

featuring. . . . . JUDITH BASIN COUNTY

Created in December of 1920, Judith Basin County occupies 1,196,160 acres of central Montana. The Judith River traverses the lower portion of the county, and the southwestern corner is blanketed by a section of the Lewis and Clark National Forest. Included in the county's boundaries is the great Judith Basin, recognized as one of the better non-irrigated districts in the State.

Winter wheat, barley, oats and alfalfa hay are the major crops grown in Judith Basin County. Some durum and spring wheat are also grown. The county ranked 15th, 10th and 19th respectively for winter wheat, barley and oats production in 1982 and 26th in spring wheat production. Of the 28 durum wheat producing counties, Judith Basin ranked 15th in 1982.

Crops brought in 47% of the total cash receipts for the county in 1981. That adds up to $15,013,000. Livestock and livestock products made up 49% of the total, or $15,584,000. Government payments contributed the remaining 4% with $1,162,000 for a total cash receipt figure of $31,759,000 for 1981.

In the January 1, 1982 livestock count, Judith Basin County ranked 15th in the state for cattle numbers and 18th in sheep numbers. The December 1, 1981 hog inventory showed Judith Basin ranking 30th in the hog producing counties.

NATION'S CORN CROP DROPS SHARPLY

Severe drought and high temperatures in the Nation's Corn Belt along with heavy participation in USDA's P.I.K. program have sharply reduced grain production prospects. U.S. corn for grain production is forecast at 4.39 billion bushels, down 16 percent from the August 1 forecast and 48 percent below last year's record crop . If realized, this will be the smallest corn crop since 1970.

Although forecast production of most crops is down, supplies should be sufficient to fulfill the Nation's internal and export demands--but, prices will be higher and stocks in storage will be reduced.

MONTANA WHEAT PRODUCTION FORECAST UNCHANGED

Montana's wheat production forecast for September 1, 1983 is down 27 percent from last year's record crop. The forecast is unchanged from August 1. The expected yield for all wheat at 31.0 bushels per acre is 3.2 bushels under last year's record. Acres for harvest are down 19 percent and the lowest since 1975.

Barley production is up 6 percent from last year's record. Yield at 45.0 bushels per acre is 1 bushel less than the August 1 forecast.

Oats production is down 8 percent from last year. Yield prospects are 2 bushels below the August 1 forecast.

Hay production in Montana is down 11 percent from a year ago--cut from 3 percent fewer acres and an 8 percent smaller yield.

September 1 production forecasts are based on producer reports of condition and yield. Actual field observations and measurements are also used in making the wheat production forecast.

NEW U.S.--SOVIET GRAIN PACT

AN AGREEMENT IN PRINCIPLE ON A NEW U.S.-SOVIET GRAIN TRADE PACT was announced on July 28. The 5-year accord would raise minimum Soviet grain purchases by 33%-50%. It should help assure that the U.S. remains a major Soviet grain supplier, and it may even reestablish America's role as the Soviet Union's top grain merchant--a position occupied so far this year by Argentina, with Canada in the number two spot. Since the 1980 U.S. grain embargo, the U.S. share of Soviet grain imports has slid from a high of 70%-80% to an estimated low of around 20% this year.

The pact is scheduled to take effect on October 1, after the current agreement--now in its 7th year--expires. According to a preliminary outline, the Soviets agreed to buy a minimum of 8 million tons of U.S. grain a year, in roughly equal quantities of corn and wheat. In addition, they will buy 1 million tons of either corn or wheat, or 500,000 tons of soybeans or soybean meal. In dollars, the minimum annual purchases represent $1.3-$1.4 billion in U.S. sales at recent export prices. And, if the Soviets want, they may buy as much as 12 million tons of U.S. grain a year without consulting the U.S. government. Beyond that, the U.S. may offer--or the Soviets may request--any additional amount.

The previous agreement, signed in 1975, carried a 6-million-ton grain minimum, with no provision for oilseed sales. It permitted up to 8 million tons in grain purchases without consultations. Until the U.S. embargo, the Soviets took almost any amount the U.S. offered. Not so after the embargo. In fiscal 1982, Soviet purchases of U.S. wheat and corn reached almost 14 million tons, but we had offered 23 million. This year, we again offered up to 23 million tons, but the Russians have bought only around 6 million tons of U.S. grain thus far, and total shipments are unlikely to be much higher. Reasons for this year's reduced sales: signs of a bigger Soviet harvest and, possibly, a Soviet desire to hold onto a strong bargaining position in the trade negotiations with the United States.

"The 1975 agreement was negotiated under far different conditions," says USDA analyst Tom Bickerton. "Then, the Soviets knew they were heading for a crop disaster, and we held most of the supplies. This year, however, they expect a relatively good grain crop, by our estimates the largest harvest in 5 years. Also, they have agreements with other suppliers graranteeing them about 10 million tons of grain a year. In other words, they're in a stronger bargaining position today."

PASTURE & RANGE CONDITION

Pasture and range conditions continued to be varied across Montana as of September 1st. The northeastern portion of the State continued to suffer from a shortage of moisture and reported pastures and ranges in poor condition. The central and southeastern portions of the State were in generally fair condition, but soil moisture continued to be short in these areas as well. Most of western Montana has benefitted from above average precipitation and pastures and ranges here were reported in good to excellent condition.

FARM PRICES

Prices received by Montana farmers in mid-August were slightly higher than in July. Price increases were reported for spring wheat, durum wheat, sheep, hogs, milk and eggs, while prices declined for winter wheat, barley, oats, lambs, cows, calves and steers and heifers. Compared with last year's prices, all of the crop items showed increases except barley and oats. All prices for livestock and livestock products were down from last year except for milk and eggs.

The August index of prices received for all farm products was 144 (1977=100), up 2 points from July but 3 points lower than a year ago. Compared with last year, the all crops index was up 9 points, while the livestock and products index was down 16 points.

Nationally, the August all farm products index of prices received by farmers increased 6 points (4.6 percent) from July to 137 percent of its January-December 1977 average. Contributing most to the increase since July were higher prices for soybeans, corn, hogs, wheat and lettuce. Lower prices for cattle, tomatoes, peaches and calves were partially offsetting. The index was 4 points (3.0 percent) above a year ago.

The index of prices paid by farmers for commodities and services, interest, taxes and farm wage rates for August was 161 percent of its 1977 base. The index increased one point (.6 percent) from July as higher feed prices more than offset lower prices for feeder cattle and calves. Compared to a year earlier, the index was up 4 points (2.5 percent).

FEATURING..... SHERIDAN COUNTY

Sheridan County, lying in the extreme northeastern portion of Montana, claims 1,100,800 acres. Sheridan county is a prairie county and three-fourths of the land is tillable. The soil is of Glacier ongin which provides a rich base for small grain production.

In 1981, Sheridan county was ranked 14th in the state for all cash receipts from farming with $41,592,000. Livestock receipts totaled $4,133,000 and ranked 49th. Crops generated $34,454,000 and ranked 7th in the state. Government payments account for the remaining $3,005,000.

Sheridan County ranks first in durum wheat production. In 1982, 62% of the state's durum wheat was produced in Sheridan County. The county also ranks third in oats production. Livestock is limited with cattle ranking 46th and sheep ranking 41st.

CATTLE ON FEED IN 7 STATES UP 1 PERCENT

Cattle and calves on feed August 1 for slaughter market in the 7 states preparing monthly estimates totaled 6.87 million head, up 1 percent from a year ago and 7 percent above August 1, 1981.

Marketings of fed cattle during July totaled 1.50 million, 1 percent above last year and 6 percent more than July two years ago.

Placements of cattle and calves on feed in the 7 states during July totaled 1.19 million, down 1 percent from last year but 10 percent above July 1981. Net Placements of 1.10 million for July are 4 percent below last year but up 8 percent from two years ago.

Other disappearance totaled 94 thousand head, compared with 68 thousand during July 1982 and 65 thousand during July 1981.

REGIONAL SHIFTS IN WHEAT PRODUCTION

The Plains States raise about 59 percent of the Nation's wheat crop and as a group reduced their production this year by 13 percent. The Southern States had by far the greatest percentage reduction in wheat production, but those states account for only 8 percent of the National total. The Pacific Northwest and the Corn Belt States are both increasing production this year because of yield increases. Those states combined account for 24 percent of the U.S. production.

WHEAT and BARLEY MOVEMENT

Montana wheat shipped to out-of-state destinations in December 1982 through May 1983 totaled 69.0 million bushels, 31 percent above the same period one year ago. Shipments to western destinations amounted to 67.4 million bushels while eastern shipments totaled 1.2 million. Western shipments were up 35 percent while eastern movement was down 48 percent. The amount of wheat moved by rail was up 41 percent compared with the same period last year. Truck movement was off 2 percent.

Montana barley shipped to out-of-state destinations in December 1982 through May 1983 totaled 16.7 million bushels, 9 percent more than in the same period last year. Shipments to western destinations amounted to 13.5 million bushels, and 1.9 million went east. These shipments, compared with last year, are up 5 percent to the west and down 10 percent to the east. Trucks hauled less than half the shipments with 7.2 million bushels. Rail movement accounted for 9.4 million.

MONTANA FARM NUMBERS STABLE

Based on survey data collected in June 1983, the number of farms and ranches in Montana is unchanged from a year earlier and totals 24,000. Land in farms at 62.1 million acres is also unchanged from last year and has remained stable since 1977.

TOTAL MEAT SUPPLIES LARGE, CATTLE INVENTORY UNCHANGED

The July 1 inventory gives continuing evidence of the nearly static state of the cattle cycle. Prospects for large supplies of competing meats, higher grain prices, and lower cattle prices have reduced the incentive for expanding the cattle herd. In spite of a strengthening economy, which should begin to support meat purchases this fall, the near-record meat supplies expected through the winter of 1984, plus higher feed costs, are likely to cause continued losses for meat producers at least until late winter or early spring.

The inventory of cattle and calves on July 1 was down only slightly from a year earlier. However, the breeding herd, the base for future output, points to further modest reductions in 1984. Beef cow numbers were down 1 percent from a year earlier, while the number of heifers being saved for possible herd expansion declined 5 percent. The number of replacement heifers calving and entering the cow herd during the first half of 1983 was the fourth lowest for this period since the midyear inventory began in 1973. This has pushed the 1983 calf crop an estimated 1 percent below the 1982 crop--the third consecutive year of modest declines. However, a larger supply of yearling feeder cattle outside feedlots will likely support feedlot placements and nonfed slaughter through the winter near the large levels of a year ago. A large number of heavy cattle in feedlots on July 1 and increased cow slaughter have raised the forecast for beef production during second-half 1983.

Total red meat and poultry production through first-quarter 1984 is expected to remain 4 to 5 percent above a year earlier. Red meat supplies will rise 5 to 6 percent, with the sharpest gains due to expanding hog inventories. Profitable feeding conditions in 1982 and prospects for lower grain prices encouraged hog producers to expand their breeding inventories. Now faced with prospects for much lower prices and higher feed costs, producers will likely reduce herds, but pork production probably won't fall below a year earlier until late in first-half 1984. Higher grain prices and prospective large supplies of other meats at prices lower than a year earlier will limit poultry output through first-quarter 1984 to a 1 percent rise.

CROP PRODUCTION FORECAST
PASTURE & RANGE
MONTANA WHEAT & BARLEY
VARIETIES -- 1983
AG PRICES

U.S. WHEAT SUPPLIES REMAIN HIGH

Although more than a third of U.S. wheat land has been idled under 1983 acreage reduction programs, total wheat supplies in the 1983/84 marketing year are expected to be only 1 percent under last year's record. This estimate reflects the August 1 production forecast of 2.42 billion bushels, only 14 percent below the record output of 1982, and a record carryover of old crop wheat of 1.54 billion bushels.

The Plains States, which produced 58 percent of the wheat last year are down 13 percent. The Southern States produced 11 percent of the total in 1982, reduced their production 32 percent. The Corn Belt States and the Pacific Northwest have had an increase in production from last year.

CROP HARVEST PROGRESS

Hot weather has hastened maturity of all crops and put stress on spring grain crops. Winter wheat harvest has started in all areas and is most advanced in the drier eastern districts. Harvest was running slightly ahead of normal with about 25 percent of the crop harvested by the end of the first week of August. Normally, only about 15 percent is harvested by this time. Combining of spring wheat, oats and barley was also running slightly ahead of normal. Grasshopper activity was reported as moderate with most farmers hoping harvest will be early enough to avert widespread damage. Rain showers continue to delay haying in many areas.

MONTANA CROP PRODUCTION DECREASES

Montana's wheat crop on August 1 was forecast to be down 27 percent from last year's record and the smallest production since 1980. The expected all wheat yield at 31.0 bushels per acre is 3.2 bushels under last year's record, but only slightly less than the second high yield set in 1975. Acres for harvest are down 19 percent and the lowest since 1973.

Barley production is up 9 percent over last year and would be the largest crop on record. The August 1 yield forecast is down 1 bushel from the July 1 estimate.

Oats production is down 8 percent from last year. Yield prospects declined 3 bushels per acre during July.

Hay production in Montana is down 11 percent from a year ago--cut from 3 percent fewer acres and an 8 percent smaller yield.

August 1 production forecasts are based on producer reports of condition and yield. Actual field observations and measurements are also used in making the wheat production forecast. Production changes from 1982 are:

All Wheat	--	down 27%
Winter Wheat	--	down 1%
Hard Spring Wheat	--	down 46%
Durum	--	down 54%
Barley	--	up 9%
Oats	--	down 8%
All Hay	--	down 11%
Sugarbeets	--	down 3%
Corn for Grain	--	down 14%
Dry Beans	--	down 65%

MONTANA BARLEY VARIETIES 1983

Hector remained the number one choice of barley varieties seeded in Montana in 1983. Hector, a feed barley, was planted on 35 percent of the barley acreage. Piroline occupied the second spot, followed by Klages, both malting type varieties.

Montana growers seeded 41 percent of their barley acres with malting type varieties, down from 48 percent last year.

MONTANA WHEAT VARIETIES 1983

Redwin, an excellent milling and baking quality wheat, was the most widely seeded winter wheat variety in 1983. Winalta, the number one variety for 14 years, fell to second place, while Norstar moved from fourth to third.

Newana replaced Olaf as the number one spring wheat variety. Len moved into second place from ninth, and Olaf fell to third place.

Ward remained the number one durum wheat. Vic was second and Rolette was third.

JULY 1 CATTLE & CALF INVENTORY
RED MEAT PRODUCTION UP
FARM PRODUCTION EXPENDITURES
MORE MILK

NATIONAL CATTLE HERD STABLE

The Nation's cattle and calf inventory on July 1, 1983 totaled 124 million head--only slightly less than last July. The size of the National cattle herd has remained relatively unchanged since 1981, shrinking less than 1 percent during each of the last two years.

Heifers being kept for beef cow replacement are 5 percent under last year, signaling a further decline in the inventory numbers for next year. However, total heifers over 500 pounds are nearly unchanged from a year ago.

Historically, cattle cycles have shown a 7 to 9 year expansion trend before liquidation begins to occur. The expansion phase which began in 1980 lasted only 2 years before numbers began to shrink slightly. If market prices signal cattlement to expand, this downward trend could quickly reverse. Individual state level estimates are not available until January 1.

—They own 3.0% of the inventory.

1/ Figures refer to January 1, 1983

JUNE SLAUGHTER REPORT

Commercial red meat production in the United States for June 1983 totaled 3.28 billion pounds. January-June red meat production, at 18.7 billion pounds, was up 1 percent from the comparable period in 1982. The 1983 January-June red meat production changes from a year earlier by individual components were: beef, up 2 percent; veal, down 2 percent; pork, down slightly; lamb and mutton, up 4 percent. Commercial red meat production includes slaughter in federally inspected and other plants, but excludes animals slaughtered on farms.

Kill days for June included 22 weekdays and 4 Saturdays, the same as June 1982.

BEEF PRODUCTION for June totaled 1.97 billion pounds. Total head killed was 3.13 million and live weight averaged 1,060 pounds per head.

VEAL PRODUCTION was 34 million pounds. Calf slaughter of 232 thousand head averaged 245 pounds live weight.

PORK PRODUCTION during the month totaled 1.25 billion pounds. Hog kill totaled 7.15 million head. Average live weight for the month was 246 pounds.

LAMB and MUTTON PRODUCTION was 29 million pounds. Sheep and lamb kill totaled 525 thousand head averaging 112 pounds live weight.

Commercial red meat production in Montana during June totaled 12.0 million pounds, 28 percent more than in May. The January-June accumulated total at 66.2 million pounds is 5 percent above the same period in 1982. Cattle slaughter in Montana during June totaled 8,900 head. The January-June total was 1 percent above last year. The State's hog kill during June was 38,300 head. For the January-June period the number of hogs killed this year was nearly 2 percent above last year.

CATTLE ON FEED UP 1 PERCENT IN 13 QUARTERLY STATES

Cattle and Calves on feed July 1, 1983 for slaughter market in the 13 states totaled 9.07 million head, 1 percent more than last year and 5 percent more than two years ago.

The cattle on feed inventory included 5.66 million steers and steer calves, up slightly from last year and up 2 percent from 1981. This group represented 62 percent of the total July 1 number on feed compared with 63 percent in 1982. Heifers and heifer calves accounted for 3.38 million, up 2 percent from last year and up 11 percent from 1981.

Placements of cattle and calves on feed during the April-June quarter totaled 5.89 million, 2 percent greater than the same quarter one year ago, and 5 percent above the comparable period in 1981.

Marketings of fed cattle for slaughter during April-June totaled 5.52 million, up 6 percent from the same quarter last year, and 8 percent above the same quarter in 1981.

LARGE PORK SUPPLIES TO PRESSURE MEAT PRICES

Total red meat and poultry supplies in second-half 1983 are expected to remain well above a year ago, largely the result of sharp increases in pork production. The larger pork supplies will have a negative impact on all livestock and poultry prices, with those for pork well below a year earlier. However, an improving economy and increased consumer confidence, along with the July 1 tax cut, will likely moderate the meat price decline. Per capita consumption of pork may increase by more than 2 pounds this fall compared with a year earlier, while poultry consumption will likely remain unchanged and beef consumption could decline by about a pound.

Pork production is expected to rise about 10 percent this summer, near earlier expectations. However, a much larger breeding inventory and a record-large number of pigs saved per litter this spring will push this fall's pork production up 17 percent from this summer and 15 percent from fall 1982.

Prices for barrows and gilts are expected to average $46 to $49 per cwt this summer. This is near the spring average, but well below the $62 recorded last summer or this past winter's $55. Prices this fall should drop even more, averaging only $38 to $42 per cwt. Expectations of low hog prices, high feed costs, and thus poor returns could result in herd reductions later this summer and fall.

Production of beef and poultry in the second half of the year is expected to be up only modestly from a year earlier. The largest beef supplies will likely occur during late summer through early fall, as the large May-June feedlot placements of cattle off the wheat grazeout acreage are marketed.

MILK PRODUCTION INCREASES

The Nation's dairy herds produced 36.5 billion pounds of milk during the April-June quarter of 1983--2 percent more than the same period last year. The number of cows on hand averaged 11.1 million, up less than 1 percent.

Accumulated milk production during the first 6 months of 1983 totaled 70.4 billion pounds, up 2 percent from the same period in 1982, and 4 percent above the 1981 period.

MONTANA MILK OUTPUT UP

Montana's dairy herds produced 92 million pounds of milk during the April-June quarter, 7 percent above a year ago for the same period. Cow numbers, at 29,000 were up nearly 4 percent from last year.

NATION'S FOOD and FEED GRAIN ACRES LOWEST SINCE 1972

The Nation's farmers, responding to government acreage control programs, planted 16 percent fewer acres to feed grains and 12 percent less to food grains than last year. The acreage intended for harvest as grain is down 24 percent for feed grains and 22 percent for all food grains, reflecting program compliance requirements. Oilseed crops seeded acreage is 15 percent less than planted in 1982.

U.S. HIGHLIGHTS

Corn plantings down 27%, harvested acres for grain down 28%.

Sorghum plantings down 28%, harvested acres for grain down 29%.

Oats plantings up 42%, harvested acres for grain down 14%.

Barley plantings up 9%, harvested acres for grain up 9%.

All Wheat plantings down 12%, harvested acres down 22%.

Soybeans plantings down 12%, harvested acres down 12%.

All Hay harvested acres down 1%.

Sugarbeets plantings up 1%, harvested acres up 2%.

Dry Edible Beans plantings down 38%, harvested acres down 35%.

MONTANA CROP ACRES DOWN SHARPLY

Montana producers expect to harvest more acres of winter wheat and barley than last year, but fewer acres of most other crops. Total wheat acreage for harvest in Montana is estimated at 4.3 million acres--down 19 percent from 1982 and the smallest acreage for harvest since 1973. Winter wheat for harvest is up 8 percent. Spring wheat acres for harvest are down 36 percent, and durum wheat is down 40 percent.

Barley acreage for harvest is up 19 percent and would be the largest acreage for harvest since 1973. Oats acres are unchanged while all hay acres for harvest are down 3 percent.

JULY 1 CROP PRODUCTION FORECAST

Montana farmers are expecting to harvest 1 percent fewer bushels of winter wheat than last year. Yield per acre is forecast at 35 bushels, 3 bushels under last year, while acres for harvest are up 8 percent.

The Barley production forecast is up 11 percent from last year and would be the largest crop on record.

Oats production is expected to be down 2 percent from a year ago because of a 1 bushel per acre decline in yield.

Montana's sweet cherry crop is down 56 percent from last year because cool weather during bloom resulted in poor pollination.

The first production forecast for spring wheat and durum will be released August 11.

MINK PRODUCTION

Mink pelt production in the United States in 1982 totaled 4.08 million pelts. There was no survey made for 1981 production. Wisconsin, the major mink state, produced 1.16 million pelts.

By color class, the number of pelts as a percent of the total U.S. production was: Standard - 32.5 percent; Ranch Wild - 10.1 percent; Demi-Buff - 18.0 percent; Pastel - 15.9 percent; Pearl - 6.8 percent; and Violet - 4.9 percent. The remaining color classes account for 11.8 percent.

Mink pelts sold during the 1982 crop year were valued at 119.9 million dollars. The average price per pelt for the 1982 crop year was $29.40, compared with an average price of $32.20 in 1981 and $35.30 in 1980.

There were 1,154 mink farms producing pelts in 1982. Leading states were Wisconsin with 262 farms, Utah with 175, and Minnesota with 144 farms.

FARM PRICES LOWER

Prices received by Montana farmers during June were lower for wheat, oats, beef cattle, calves, hogs and milk. Only barley, lambs and eggs increased in price during the month. However, compared with a year earlier wheat, hay, beef cattle, calves, milk and eggs are higher in price. Barley, oats, lambs and hogs are lower priced this June compared to a year ago. Price changes from last year are mostly small, except for hogs.

PASTURE & RANGE CONDITION VARIES

Pastures and ranges in all of western Montana and in most of the southern counties are in good condition. In the central and northern parts of the state ranges are rated poor to fair. Unseasonably cool weather and lack of general rains stunted grass growth in much of the state during May and June.

FEATURING..... JEFFERSON COUNTY

Created in February of 1865, Jefferson County is one of the original counties of the Territory of Montana. With a land area of 1,047,680 acres it has within its boundaries parts of the Deer Lodge and Helena National Forests. The Boulder River traverses the county from west to east.

In 1981 all cash receipts from farming in Jefferson County totaled $5,115,000. That figure brought the county a ranking of 52nd. Livestock receipts were $3,631,000 and also ranked 52nd, while crops brought in $1,371,000 and ranked 49th. Government payments made up the rest of the total with $113,000.

Jefferson County ranked 44th for both cattle and hog numbers in 1981, and 49th in the state for number of sheep. The county ranked 32nd for hay production and 36th in winter wheat production in 1981. Some barley and oats are also grown.

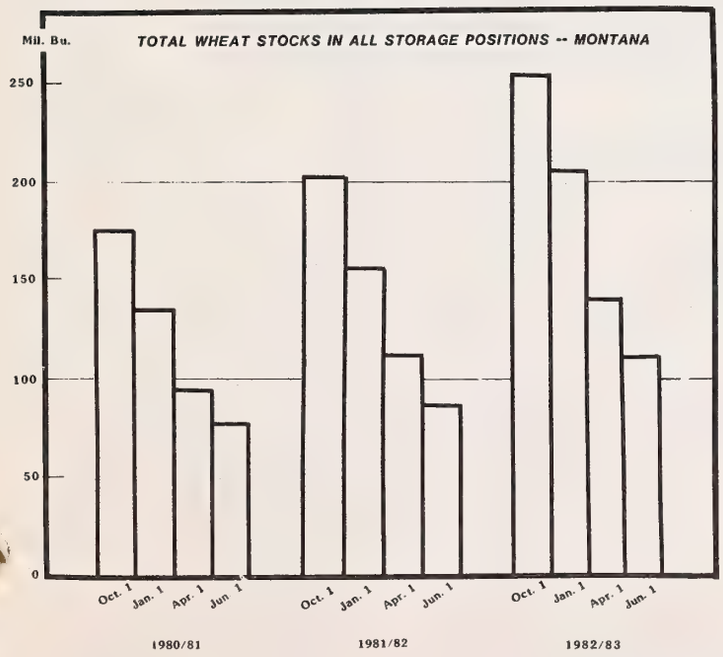
NATIONAL WHEAT STORAGE BIN BULGES

Old crop wheat in all storage positions on June 1, 1983 totaled a record high 1.54 billion bushels, 32 percent greater than the 1.16 billion bushels on hand a year earlier, and 56 percent more than 2 years ago. Farm stocks accounted for 45 percent of the total compared with 50 percent last year.

Disappearance of all wheat during the April-May quarter at 336 million bushels compares with 393 million bushels a year ago. For the June 1982-May 1983 marketing year disappearance totaled 2.43 billion bushels, 7 percent less than last year.

Of the total wheat in storage, 1.24 billion bushels were under government control of which 1.06 billion were in the farmer-owned reserve.

Durum stocks totaled a record high 142 million bushels, up 32 percent. Barley stocks reached 223 million bushels, 49 percent more than last year. Oats in storage on June 1 totaled 229 million bushels, up 51 percent from a year ago.



MONTANA STOCKS RECORD HIGH

Wheat stored on Montana farms and in mills and elevators June 1, 1983 totaled a record high 113.6 million bushels--29 percent more than a year ago. On farm storages on June 1 held a record high 93.6 million bushels or 82 percent of the total wheat stocks.

Winter wheat stored in the state at 49.1 million bushels was up 12 percent from last year. All spring wheat at 64.6 million bushels was up 45 percent. The durum portion at 14.5 million bushels was 78 percent above last year. Barley stocks in all positions at 19.6 million bushels were over 3 times larger than last year and the largest amount on hand June 1 since June 1, 1979. Oats in storage at 3.6 million bushels were almost double those on hand June 1, 1982.

MONTANA EGG PRODUCTION INCREASES

Montana's laying flocks produced 48 million eggs between March 1 and May 31, 1983. The average number of layers during the quarter was 798,000. Compared with a year earlier, egg production increased 7 percent and the number of layers increased 6 percent.

The Nation's laying flock produced 17.2 billion eggs during the same quarter, 2 percent less than a year ago. The total number of layers for the quarter averaged 275 million, 4 percent below last year.

U.S. HOG INVENTORY INCREASES

The U.S. hog inventory on June 1, 1983 at 57.5 million head is up 11 percent from last year's relatively low level, but 4 percent under 2 years ago.

The breeding herd is up 9 percent from last year but still 3 percent under 2 years ago. These estimates indicate that about 2.5 million gilts were added to the U.S. breeding herd during the December 1982-May 1983 period, the largest gilt retention for this period since 1979. December-May sow slaughter at 1.9 million was 15 percent below the comparable period in 1982.

The U.S. market hog inventory was up 11 percent with the largest increase in the under 60 pound weight group which shows a 15 percent gain. A larger than normal ratio of December-May pig crop to June 1 market hogs indicates favorable weight gains and shorter finishing time. Death losses continued a lower than normal trend.

The U.S. pig crop during the December-May period was 14 percent above a year ago. This reflects an 11 percent increase in sows farrowed and a record high December-May litter rate of 7.53 pigs per litter.

The U.S. intentions to farrow for the June-November period is 9 percent above a year ago. This suggests continued expansion but at a slower rate.

RED MEAT PRODUCTION UP

Commercial red meat production in the United States for May 1983 was 3.15 billion pounds, up 4 percent from April. The January-May accumulated red meat production totaled 15.4 billion pounds. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms. Kill days for May included 22 weekdays (1 holiday) and 4 Saturdays.

Beef production during May totaled 1.86 billion pounds, up 8 percent from April. Total head killed was 2.96 million and liveweight averaged 1,065 pounds per head. Veal production was 32 million pounds, unchanged from April. Calf slaughter of 214 thousand head averaged 254 pounds live weight. Pork production totaled 1.23 billion pounds, a 2 percent decrease from a month earlier. Hog kill totaled 7.03 million head. Average live weight for the month was 245 pounds. Lamb and mutton production was 30 million pounds, up 4 percent from April. Head kill of 527 thousand averaged 113 pounds live weight.

Commercial red meat production in Montana during May at 9.4 million pounds was 4 percent under April. The January-May accumulated total was 54.1 million pounds.

There were 6,500 head of cattle slaughtered, and 31,900 head of hogs killed during May. Sheep and lambs slaughtered totaled 200 head.

CHERRY PRODUCTION

This year's cherry crop in Montana is forecast at 1,500 tons, less than half of last year's record high production. Bloom was heavy, but cool, damp weather limited bee activity and pollination was poor in most orchards.

Sweet cherry production in the six western states is expected to total 128 thousand tons, 6 percent more than last year and virtually the same as 1981.

WINTER WHEAT PRODUCTION DECREASES

The Nation's winter wheat crop is forecast to be 11 percent less than last year's record high. The Plains states, with 54 percent of U.S. production, are down 10 percent. The three Pacific Northwest states show a 3 percent increase, and the Corn Belt states are up 5 percent. The Southern states have the sharpest decrease at 29 percent. These states produce mostly soft red winter wheat and now account for 11 percent of the national total compared with 13 percent last year. In 1980, these states had only 7 percent of the total.

Montana's winter wheat crop is down only 1 percent from last year.

PASTURE and RANGE CONDITION

Montana's pastures and ranges were in generally good condition on June 1, but soil moisture was becoming short in many areas by the end of May. Growth of range grass was slow as more moisture is needed for optimum growth. Livestock producers in the drier areas were concerned about stockwater supplies if moisture is not received to replenish stockwater dams and reservoirs.

As of the end of May about 60 percent of the cattle and sheep had been moved to summer ranges. Normally, about 75 percent are moved by this time.

FEATURING..... FLATHEAD COUNTY

Flathead County lies in the extreme northwestern portion of Montana. It was created in February of 1893 and has a land area of 3,388,160 acres. Major portions of the Flathead National Forest lie within the boundaries of the county. The northeastern corner of Flathead County is occupied by 577 majestic square miles of Glacier National Park. Several of Montana's beautiful lakes are also within the boundaries of Flathead County. The northern half of Flathead Lake, famous for the cherry orchards that line its shore, is one of those lakes. Timber is the county's biggest natural resource.

In 1981, Flathead County ranked 35th in the state for all cash receipts from farming with $19,162,000. The breakdown of this total shows that livestock and livestock products brought in $7,697,000, and crops generated $11,089,000 for rankings of 38th and 26th respectively. Government payments account for the remaining $376,000.

In 1981 crop production Flathead County ranked 11th in barley and 19th in all hay production. Other crops grown are wheat and oats. The county ranks high in fruit production with apples, cherries, plums and berries being profitable crops. On the livestock side, Flathead County ranked 9th in hog numbers in 1980. Some cattle and sheep are also raised.

Kalispell is the county seat, and this area has an average annual precipitation of 16.24 inches and 114 frost-free days.

FOREIGN WHEAT PRODUCTION PROSPECTS HIGH

Early prospects indicate that foreign wheat production may reach a record high in 1983. Mild winter weather benefited fall-sown wheat over most of the Northern Hemisphere except for USSR. Area planted to winter wheat rose in many countries.

Growing conditions have been nearly ideal for the European Community's winter grains. Wheat seedings rose last fall, and moisture supplies have been unusually good through the winter and spring.

In Eastern Europe, winter wheat output may not match 1982's exceptional harvest. Fall sowing increased slightly in all countries except Poland, but emergence and tillering began slowly because of dry soil conditions.

Excellent prospects are seen for China's winter wheat. Area expanded 4 percent because of government policy to encourage grain production. Plentiful rains during the late summer and early fall encouraged plantings and increased irrigation water supplies.

India's wheat production is estimated up again this year. Government price supports make wheat a profitable crop, and area is expanding. Larger area under irrigation and greater use of fertilizer will aid yields.

In the USSR, winter wheat area is down sharply, and the crop developed poorly last fall before entering dormancy because of below-normal precipitation. Winterkill is not expected to be above average, despite earlier concerns about warm temperatures and lack of snow cover.

HEAVY PROGRAM PARTICIPATION WILL CUT 1983 U.S. WHEAT CROP

Harvesting of the 1983 wheat crop is underway, with growers expected to combine the smallest acreage in 4 years, a result of Government efforts to reduce U.S. wheat supplies. Wheat production has ballooned to record heights in each of the last three harvests, burdening the industry with excessively large stocks.

Initially, winter wheat seeding was down 3.4 million acres from 1982/83, but enrollment in the payment-in-kind (PIK) program, announced after planting, idled additional cropland, leaving an expected 47 million acres to be harvested, 11 million less than last year. Higher yields will offset some of the acreage reduction, but as of May 1, 1983, winter wheat production was forecast at 1.9 billion bushels, 215 million below 1982's record. In addition, heavy program participation by spring wheat growers will decrease their 1983 plantings about a third, which will mean a sharp cutback from last year's record crop of 700 million bushels.

Despite the reduced harvest, the total supply will be only fractionally smaller than 1982/83's record because of a large carryin. Early prospects for demand are limited, with exports expected to be down from 1982/83 and only a slight increase in domestic use. Because total wheat use will about match 1983's production, yearend stocks on May 31, 1984, will remain record high. However, 'free' (readily marketable) stocks will increase substantially because nearly half of the stocks isolated in the farmer-owned reserve will be used for PIK. Under these conditions, the average farm price may be only slightly better than 1982/83's $3.53 a bushel, within a range from $3.50 to $3.75.

FARM INCOME STAGNANT

The U.S. economy appears to be in the early stages of a modest recovery. The outlook for 1983 farm income, although improved since the advent of the PIK program, still remains uncertain. Cash receipts from the sale of crops will likely be down 10-15 percent while livestock receipts could increase slightly. Shoring up farm income this year will be government payments, both cash and in-kind. These payments will add nearly $10 billion to cash farm income and represent about 45 percent of the total realized net.

Net farm income has been close to $20 billion for the past two years.

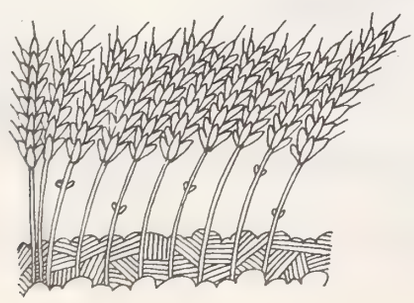
LIVESTOCK HIGHLIGHTS

In addition to the rise in feed costs, recent heavy rains have caused major problems for many cattle feeders. Weight gains are down, but marketings have been kept current. On the other hand, good gains by feeder cattle on wheat over the winter and use of PIK-diverted winter wheat acreage as pasture early this spring have tended to delay the movement of feeders to feedlots or to other pastures. This increases the likelihood of bunched marketings later this summer and fall.

Thus, prices for feeder cattle could decline during the spring and the second half of the year, especially for the heavier-weight feeders. At the moment, cattle feeders are unable to lock in a profit in the futures market because prices are too low in the later contract months.

Meanwhile, more hogs are coming to market, and prices have slipped. Hog slaughter will be up 4 to 5 percent for the remainder of the year, reflecting producers' response to the improved profits of 1982. However, last year's profits will not be sustained this year, as higher feed costs and larger supplies of pork, beef, and broilers are pressuring hog prices below last year's levels. Although hog prices could rise seasonally this summer, they will head lower again in the fall. Any squeeze on returns will lead to reduced output in 1984.

1983 estimates of wheat and barley acreage, yield and production by county are now available. If interested, request a copy from our office.



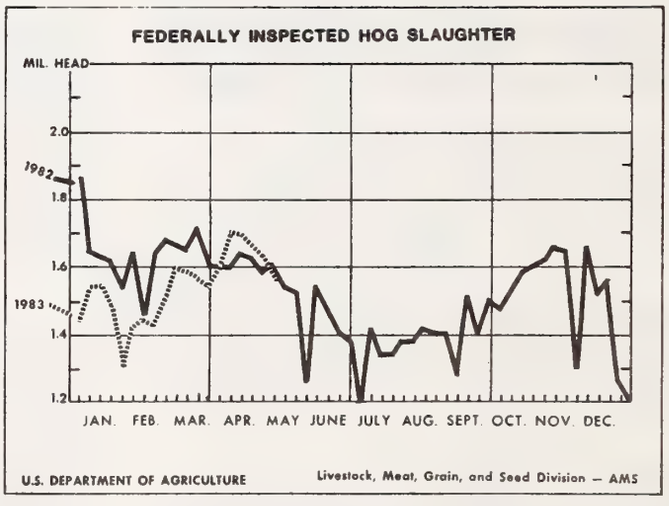
MONTANA MEAT PRODUCTION FALLS

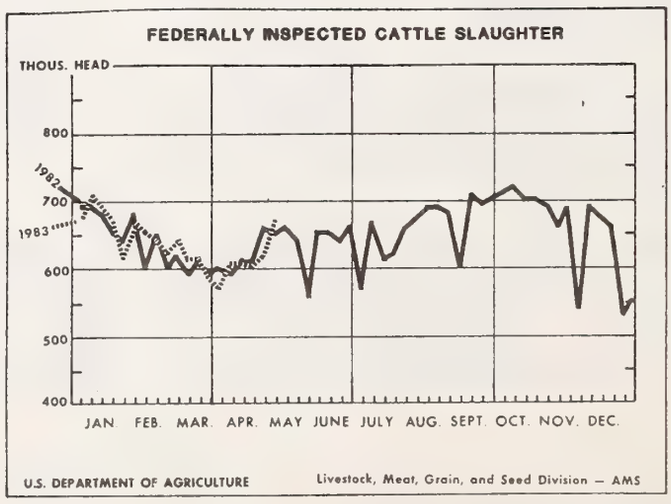
Commercial red meat production in the United States for April 1983 totaled 3.04 billion pounds. January-April accumulated red meat production totaled 12.2 billion pounds. Commercial red meat production includes slaughter in Federally Inspected and other plants, but excludes animals slaughtered on farms. Kill days for April included 21 weekdays and 5 Saturdays.

Beef production during April totaled 1.73 billion pounds. Total head killed was 2.76 million and live weight averaged 1,068 pounds per head. Veal production was 32 million pounds. Calf slaughter of 224 thousand head averaged 244 pounds live weight. Pork production totaled 1.25 billion pounds. Hog kill totaled 7.22 million head. Average live weight for the month was 234 pounds. Lamb and mutton production was 30 million pounds. Head kill of 523 thousand averaged 115 pounds live weight.

Commercial red meat production in Montana during April at 9.8 million pounds was 14 percent below March. The January-April accumulated total was 44.8 million pounds.

There were 4,300 head of cattle slaughtered, and 39,200 head of hogs killed during April in Montana. Sheep and lambs slaughtered totaled 200 head.





CROP WEATHER SUMMARY

FOR WEEK ENDING: MAY 21, 1983

FIELD CROPS: Warm days are badly needed to restore vigor and normal growth to crops. Even winter wheat is showing stress to cold, and some fields have been damaged by recent snows and frost. However, the crop is still reported in generally good condition. Both topsoil and subsoil moisture are adequate in most locations, but dry areas are developing in the southwest part of the state and localized areas elsewhere.

Spring wheat is about 60 percent emerged compared with 45 percent last year and a normal of 55 percent. Barley is about 65 percent up compared with 45 percent last year and a normal of 55 percent. Some sugarbeet fields need replanting because of frost kill and soil crusting.

CROP	PERCENT PLANTED		
	Week Ending May 21	Last Year Same Week	Normal For This Date
SW	90	75	75
Barley	90	80	75
Oats	80	65	70
Corn	60	55	50
Sugarbeets	85	100	90
Dry Beans	40	55	50
Potatoes	40	55	45

LIVESTOCK: About 45 percent of the cattle and sheep have been moved to summer pastures. Range grass growth is slow due to cold weather and many livestock are still being fed hay.

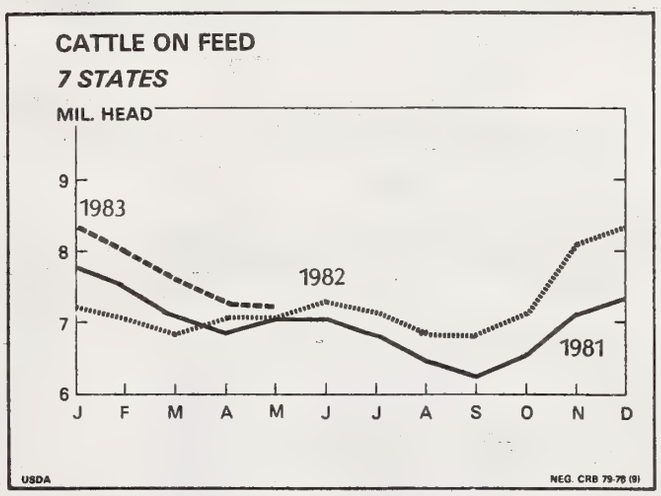
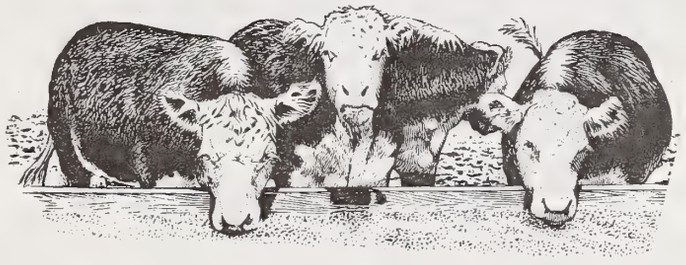
CATTLE ON FEED IN 7 STATES UP

Cattle and calves on feed May 1 for slaughter market in the 7 States preparing monthly estimates totaled 7.22 million head, up 2 percent from a year ago and 3 percent more than May 1, 1981.

MARKETINGS of fed cattle during April totaled 1.47 million, a 4 percent increase from last year and 6 percent above April two years ago. PLACEMENTS of cattle and calves on feed in the 7 States during April totaled 1.57 million, virtually the same as last year but down 9 percent from April 1981. NET PLACEMENTS of 1.42 million for April are off 2 percent from last year and off 10 percent from 1981. OTHER DISAPPEARANCE totaled 143 thousand compared with 109 thousand during April 1982 and 142 thousand two years ago.





POTATO STOCKS UP

Potatoes in Montana storages on May 1 totaled 200 thousand cwt, over 6 times more than on the same date last year. May 1 stocks totaled 10 percent of the 1982 production.

In the 15 major fall producing states, there were 52.9 million cwt in storage, about 4 percent more than last year. The May 1 National stocks were 18 percent of the 1982 production.

*FEATURING.....*MUSSELSHELL COUNTY

Receiving its name from the Musselshell River that traverses it from east to west, Musselshell County is located jsut south of the geographical center of Montana. It was created in March of 1911 and has a land area of 1,216,000 acres. The Bull Mountain Range comprises most of the southern portion of the county.

In the agricultural business, Musselshell County ranked 30th in winter wheat production and 31st for all hay production in 1981. Other major crops grown in the county include barley and oats. Musselshell County ranked 14th in the state for 1981 sheep production, and 33rd in cattle production.

Livestock cash receipts brought in $8,876,000 and a ranking of 32nd in the state in 1981; crops brought in $3,791,000 for a ranking of 41st which adds up to $12,667,000 for total cash receipts from marketings in 1981. That figure was a 10% decrease from 1980 and netted the county a ranking of 43rd for total receipts from marketings. All cash receipts for the county amounted to $13,542,000, a ranking of 42nd in the state and a 6% decrease from 1980 all cash receipts.

Musselshell County Claims Roundup, Montana as its county seat. This area has an average annual precipitation of 11.64 inches and an average of 130 frost-free days.

WHEAT PRODUCTION FORECAST

Montana's winter wheat crop is forecast at 75.6 million bushels, 6 percent less than last year's crop. The forecast is based upon farmers reported condition of the crop on May 1 and is subject to change based mainly on weather the remainder of the growing season. Acres for harvest are down 1 percent from last year, but 18 percent below the acres harvested in 1981.

SPRING ACREAGE INTENTIONS

Montana farmers intend to plant 17 percent fewer acres to spring wheat, durum, barley, oats, corn, sugarbeets and dry beans than last year. The intended acres are based on farmer's reports on or about April 25.

SPRING PLANTING INTENTIONS 1/

CROP	MONTANA		UNITED STATES	
	1982	1983	1982	1983
	(000 Acres)		(000 Acres)	
Hard Spring Wheat	2,950	1,900	16,576	11,563
Durum	350	150	4,350	2,825
Barley	1,650	1,950	9,634	10,648

Southeast	6,230	7,200	+16
STATE	80,560	75,600	- 6

PASTURE & RANGE CONDITION

Montana's pastures and ranges were in generally good condition on May 1. Some areas in the north central and southcentral parts of the state were in slightly poorer condition. Topsoil moisture is rated mostly short over the state and pastures and ranges would benefit from a good soaking rain and warmer temperatures.

As of May 1 only about 10 percent of the livestock had been moved to graze on summer ranges.

APRIL FARM PRICES

Montana farm prices in April strengthened considerably from March, especially grain prices, with the exception of oats. Cattle prices were also higher than the previous month. Sheep, lambs and hogs posted price declines.

The Montana index of prices received for all farm products at 161 (1977=100) was up 3 points from March and 9 points above April 1982. The all crop price index at 152 compares with 146 in March and 154 a year ago. The livestock price index at 170 was up 2 points from March and 20 points above last April.

SURVEY TO MEASURE ACREAGES and LIVESTOCK NUMBERS

Heavy enrollment in the regular acreage reduction and Payment-in-Kind (PIK) programs means large cutbacks in 1983 crops. Feed grain production will likely fall to the lowest levels since the mid-1970's, and wheat output could reach a four-year low. Rice and cotton production will also decrease sharply. Cattle numbers on January 1 declined about 400,000 head from a year earlier, abruptly halting the rise in the cattle cycle. Hog producers had expanded their inventories faster than expected, but higher grain prices because of PIK may slow or halt production increases in 1984.

Just how many acres actually went into production this season and how many livestock are on hand? A nationwide survey in late May and early June will develop estimates to guide farmers in their future marketings, and inform commodity buyers, traders and policymakers on what to expect from agriculture this year.

CROP-WEATHER SUMMARY

For Week Ending May 8, 1983:

CROPS: Topsoil moisture was becoming short, putting stress on new seedlings and range grasses. Widespread storms across much of Montana the week ending May 15 significantly altered that situation. Good planting progress was made prior to the storms.

PERCENT PLANTED

Crop	Week Ending May 7	Last Year Same Week	Normal For This Date
Spring Wheat	75	45	50
Barley	75	50	50
Oats	60	35	45
Corn	30	25	25
Sugarbeets	85	80	70
Dry Beans	10	15	15
Potatoes	10	under 10	15

LIVESTOCK: Calving and lambing are both about 90 percent done which is about normal. Shearing is nearly 80 percent complete.

Cattle and sheep movement to summer ranges is slightly behind schedule with nearly 20 percent moved so far.

HAY STOCKS UP

Hay stocks on Montana farms and ranches May 1 totaled 1.4 million tons, up 65 percent from last year on the same date. The May 1 stocks were 31 percent of the hay on hand January 1. Last year's May 1 stocks were only 20 percent of the January 1 level. The May 1 stocks is usually carryover into next year's feeding season. However, cool nights and dry weather during April retarded range grass growth and slowed turnout to summer ranges. Cool weather and storms the first half of May will also necessitate more hay feeding than normal for this late date. Even so, considerably more hay will be carried over this year compared with normal.

Montana farmers intend to harvest 2.4 million acres of all hay in 1983, 4 percent less than a year ago.

MONTANA DAIRY PRODUCTS

Montana dairy plants produced 523,000 pounds of creamed cottage cheese during March--up 6 percent from a year ago. Ice cream production at 173,000 gallons was up 6 percent, while butter made at 176,000 pounds was down 21 percent. American cheese production at 231,000 pounds was up 8 percent from last year.

Featuring.....WIBAUX COUNTY

MARCH LIVESTOCK SLAUGHTER

Commercial red meat production in Montana during March totaled 11.3 million pounds, up 1 percent from a month earlier. The January-March accumulated total at 35.0 million pounds is down 11 percent from the same period a year ago.

Cattle slaughter in Montana packing plants during March was 7,000 head. The January-March total at 25,900 head is down 23 percent from last year.

Hog slaughter was 39,200 head. The January-March total at 112,000 head was down 5 percent.

Commercial red meat production for the United States in March 1983 totaled 3.27 billion pounds. January-March red meat production, at 9.21 billion pounds was down 1 percent from the comparable period in 1982. The 1983 January-March red meat production changes from a year earlier by individual components were: beef, up 1 percent; veal, down 4 percent; pork, down 6 percent; lamb and mutton, up 3 percent. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

POTATO STOCKS UP

Montana potatoes in storage on April 1 totaled 1.22 million cwt, nearly 36 percent more than on the same date last year. Stocks as a percent of production were 63 percent.

In the 15 major fall producing states, there were 84.8 cwt in storage, about 4 percent more than last year. The April 1 stocks as a percent of production were 29 percent.

RECORD HIGH WHEAT STOCKS

Wheat stored on Montana farms and in mills and elevators April 1, 1983 totaled a record 135.6 million bushels--up 13 percent from a year ago, breaking the previous record for April 1 holdings set in 1978.

Wheat disappearance since January 1 was 65.0 million bushels, a 70 percent increase from the same period last year. Farm storage at 115.6 million bushels was up 13 percent and commercial storage at 20.0 million bushels was up 10 percent.

Total winter wheat stored in the state at 55.4 million bushels was down 10 percent from last year. All spring wheat at 80.2 million bushels was up 37 percent. The durum portion at 15.0 million bushels was up 50 percent. Barley stocks totaled 32.8 million bushels--up 105 percent and oats in storage at 4.4 million bushels were up 77 percent.

Nationally, all wheat stocks in all storage positions totaled a record high 1.87 billion bushels--20 percent more than last year. Farm storages held 884 million bushels which was 47 percent of the April 1 wheat stocks.

U.S. durum stocks totaled a record high 164 million bushels--24 percent above last year and barley in storage was 297 million bushels--31 percent more than one year ago.

See table inside page.

MILK PRODUCTION UP

Montana dairymen produced 2 percent more milk during the January-March quarter than for the same period a year earlier in spite of no increase in number of cows. Compared with the October-November quarter, milk production was up 1 percent.

Production per cow last quarter averaged nearly 33 pounds per day.

For the Nation, January-March milk production at 33,955 million pounds was up 2 percent. Production per cow during the quarter averaged 34 pounds per day.

CROP-WEATHER SUMMARY

FOR WEEK ENDING APRIL 24, 1983:

CROPS: Soil moisture across most of Montana was lowered this past week as warm days and tillage operations had a drying effect. Topsoil moisture ranges between short and adequate, while subsoil moisture is mostly adequate. Although no range or crop damage has yet occurred because of dryness, a soaking rain would be welcome in most areas. The State's winter wheat crop remains in good condition. The crop in most areas is green and growing, especially with the warm days of last week. There were seven days suitable for field work last week which saw considerable progress being made in seeding spring grains. Spring wheat is 30 percent planted compared with a normal of 20 percent. Barley at 35 percent seeded compares with a normal of 20 percent. Sugarbeets are nearly 45 percent in the ground compared with a normal of 35 percent. Oats are 20 percent seeded, about normal.

LIVESTOCK: Calving is nearly 80 percent and lambing is about 75 percent complete. Ranges are either growing or starting to grow although growth has been limited until last week by cool weather. Stockwater is generally adequate. Livestock movement to summer ranges has already started in some southern parts of the State.

*FEATURING.....*WIBAUX COUNTY

Wibaux County lies in the extreme east central portion of Montana with its eastern boundary making up part of the Montana-North Dakota border line. Created in August of 1914, Wibuax County has a land area of 568,960 acres--the third smallest of the counties in Montana. Yet, it has the largest percentage of acres under cultivation. While it was known mainly as a stock district in the old range days, today crop production has taken predominance. The county ranked 27th in 1981 for wheat production, its major crop. Other crops produced in the county include hay, barley, oats and corn. Some livestock are raised although not to a great extent. In 1981 Wibuax County ranked 47th in number of cattle, 38th for number of sheep, and 45th for number of hogs.

Cash receipts from marketings for 1981 in Wibaux County totaled $9,445,000, nearly a five percent increase over 1980. Crops made up $5,287,000 of the total, while livestock and livestock products sales contributed $4,158,000. Wibaux ranked 47th in Montana for all cash receipts with $10,837,000. Livestock and crops receipts ranked 48th and 36th respectively.

The town of Wibaux is the county seat of Wibaux County. The normal precipitation for that area is 14.19 inches, with an average of 120 frost-free days.

FINE WOOL USE STRONG

Mill consumption of raw wool in 1982 was 114.8 million pounds, clean, 17 percent below the previous year. The strong mill demand for the finer grades continues. In both 1981 and 1982, about 60 percent of the raw wool for apparel in both the woolen and worsted systems was 60's and finer. Depressed consumer demand is expected to limit mill consumption in 1983 to around 112 million pounds.

The inventory of stock sheep on January 1, 1982 was reported to be 10.3 million, 10 percent below the previous year. It was the lowest number since estimates were started in 1867. Therefore, wool production in 1983 is forecast at 53 million pounds, clean, compared with 58.8 million in 1981 and estimated 58.6 million in 1982.

Because of the non-competitive nature of the domestic wool business, the mills have been operating with a minimum inventory, causing wool stocks to be maintained by wholesalers and producers.

MONTANA WOOL PRODUCTION DECREASES

Montana's 1982 wool production dropped 9 percent from 1981, following a national trend to fewer sheep. A more drastic change hit the value of the clip, down 30 percent from the year before. The state's sheep men were able to get a 3 percent increase in the amount of wool from each sheep sheared, but this was offset by a 12 percent decrease in number of sheep and lambs clipped.

Montana remained in 7th place nationally in total wool production. Texas, California, Wyoming, Colorado, South Dakota and Utah (ranked in order) all topped Montana. Nearly 91 percent of the Nation's wool is produced west of the Mississippi. The 11 western states produced 54 percent while Texas production accounted for 18 percent of the total.

LIVESTOCK CASH RECEIPTS UP

Montana livestock producers received 6 percent more in cash receipts for meat animals in 1982 compared with 1981. The increase was mainly the result of 15 percent more cattle and calf marketings, together with higher prices for hogs and pigs. Cash receipts in 1981 were 18 percent less than in 1980.

For the Nation, livestock cash receipts in 1982 were 3 percent above 1981.

WEATHER-CROP REPORT
MID-APRIL

CROPS: Montana's winter wheat crop remains in good condition with very little wind damage or winter kill reported. The crop is green and beginning to grow. Field work is underway in almost all areas and farmers are anxious to take advantage of present soil moisture conditions.

Planting of spring grains is underway and averages 5 percent completion for spring wheat and nearly 10 percent completion for barley. In the south central part of the state spring seeding is much more advanced.

Both topsoil and subsoil moisture is adequate. However, spring growth on pasture and ranges has been very slow due to cool weather.

LIVESTOCK: Unsettled weather, which is delaying field work, has not been detrimental to livestock. Nearly 65 percent of the calves and 50 percent of the lambs have been dropped. Supplemental feeding of hay is continuing.

MONTANA FARM PRICES STRENGTHEN

Prices received by Montana farmers during March generally increased for most major crop and livestock items. However, feed grains, hay hogs, milk, eggs and wool all saw price declines.

Compared with a year ago, prices for Montana grain, milk, eggs and wool are all lower. Hay and livestock prices are running higher than last year.

The over all March index of prices received by Montana farmers for all farm products was 154 (1977=100), up 3 points from February and up 2 points from a year ago. The all crops price index at 143 compares with 142 last month and 152 last year. The livestock price index at 164 compares with 158 last month and 153 a year ago.

MONTANA PASTURE and RANGE

Montana's pastures and ranges were reported in good to excellent condition over the whole state as of April 1, 1983. The state averaged 89 percent of normal--8 points above last April.

Current feed conditions are adequate on ranges with lots of old grass left over. If ample moisture continues, pastures and ranges should be in good condition for summer grazing.

FEATURING. . . . . CARBON COUNTY

Carbon County, situated in the south central portion of Montana, was established in March of 1895. It's northern boundary is marked by the Yellowstone River while the southwestern corner of the county is covered with part of the Custer National Forest and the Beartooth Mountain Range. Several unnamed mountain peaks in this range within Carbon County's boundaries boast elevations above 13,000 feet.

Coal mining was the chief industry in Carbon County early on, but today agriculture is the prominent business. With a land area of 1,324,160 acres, Carbon County ranked 8th in Montana in 1981 for hay production. Other principle crops include barley, wheat, corn and sugarbeets. Also in 1981, the county ranked 10th in sheep numbers and 17th for cattle numbers in Montana.

Carbon County returned $37,901,000 in cash receipts from marketings for the 1981 crop year, a 3% increase over 1980. Crops contributed $18,922,000 to that total, while livestock and livestock product sales made up the remainder with $18,979,000. In 1981 Carbon County ranked 16th in Montana for all cash receipts, livestock receipts ranked 11th and crops, 21st.

Red Lodge, the largest town in the county, is the county seat. The main agricultural areas are the Clark Fork and the Rock Creek Valleys, with important ranching activity in surrounding areas.

HIGHLIGHTS:

Hog Numbers Up
A Look at Montana Sheep & Lamb Losses
February Slaughter
Cattle on Feed Up
Cattle & Pork Outlook

HOG INVENTORY UP 3 PERCENT

Inventory of all hogs and pigs on March 1, 1983 in the 10 states conducting quarterly hog surveys is estimated at 41.6 million head, 3 percent above last March. This is 8 percent below March of 1981 and is the first increase in the March Inventory level since 1980.

--Breeding inventory, at 5.91 million head, was 6 percent more than a year ago but 9 percent less than March 1981. This is the first increase in the March breeding herd since 1979.

--Market hog inventory, at 35.7 million head, was 2 percent above last year but 8 percent below two years ago.

PIG CROP

The December 1982-February 1983 pig crop was 15.5 million head, 10 percent more than last year but 2 percent below two years ago. There were 2.08 million sows that farrowed during the past quarter, an increase of 5 percent from a year ago but 5 percent below the same period two years ago.

Sows farrowing averaged a record high 7.44 pigs per litter compared with 7.11 last year and 7.24 two years ago. The litter rate was the highest on record for a December-February quarter and second highest overall for the 10 quarterly states. The highest litter rate on record is 7.54 in March-May of 1981.

FARROWING INTENTIONS

Hog producers in the 10 quarterly states intend to farrow 2.58 million sows during March-May of this year. This is 8 percent more than during the comparable period in 1982 but 6 percent less than two years ago. Farrowing intentions for June-August are 2.35 million head, 7 percent above the same period last year but 5 percent less than two years ago.

MONTANA SHEEP & LAMB LOSS OVER 5 MILLION DOLLARS

Montana sheepmen lost 146,000 head of sheep and lambs in 1982 to predators, disease, weather and other death dealing causes. Lamb losses made up 66 percent of the total, with sheep loss accounting for the rest. The value of the loss came to $5.6 million. Of the total number lost, predators killed 34 percent, non-predator factors contributed 53 percent, and 13 percent was due to unknown causes.

COYOTE LOSS TOPS ALL OTHERS

Coyotes claimed 24 percent of the total number killed. Weather losses accounted for 17 percent, disease 13 percent and lambing complications 6 percent of the total number lost. Fox, eagle, old age and poison each killed 4 percent, while on-back caused 3 percent. Losses under 1 percent each were caused by bear, dog and bobcat.

Generally, predator loss was more severe in the larger operations, while weather and lambing complications hit the smaller flocks a little harder.

Sheep and lambs on farms in Montana on January 1, 1983 were valued at $28.3 million. Dollar loss due to predators was 6 percent of the inventory value, while non-predatory dollar loss amounted to nearly 11 percent.

COOPERATION

This study was undertaken at the request of the Montana Woolgrowers Association who also contributed the required funds for the survey.

1/ Average reported value January 1, 1982. Value $49.00 per head (Ewes 1+). 2/ Lamb value based on average monthly prices received by farmers for all lambs marketed during September, October and November 1982, converted to an average liveweight of 70 pounds. Value $32.80 per head.

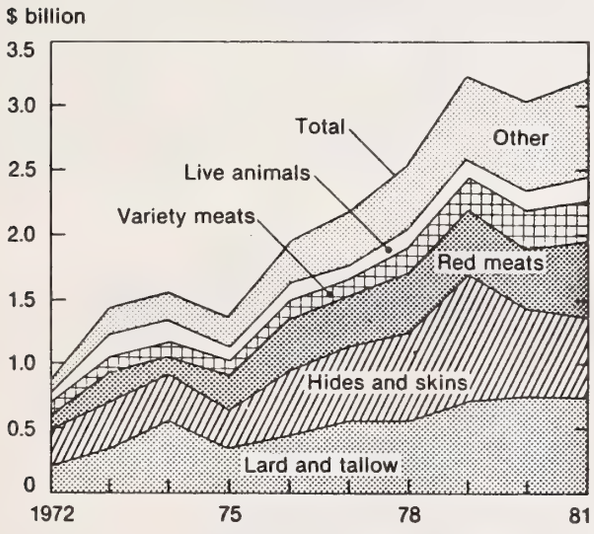
CATTLE OUTLOOK

With cattle slaughter up and the calf crop down, the cattle inventory declined 400,000 during 1982--totaling 115.2 million head at the beginning of 1983. Of significance to future beef production, beef cows and beef heifers being held for replacement purposes were down 3 and 4 percent, respectively, from a year earlier.

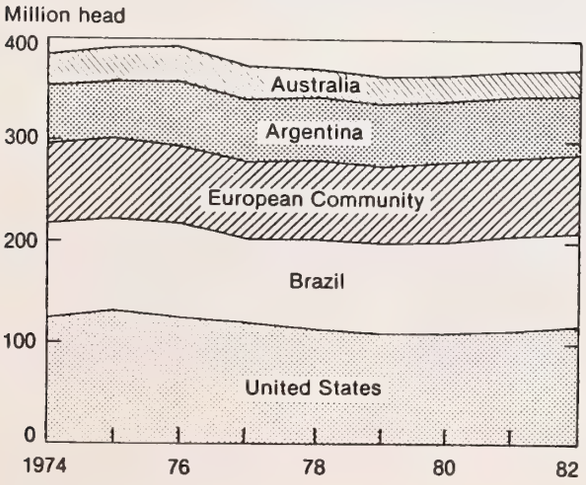
The debate about why the cattle inventory rose for only 3 years before declining has begun. Is the decline in numbers simply an interruption of a longer cycle that will soon reappear, or was this the century's shortest cattle cycle? While it will be some time before the answer becomes clear, the economic forces behind the inventory decline are understood: declining land values, high interest rates, cash-flow needs, a sluggish economy, and a slowdown of inflation.

With the decline, the cattle inventory is now not large enough to support a sustained increase in beef production during the next couple of years without further inventory reductions. Moreover, when the economy perks up this year and consumers spend more for meat, the resulting higher cattle prices--if sustained--will encourage producers to reduce heifer slaughter, retaining them for calf production instead.

U.S. Exports of Livestock Products

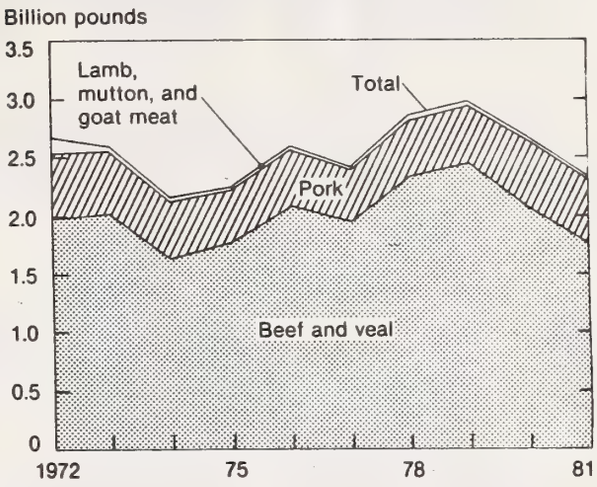


Cattle in Major Beef-Producing Countries



Inventory taken as close to January 1 as possible.

U.S. Imports of Red Meats

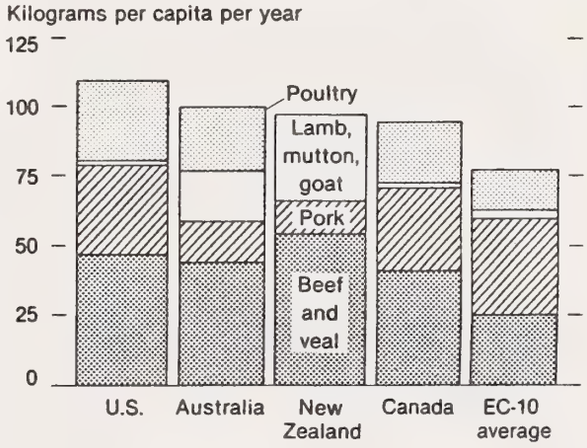


Carcass-weight basis.

PORK OUTLOOK

The outlook for pork production reflects the same economic forces affecting cattle. After dropping sharply in 1982, output will likely level this year. Although hog prices jumped to profitable levels last year, pork producers have not yet shown a clear inclination to sharply expand output. Instead, they are paying off old debts and using income from hog sales to provide cash flow and offset losses on their crop enterprises. Thus, decisions are being based on the health of the entire farm operation, not solely on the profitability of hogs.

Meat Consumption in Major Producing Countries



1981 data. A kilogram is about 2.2 pounds. Meat consumption is in carcass-weight basis. Poultry consumption data not available for New Zealand.

CATTLE ON FEED UP 11 PERCENT

Cattle and calves on feed for slaughter in the 7 major feeding states totaled 7.6 million head on March 1, up 11 percent from a year ago. Marketings of fed cattle during February at 15.1 million were up 7 percent. Placements in feed lots furing February at 1.18 million were down 11 percent.

FEBRUARY LIVESTOCK SLAUGHTER

Commercial cattle slaughter in Montana packing plants during February totaled 8,900 head. The January-February accumulated cattle kill is 18,900. The average weight of cattle slaughtered during February was 1,107 pounds.

Hog slaughter in the state during February was 33,400. The January-February accumulation is 72,800. Average hog weight was 240 pounds.

Commercial red meat production for the United States during February 1983 totaled 2.79 billion pounds.

Beef production totaled 1.71 billion pounds. Total head killed was 2.69 million and live weight averaged 1,084 pounds.

Veal production was 32 million pounds. Calf slaughter of 224 thousand head averaged 239 pounds.

Pork production during the month totaled 1.02 billion pounds. Hog kill totaled 5.96 million head. Average live weight for the month was 240 pounds.

Lamb and mutton production was 27 million pounds, head kill of 468 thousand averaged 115 pounds live weight.

POTATO STOCKS UP

Montana producers had 1.65 million cwt of potatoes in storage as of March 1, 1983--14 percent more than a year ago. The stocks represent 86 percent of production.

In the 15 major fall states there were 117 million cwt in store. This is up 5 percent from last March and 20 percent above two years ago.

In the three Eastern states, estimated holdings totaled 15.8 million cwt, 3 percent above last year and 14 percent above 2 years ago.

MONTANA FARM CASH RECEIPTS UP

Preliminary cash farm receipts data indicate Montana farmers and ranchers have taken in 9 percent more from the sale of commodities in 1982 than in 1981. Livestock receipts are up only slightly, while crops receipts show a nearly 16 percent increase.

For the Nation, cash receipts from marketings, at $1432.8 billion in 1982, are virtually unchanged from 1981.

CASH FARM RECEIPTS -- MONTANA

ITEM	1980	1981 1/	1982 2/
	-----million dollars-----		
Livestock	747.6	629.1	631.7

Total from Marketings 3/	1,405.2	1,483.3	1,619.1

1/ Revised. 2/ Preliminary. 3/ Excludes Government Payments.

MONTANA DAIRY PRODUCTS

Montana dairy plants produced 436,000 pounds of creamed cottage cheese during January--up 4 percent from a year ago. Ice cream production at 110,000 gallons was up 16 percent, while butter made at 227,000 pounds was down 15 percent. American cheese production at 221,000 pounds was up 45 percent.

WEATHER-CROP REPORT

The dry and mild winter has favored livestock raising and has been good to the State's winter wheat crop.

At mid-March, winter wheat was in fair to good condition statewide and greening. Although snow cover protection has been lacking for most of the winter, wind damage has been light.

Topsoil moisture is adequate in the northwestern and eastern districts and mostly short elsewhere. The shortages, although cause for concern, are posing no immediate problems. Subsoil moisture is adequate statewide.

Field tillage is starting in the southern areas and some operators have already completed seedbeds.

Calving and lambing weather has been ideal for most of the state, and by mid-March was over a third done. Livestock feed supplies are in adequate to surplus position.

WHEAT EXPORT UPDATE

Montana wheat is grown mostly for exports. Of the total Montana wheat utilized during the 1981 crop year, 71 percent went overseas, 18 percent was milled into flour, 4 percent was used for seed, 1 percent was fed to livestock with the remaining 6 percent unaccounted disappearance.

A review of the following tables reveals the following current wheat export factors:

1. The U.S. share of total wheat exports is down although we remain the largest exporter by far.
2. The Communist bloc countries, especially the U.S.S.R. and Mainland China, are taking larger share of total imports.
3. Of the major exporting countries, only Australia's production is down.

FEBRUARY FARM PRICES

Prices received by Montana farmers for livestock strengthened during February while crop prices mostly weakened. Beef cattle, hog and lamb prices are higher than both last month and last year levels. Sheep prices are up from last month but still under a year ago. Wheat prices are running under last year mainly due to big declines in hard red spring and durum. Compared with last month wheat prices are only slightly weaker, except for durum which went down more sharply.

The overall February prices received index for Montana at 151 (1977=100) compares with 144 in January and 148 in February last year. The livestock price index at 156 is up 11 points from both last month and last year. The crops price index at 144 is the same as last month, but 9 points under last year.

AGRICULTURAL EXPORTS POINT DOWN

U.S. agricultural exports are now forecast at $36 billion for fiscal 1983, about $3 billion below last year. Export unit values are expected to decline again after last year's drop, and volume may also fall slightly. Although U.S. farm prices are low, shipments of U.S. farm products continue to be hurt by record global supplies, the economic recession, the high-valued U.S. dollar, foreign exchange constraints, and debt problems in many importing countries.

FOOD PURCHASES TO RISE

Consumer expenditures for domestically produced foods are expected to rise 5 to 8 percent in 1983, pushed up by moderate changes in the price and per-capita quantity of food consumed--plus a 1 percent increase in population. The farm value of food is expected to rise only 1 to 4 percent this year, but marketing costs are forecast up 4 to 7 percent.

WOOL PRICE OUTLOOK GLUM

Low production, use, and prices mark this season's wool market. Sheep numbers on January 1, 1983, were 10.3 million, 10 percent below a year earlier and the lowest since recordkeeping began in 1867. Mill use in 1982 was 115 million pounds, 17 percent below 1981. February farm prices averaged 57.7 cents a pound, greasy, the lowest price for that month since 1975.

LIVESTOCK PRODUCERS LIMITING 1983 OUTPUT

Livestock producers' returns improved during 1982--a change that normally would suggest a general expansion of livestock output this year. However, red meat production for 1983 is currently forecast to show little, if any, recovery from last year's decline. Faced with weak overall farm financial conditions, producers seem more concerned with keeping their farm operations vaible. As the farm sector has grown more integrated into national money markets and the overall economy, farmers have had to consider ways to enhance their cash-flow position and improve their ability to secure operating funds for future production. At times, these decisions seem to run counter to cash-price signals.

LIVESTOCK SLAUGHTER--JANUARY 1983

Montana's slaughter plants produced 12.5 million pounds of red meat during January. Cattle slaughter was 10,100, and hog slaughter totaled 39,300 head.

Commercial red meat production for the United States during January 1983 totaled 3.15 billion pounds. Commercial red meat production includes slaughter in Federally inspected and other plants, but excludes animals slaughtered on farms.

Kill days for January 1983 included 21 weekdays and 5 Saturdays (one a holiday).

Beef production totaled 1.93 billion pounds. Total head killed was 3.06 million and live weight averaged 1077 pounds per head.

Veal production was 34 million pounds. Calf slaughter of 244 thousand head averaged 237 pounds live weight.

Pork production during the month totaled 1.16 billion pounds. Hog kill totaled 6.67 million head. Average live weight for the month was 244 pounds.

Lamb and mutton production was 30 million pounds. Head kill of 522 thousand averaged 113 pounds live weight.

Last year slaughter totals were reported for the January-March period, so comparisons with January of 1982 are not available.

SPRING CROP INTENTIONS DOWN

Montana farmers intend to seed 11 percent fewer acres to spring sown crops in 1983 compared with last year, based on a February 1 planting intentions survey. Nearly 97 percent of all spring crops in Montana are hard spring wheat, durum, oats and barley. Nationally, spring crop plantings are also expected to be down 11 percent.

National highlights are:

Corn -- down 15%
Sorghum -- down 19%
Oats -- up 4% (Montana up 15%)
Barley -- unchanged (Montana up 9%)
Hard Spring Wheat -- down 16% (Montana down 20%)
Durum -- down 32% (Montana down 57%)
Soybeans -- down 5%
Sunflower -- down 23%
Dry Beans -- down 22% (Montana unchanged)
Sugarbeets -- up 4%
Hay for harvest -- up 3% (Montana down 2%)

This report is intended to help growers plan their crop program for 1983. Final planted acres will depend upon farm program participation, weather, farm supply costs, and expected prices for 1983 crops.

PROSPECTIVE PLANTING -- FEBRUARY 1

CROP	MONTANA		UNITED STATES	
	1982 1/	1983 2/	1982 1/	1983 2/

WHEAT MOVEMENT and UTILIZATION

Montana wheat shipped to out-of-state destinations in the 1981 marketing year (June 1981 - May 1982) is estimated at 143.6 million bushels--including unaccounted disappearance. This is 40 percent more than the previous year. Movement to out-of-state destinations accounted for 90 percent of the total disposition.

The amount headed for Pacific Northwest areas was 134.5 million bushels and represents 94 percent of out-of-state movement. In the Pacific Northwest, the wheat was divided into that destined for overseas shipment--114.0 million--and that for use in milling flour and bulgar products--20.5 million bushels.

Montana wheat made up 68 percent of all wheat leaving the Pacific Northwest ports in the June 1981 - May 1982 marketing period.

ALL WHEAT PRODUCTION, STOCKS and UTILIZATION
1978 - 1981 MARKETING YEARS

MORE POTATOES ON HAND

On February 1, 1983 there were 1,750,000 cwt of potatoes in Montana storages--9 percent more than last year.

For the 15 major fall potato producing states there were 144,950,000 cwt in storage, a 6 percent increase from last year. Idaho storages held 4 percent more than last year, Oregon was up 8 percent and Washington was up 2 percent. The total 1982 crop in the 15 states was 3 percent larger than a year ago.

By February 1, 10 percent fewer potatoes had been utilized for processing in Idaho and Malheur County Oregon, and 5 percent less in Washington and other areas in Oregon.

In the 11 objective yield states, 75 percent of all storage potatoes were Russets, 22 percent whites and 3 percent reds.

MEAT CONSUMPTION

During 1982, total per capita consumption of red meat and poultry was down 2 percent from the 208 pounds (retail-weight basis) consumed in 1981. Total poultry consumption was up 2 percent, but red meats were down 4 percent. Per capita beef consumption was about the same as in 1981, but pork consumption fell nearly 8 pounds from the 65 pounds per person consumed in 1981. Poultry consumption rose a little over 1 pound to nearly 64 pounds, with nearly all of the rise occurring in broiler production.

Per capita meat consumption is expected to decline again in 1983. Beef consumption may be up slightly, while pork consumption is expected to be down almost 4 pounds. The rate of increase in poultry consumption will slow to a gain of less than 1 pound.

During 1982, retail prices of red meats increased as supplies were curtailed. Retail beef prices rose 1 percent to a new high of $2.42 a pound in 1982. In 1982, retail pork prices rose 15 percent to $1.75 a pound. Poultry prices declined about 2 percent.

MONTANA'S FUTURE BEEF HERD TO SHRINK?

Montana's January 1 cattle and calf inventory at 2.99 million head is up 3 percent from last year.

The state's cattle inventory has been going up each year since 1979. However, this year's increase is due solely to the larger holdover of last year's calf crop. Since beef cows were down 5 percent, and replacement heifers down 14 percent, a future decline in the state's beef herd is indicated.

The total value of the inventory on hand January 1, 1983 was $1.1 billion--down 2 percent from last year.

CATTLE and CALF INVENTORY -- JANUARY 1, 1982-1983

NATION'S CATTLE HERD DOWN SLIGHTLY

The nation's cattle inventory at 115 million head on January 1 is down 1 million from a year ago. However, the beginning year inventory figures reveal a definite beef breeding herd liquidation trend. Beef cows and replacement heifers were down 4 and 3 percent respectively. Cow slaughter was up 11 percent for the year, producers added a smaller percent of available replacement heifers to their herds than the year before, and heifers placed in feedlots increased.

The reasons for the cutbacks are not mysterious. Beef enterprise profits didn't keep up with cost increases, and many cattle men suffered cash flow problems because of high interest rates. Beef cattle prices averaged nearly 7 percent less during 1982 compared with 1981.

The trend could reverse itself in short order or it could continue it's downward slide. One major factor favoring the beef industry is that it does not have a surplus disposal problem to contend with before it can regain economic health.

If market prices signal beefmen to produce more, the ingredients for herd expansion are already in place. A much higher proportion of the available heifers could be saved for herd expansion--and there's 11 percent more other heifers on hand to choose from. Cow slaughter could be cut back substantially. The PIK program will take corn and grain sorghum out of the farmer owned reserve and make it available for sale. This year's mild winter weather will no doubt increase hay carryover, and current interest rates are making financing more palatable.

SHEEP NUMBERS DECLINE

Montana's January 1 sheep and lamb inventory was 9 percent less than last year, reversing the trend of a three year buildup in numbers. Breeding ewes 1 year old and over were down 7 percent from last year. The decrease in breeding stock would indicate sheepmen are planning to raise even fewer sheep for the coming year.

AGRICULTURAL ECONOMY

The outlook for agriculture in 1983 remains clouded by large crop supplies worldwide combined with a weak global economy--pointing to low crop prices and poor income prospects for many U.S. farmers. World carryover stocks of all grains will likely rise about 40 million metric tons this season, as they did last season. With nearly all of this buildup occurring in the United States, this country will hold 74 percent of the world's coarse grain stocks and 44 percent of its wheat stocks by the end of 1982/83. In addition, the United States could hold 60 percent of global soybean stocks and 26 percent of the cotton stocks. These huge stocks, plus the strong dollar, are expected to keep U.S. crop prices low.

Weakness in the global economy and limited growth in livestock production have reduced feed requirements nearly everywhere. In the United States, total output of red meats and poultry is anticipated to decline about 3 percent in 1983, and world production is not expected to advance noticeably. The resulting weak demand for feed will intensify the price-depressing effect of large U.S. stocks.

INCOME and FINANCE UPDATE

The current assessment for net farm income in 1982, after adjusting for inventory changes, is still $19.0 billion, down from $25.1 billion in 1981 and $20.1 billion in 1980. Cash income from farming is estimated at about $31 billion for 1982, down about 2 percent from the previous year's level despite large direct Government payments of about $4 billion.

WHEAT STOCKS RECORD HIGH

Wheat stored on Montana farms and in mills and elevators January 1, 1983 totaled 200.5 million bushels, a record high for this date and 27 percent more than a year ago. Disappearance since October 1 was 37.9 million bushels, down 11 percent from a year ago. Farm storages held 172.5 million bushels--31 percent above a year ago and commercial storages held 28.0 million--up 4 percent.

Winter wheat holdings at 88.8 million bushels were up 9 percent from last year. Spring wheat stocks excluding durum were 94.6 million bushels up 47 percent from a year ago. Durum in storage amounted to 17.1 million bushels--up 37 percent.

Barley stocks at 51.2 million bushels were up 57 percent and oats stocks at 7.3 million were up 67 percent.

Nationally, all wheat stored in all positions on January 1, 1983 totaled a record high 2.52 billion bushels, 16 percent more than last year's 2.18 billion bushels and 32 percent more than January 1, 1981. Farm stocks amounted to 1.17 billion bushels or 46 percent of the total January 1, 1983 wheat stocks. Off-farm stocks on January 1, 1983 totaled 1.35 billion bushels, 11 percent more than the January 1, 1982 total of 1.22 billion bushels. Indicated disappearance during the October-December 1982 quarter totaled 466 million bushels. Disappearance for the comparable period a year ago was 557 million bushels.

Barley stored in all positions on January 1, 1983 totaled 419 million bushels, 26 percent more than a year earlier. Stocks of barley stored on farms amounted to 294 million bushels or 70 percent of the total stocks. Off-farm storages held 125 million bushels on January 1, or 30 percent of the total stocks. On-farm stocks were up 27 percent and off-farm were up 22 percent from January 1, 1982.

(See tables on inside pages.)
